The Abbé Montesquieu, Minister of the Interior during the first Restoration of the Bourbons, instituted a chair of Chinese at the Collège de France, and R. was named professor, 9th November 1814. He delivered a splendid inaugural address in January 1815, an analysis of which appeared in the *Moniteur* of 1st February, executed by Silvestre de Sacy himself. Of the numerous works that he wrote subsequent to this period, we may mention *Recherches sur les Langues Tartares* (1820), a work in some sort preparatory to his *Éléments de la Grammaire Chinoise* (1822), the grandest monument of the vast Sinological erudition and labor of Remusat. Another of his important philological productions was his *Recherches sur l'Origine et la Formation de l'Écriture Chinoise* (1827). 'Although acquainted,' says M. Walckenaer, 'with several of the most difficult languages of Asia, and with almost all the ancient and modern languages of Europe, he regarded such knowledge as only a means to an end. . . . In a crowd of treatises, dissertations, critical analyses, and translations, either published as separate works or inserted in *Mémoires*, he has endeavored to embrace everything relating to the nations whom he proposed to make known. Religious beliefs, philosophical systems, national history, geography, political revolutions, the origins of races, biography, literature, manners, habits, and customs—he

has treated all in an equally masterly style.' Among the works of R. which illustrate this *éloge* of M. Walckenaer are his *Etude Historique sur la Médecine des Chinois; Tableau Complet des Connaissances des Chinois en Histoire Naturelle* (unfinished); *Sur la Pierre Iu* (a curiously learned disquisition on a crowd of historical questions and religious rites); *Notice sur la Chine et ses Habitants* (in which the author treats of the extent, administration, manners, commerce, &c., of China); *Sur l'Extension de l'Empire Chinois en Occident depuis le Premier Siècle avant Jésus-Christ jusqu'à nos Jours*. R. was the first to make known in Europe the life and opinions of the philosopher Laou-Tsze, head of the religious sect *Taou-tsé*, and wrote on the history of Buddhism. In 1818, R. became one of the editors of the *Journal des Savants*; in 1822, he founded the *Société Asiatique* of Paris; and in 1824, he was appointed curator of the Oriental Department in the Bibliothèque Royale. He died of cholera at Paris, 4th June 1832, at the early age of 44.

RÉMUSAT, MADAME DE, the mother of Count Charles de R. above mentioned, was born at Paris, 5th Jan., 1780. Her maiden name was Gravier de Vergennes. In 1796, she married the Count de R., who held various important posts under Napoleon. In 1803, Madame de R., who was remarkable for wit and ability, became maid of honor to Josephine, and remained in her service till the divorce. She left very interesting and valuable *Mémoires* of her experiences at court, and her impressions of Napoleon and his surroundings, which were published in 1879 and 1880 (2 vols.).

REMY, or REMI, St. (Lat. *Remigius*), a saint of the Roman Catholic Church, was born of a noble family of Laon, in Picardy, in the year 438 or 439. He was appointed against his will, at the early age of 22, to the bishopric of Rheims, and his episcopate is memorable for the conversion of Clovis, who was baptized by Remy. It was on occasion of this ceremony that, contrasting our Lord and his cross with the idols whom Clovis had hitherto adored, R. used the words which afterwards became almost epigrammatic: 'Adore henceforward what thou hast hitherto burned, and burn that which thou hast adored.' R. lived to see Gaul almost entirely christianized, and died in his 93d or 94th year in 533. Some of his letters are preserved in the *Bibliotheca Patrum*, as also two documents under the title of *Testamenta*, the genuineness of which has been the subject of a curious controversy.

RENAISSANCE, the name given to the style of art, especially architecture, in Europe, which succeeded the Gothic, and preceded the rigid copyism of the classic revival in the first half of the present century. Under the heading ITALIAN ARCHITECTURE

Fig. 1.—Chateau of Chambord.

we have traced the rise and progress of the Renaissance in the country of its birth. The spread of classical literature during the 15th and 16th centuries created a taste for classic architecture in every country in Europe. France, from her proximity and constant intercourse with Italy, was the first to introduce the new style north of the Alps. Francis I. invited Italian artists to his court during the first half of the 16th century. The most dis-

tinguished of these were Leonardo da Vinci, Benvenuto Cellini, Primaticcio, and Serlio. These artists introduced Italian details, and native architects applied them to the old forms to which they were accustomed, and which suited the purposes of their buildings, and thus originated a style similar to, though diverse from, that of Italy.

The Italian buildings were chiefly churches, St. Peter's being the great model. In France (as in the other countries north of the Alps), the stock of churches was more than was required. The grand domestic buildings of Florence and Rome were actually needed for defence, and were founded in design on the old mediæval castles, which the nobles occupied within the cities. The domestic architecture of France is rather taken from the luxurious residences of the monks, and although very graceful in outline and in detail, its buildings want the force and grandeur of the Italian palaces.

In the French Renaissance, so much are the old Gothic forms and outline preserved, that the buildings of Francis I. might, at a short distance, be mistaken for Gothic designs, although, on nearer approach, all the details are found to be imitated from the classic. Such are the palaces of Chambord and Chenonceaux on the Loire, Fontainebleau, and many others. The churches of this period are the same in their principles of design. Gothic forms and construction are everywhere preserved, while the detail is as near classic as the designers could make it. St. Eustache, in Paris, is one of the finest examples of this transitional style.

From the middle of the 16th to the middle of the 17th c., a style prevailed which may be said to have combined all the defects of the Renaissance. It was neither classic nor Gothic. It

Fig. 2.—Central Pavillon of the Tuileries, As designed by De Lorme (from Mariette).

had no principles of construction or decoration save the individual caprice of the designer. This style, usually known as that of the time of Henry IV., is the basest which has been adopted in France, and has no redeeming qualities. It may be distinguished by the constant use of meaningless pilasters, broken entablatures, curved, and contorted cornices, architraves, &c., all applied so as to conceal rather than to mark and dignify the real uses of the features of the buildings. The Tuileries, wrecked by the Commune, showed all these defects. From this debased and meaningless style, architecture gradually recovered, and during the 18th c., a style more becoming the dignity and importance of the *Grand Monarque* was introduced. The classic element now began to prevail, to the entire exclusion of all trace of the old Gothic forms. Many very large palaces are built in this style;

but, although grand from their size, and striking from their richness and luxuriance, they are frequently tame and uninteresting as works of art. The palace of Versailles (q. v.) is the most prominent example. The two Mansards, one of whom designed Versailles, had great opportunities during this extravagant epoch. Their invention of giving a row of separate houses the appearance of one palace, which has ever since saved architects a world of trouble, was one of the most fatal blows which true street-architecture could have received.

The east front of the Louvre, designed by Perrault, is one of the best examples of the style of the age. Many elegant private hôtels and houses in Paris were erected at this period. The most striking peculiarity of the style of Louis XIV. is the ornament then used, called Rococo (q. v.).

The classic Renaissance was completed in the beginning of the present century by the literal copyism of ancient buildings. Hitherto, architects had attempted to apply classic architecture to the requirements of modern times; now they tried to make modern wants conform to ancient architecture. In the Madeleine, for instance, a pure peripteral temple is taken as the object to be reproduced, and the architect has then to see how he can arrange a Christian church inside it! Many buildings erected during the time of the Empire are no doubt very impressive, with noble porticoes and broad blank walls; but they are in many respects mere shams; attempts to make the religious buildings of the Greeks and Romans serve for the conveniences and requirements of the 19th century. This has been found an impossibility—people have rebelled against houses where the window-light had to be sacrificed to the reproduction of an ancient portico, and in which the height of the stories, the arrangement of the doors, windows, and, in fact, all the features were cramped, and many destroyed. The result has been that this cold and servile copyism is now entirely abandoned, and the French are working out a free kind of Renaissance of their own, which promises well for the future; and is, at the present moment, as the streets of Paris testify, the liveliest and most appropriate style in use for modern street-architecture.

In Spain, the Renaissance style took early root, and from the richness of that country at the time, many fine buildings were erected; but it soon yielded to the cold and heavy 'Greco-Romano' style, and that was followed by extravagances of style and ornament more absurd than any of the reign of Louis XIV. The later Renaissance of Spain was much influenced by the remnants of Saracenic art which everywhere abound in that country.

In England, as in the other countries of Europe, classic art accompanied the classic literature of the period; but, being at a distance from the fountain-head, it was long before the native Gothic style gave place to the classic Renaissance. It was more than a century after the foundation of St. Peter's that Henry VIII. brought over two foreign artists—John of Padua and Havenius of Cleves—to introduce the new style. Of their works, we have many early examples at Cambridge and Oxford, in the latter half of the 16th century.

Longleat, Holmby, Wallaton, and many other county mansions, built towards the end of the 16th c., are fine examples of how the new style was gradually introduced.

The course of the Renaissance in England was similar to its progress in France; it was even slower. Little classical feeling prevailed till about 1620. The general expression of all the buildings before that date is almost entirely Gothic, although an attempt is made to introduce classical details. The pointed gables, mullioned windows, oriels and dormers, and the picturesque outlines of the old style, are all retained long after the introduction of quasi-classic profiles to the mouldings. This style, which prevailed during the latter half of the 16th c., is called Elizabethan, and corresponds to the somewhat earlier style in France of the time of Francis I. This was followed in the reign of James I. by a similar but more extravagant style called Jacobean, of which Heriot's Hospital is a good example; the fantastic ornaments, broken entablatures, &c., over the windows, being characteristic of this style, as they were of that of Henry IV. in France.

The first architect who introduced real Italian feeling into the Renaissance of England was Inigo Jones. After studying abroad, he was appointed superintendent of royal buildings under James I., for whom he designed a magnificent palace at Whitehall. Of this, only one small portion was executed (1619–1621), and still exists under the name of the Banqueting House, and is a good example of the Italian style. Jones also erected several elegant mansions in this style, which then became more generally adopted.

In the latter half of the 17th c., a splendid opportunity occurred for the adoption of the Renaissance style after the great fire of London. Sir Christopher Wren rebuilt an immense number of churches in that style, of which St. Paul's (q. v.) was the most important. The spire of Bow Church and the interior of St. Stephen's, Wallbrook, are also much admired.

During the 18th c., classic feeling predominated, and gradually extended to all classes of buildings. In the early part of the

century, Vanburgh built the grand but ponderous palaces of Blenheim and Castle Howard, which have a character and originality of their own. To these succeeded a vast number of noblemen's mansions, designed by Campbell, Kent, the Adamsons, and others.

Fig. 3.—Park Front of Castle Howard.

Many of these, like the contemporaneous buildings of France, are of great size and magnificence; but they are usually tame and cold in design, and a sameness pervades them all. They generally consist of a rustic basement-story, with a portico over the center, and an equal number of windows on either side. The portico is considered essential, and although perfectly useless, the light and convenience of the house are invariably sacrificed for it.

The further study of the buildings of Greece and Rome led, in the beginning of the present century, to the fashion of reproducing them more literally. All important public buildings were now required to be absolute copies of ancient buildings, or parts of them or to look like such, and then the architect had to work

Fig. 4.—Part of Park Front of Bridgewater House.

out the accommodation as best he might. St. Pancras' Church in London is a good example. It is made up of portions from nearly every temple in Greece! Many really successful buildings, such as St. George's Hall, Liverpool, the High School and Royal Institution in Edinburgh, have been erected in this style; but they owe their effect not to their being designs well adapted to their requirements, but to the fact that they are copies from the finest buildings of antiquity.

Sir Charles Barry was the first to break away from this thrall-dom, and to return to the true system of designing buildings—those, namely, which have their general features arranged so as not only to express the purposes they are intended to serve, but in so doing to form the decorative as well as the useful features of the buildings. The Travelers' Club-house and Bridgewater House in London are admirable specimens of his design. There are no superfluous porticoes or obstructive pediments, but a pleasing and reasonable design is produced by simply grouping the windows, and crowning the building with an appropriate cornice.

As already noticed, a similar style of domestic architecture is now being worked out in France; but both there and in this country there has been a reaction against everything classic, and a revival of medieval architecture has superseded that of classic, especially in ecclesiastical buildings. A very large number of churches has been erected within the last 20 years in the Gothic style, but it cannot be said that these are usually well adapted to the modern Protestant service. The most magnificent example of this style is the Palace or Houses of Parliament at Westminster.

In Germany, Russia, and every country of Europe, the Renais-

sance prevailed in a manner similar to that above described. In Germany, there are few specimens of early Renaissance, the picturesque castle at Heidelberg being almost unique as an early example. The Zwinger and the Japanese palace at Dresden, which are nearly alone as edifices of the beginning of the 18th c., show how poor the architecture of Germany then was. In the domestic buildings of Nuremberg, Dresden, and other towns of the north of Germany, there are many instances of the picturesque application of classic detail to the old Gothic outlines.

One of the most striking examples of the revival of classic art occurred in Bavaria during the first half of the present century, under the auspices of King Louis. He caused all the buildings he had seen and admired in his travels to be reproduced in Bavaria. Thus, the royal palace is the Pitti Palace of Florence on a small scale; St. Mark's at Venice is imitated in the Byzantine Chapel-royal; and the Walhalla, on the banks of the Danube, is an exact copy (externally) of the Parthenon. The finest buildings of Munich are the Picture-gallery and Sculpture-gallery by Klenze, both well adapted to their purpose, and good adaptations of Italian and Grecian architecture.

In Vienna and Berlin, there are many examples of the revived Classic and Gothic styles, but the Germans have always understood the former better than the latter. The museums at Berlin, and many of the theaters of Germany, are good examples of classic buildings.—The domestic architecture of Berlin is well worthy of notice, many of the dwelling-houses being quite equal in design to those of Paris.

Of the other countries of Europe, the only one which deserves remark for its Renaissance buildings is Russia. St. Petersburg is, of all the cities of Europe, the one which best merits the title of a city of palaces. From the date at which the city was founded, there are necessarily all Renaissance in character. They are nearly all the works of German or Italian architects, and are unfortunately, for the most part, in the coldest and worst style. The ornaments of the palaces are chiefly pilasters running through two stories, with broken entablatures, &c., and ornaments of the flimsiest rococo. The New Museum, by Klenze, is, however, a marked exception.

Along with architecture, during the period of the Renaissance, Painting and Sculpture (q. v.) and all the other arts took their models from the classic remains which were so carefully sought for and studied. All ornamental work, such as carving, jewelry, and metal-work of all kinds, followed in the same track. Medieval niches and pinnacles gave place to the columns and entablatures of the classic styles, and the saints of the middle ages yielded to the gods and goddesses of ancient Rome.

RENAIX, a town of Belgium, in the province of East Flanders, picturesquely situated, 24 miles by railway south of Ghent. Brewing, tanning, distilling, and salt-refining are carried on; and fine linen and damasks, woollen fabrics, hats, and tobacco, are extensively manufactured. Pop. (1876) 14,089.

RENAN, JOSEPH ERNEST, a renowned French theologian and orientalist, was born in 1823 at Tréguier (Côtes-du-Nord). His first education he received at the hands of the priests who directed the school of his native place. At sixteen years of age, he was sent to Paris, where he entered the seminary of Abbé Dupanloup, to prepare himself for the church. Three years later, he went to Issy, and having completed his philosophical studies there, to St. Sulpice. On leaving this, however, he declared himself unable to follow out the path traced for him. The theological and linguistic studies, to which he had devoted himself with rare industry, had led him to results which did not seem to allow him the exercise of priestly functions in his church. He took the place of *répétiteur* in a school, and here prepared himself for an academical career.

In 1847, his Memoir *Sur les Langues Sémitiques* ('On the Semitic Languages') obtained the Volney Prize; and the following year, another Memoir of his, *Sur l'Étude du Grec dans l'Occident au Moyen Âge* ('On the Study of Greek in the West during the Middle Ages') was crowned. In 1848, he began to publish a periodical, *La Liberté de Penser* ('Liberty of thought'), in which he embodied some of his most brilliant essays on theology, philosophy, philology, history, and the many variegated branches of his studies, which, however, were all merely preparatory to the great work for which he concentrated all his energies—viz., the investigation of the origin of Christianity, which, according to him, is as human and natural, and has grown out of the history and circumstances of the times, in precisely the same manner as any other event in the records of humanity. His Memoir, *Sur les Langues Sémitiques* he expanded in 1855 into a *Histoire Générale des Langues Sémitiques* ('General History of the Semitic Languages'), which, with all its shortcomings, is the most methodical and brilliant compilation on the subject. Of the variety of subjects to which he devoted his time besides, his numerous contributions to the *Revue des Deux Mondes* and the *Journal des Débats*, bear ample witness. In 1850, he published a historical essay, *Sur Averroès et l'Averroïsme*,

for which he had collected materials on a scientific journey to Italy. In consequence of this he was appointed *Employé* at the Imperial Library in Paris. He further produced translations of Canticles and the Book of Job, with introductions and commentaries (*Le Cantique des Cantiques*, &c., 1860, et *Le Livre de Job*, &c., 1859). In 1860, he was sent by the Emperor on a tour of exploration to Syria and Phœnicia, the results of which were given to the world in the *Mission de Phénice* (1864) and other works. On his return, he was elected to the chair of Hebrew professorship at the Collège de France; but his inaugural lecture made him, through its too free handling of theological matters, so obnoxious to those in power, that his course was first suspended, and finally his professorship was taken from him.

His work, *La Vie de Jésus*, forming part I. of his *Origines du Christianisme*, created a profound emotion throughout Europe. An abstract of it, in a more popular form, has been published by him under the title *Jésus. Histoire des Apôtres* (1866), *Saint-Paul* (1869), *Antichrist* (1873), *Les Évangiles* (1877), *L'Eglise Chrétienne* (1879), and a volume on the reign of Marcus Aurelius, complete the series. Other works are: *Études d'Histoire Religieuse* (1856), *Essais de Morale et de Critique* (1859), *La Réforme Intellectuelle et Morale* (1872), *Dialogues et Fragments Philosophiques* (1876), *Mélanges d'Histoire et de Voyages* (1878), the Hibbert Lectures (1880), delivered in London, on the Influence of Roman Thought on Christianity, and his curious poem *Caliban* (1878). R. was elected a member of the Academy in 1878.

RE'NDSBURG, a town in the Prussian province of Schleswig-Holstein, stands at the junction of the Eider and the Kiel Canal, 67 miles N.N.W. of Altona. R. has an active trade. Pop. (1880) 12,776.

RENÉ, or RENATUS I., surnamed 'the Good,' titular king of Naples and Sicily, the son of Louis II., Duke of Anjou and Count of Provence, was born in 1408 at Angers. R.'s paternal grandfather, Louis I., duke of Anjou, and second son of John the Good, king of France, had been adopted in 1380 by Joanna I., queen of Naples, as her successor, and on his death, a few years afterwards, his son, R.'s father, was crowned king of Naples and Sicily. He, however, did not derive any substantial advantages from this recognition of his presumed rights; and when, on his death and that of his eldest son Louis II., R., as the next heir, endeavored to make good his pretensions to the great Neapolitan heritage, he found himself involved in disastrous disputes with numerous other aspirants to the coveted throne. R. had married Isabella of Lorraine, and through her was also a claimant of the rich territories of Lorraine, and consequently brought upon himself the enmity of his wife's brother-in-law, the Duke of Burgundy, who laid equal claim to the heritage of the ducal House of Lorraine.

The best years of R.'s life were spent in the fruitless effort to establish these pretensions; but when, in 1442, his powerful rival, Alfonso of Aragon, took Naples, after a protracted siege, the struggle was virtually decided; and R., recognizing at length the futility of his schemes, retired to his hereditary dominions in Provence, and thenceforth occupied himself with the administration of his territories, and with the cultivation of poetry and painting, in both of which he attained a degree of proficiency above the average of his age, as is shown by the poems and illuminated illustrations by his hand still preserved in the Imperial Library at Paris. In 1445, R. gave his beautiful daughter Margaret in marriage to Henry VI. of England, and at the same time obtained from his royal son-in-law the restitution of Anjou and Maine, which had remained in the hands of the English since the successful wars of Henry V. This did not, however, prevent R. from taking part in the wars of Charles VII. against the English in 1449; but after a brief stay with the army, R. wearied with the excitement and discomforts of war, retired to Aix in Provence, where for many years he attracted to his court the cultivators of song and romance, while he encouraged manufactures, and augmented the resources of the province by the introduction of improved methods of agriculture, and the importation of various useful trees and plants, and died in 1480, universally regretted by his subjects, among whom the memory of 'the good king René' was long held in great veneration. R.'s sons had died before him; and as with him the House of Anjou became extinct, its territorial dominions lapsed to the French crown, and have since that period formed an integral part of France.

RENEW'AL of a Bill of Exchange is matter of agreement between the parties, and a new bill is granted by the party liable to pay in substitution for the old one. The result is, that the former bill is suspended in its operation till the renewed one arrives at maturity. But the former one is not extinguished, for it revives if the renewed bill is not paid; and even though the renewed bill is paid, an action may be brought on the former bill to recover the interest due upon it.

RE'NFREW (anciently *Strathgruffe*), a county in Scotland, 31 miles long, by 13 broad, is bounded on the N. and W. by the river

and Firth of Clyde, on the S. by Ayrshire, and on the E. and N. by Lanarkshire. Area, 254 sq. m., or 162,428 acres; pop. (1861) 177,561; (1871) 216,947; (1881) 263,374.

R. is very unequal in its surface, and consequently in the nature and quality of its soil; the highest portion of it, composing two-thirds of its surface, reaches to the height of 1240 feet above the level of the sea, and gradually declines to a level extending to some 12,000 acres. R. was divided in 1815 into the Upper and Lower Wards, with a sheriff-substitute for each. Owing to the great demand for dairy produce in the large towns in or near the county, nearly two-thirds of the arable land is kept under grasses. There are extensive mineral deposits in the county, employing a large number of people, and constituting a great source of commerce and wealth. The minerals wrought are coal (accompanied always by iron), limestone, and sandstone. In respect of commercial and manufacturing importance, R. is second only to Lanark of Scotch counties. The manufacture of soft goods, comprising silk, cotton, and muslin fabrics, is carried on to a great extent. The center of these branches of industry is Paisley; but weaving is carried on in almost every village in the county. The good roads and railways, together with the seaports of Greenock and Port Glasgow, afford ready means of transit both for home and foreign trade. The chief towns, besides these ports, are Renfrew (q. v.), Paisley (q. v.), and Johnstone (q. v.). Besides the Clyde, and some small streams, there are three rivers of considerable size, called the Black Cart, the White Cart, and the Gryffe. Of the whole acreage of R., there were, in 1880, 94,339 acres under all kinds of crops: 17,712 acres were under corn crops, 8494 under green crops, 18,321 in clover and grasses under rotation, and 49,467 in permanent pasture. There were in the county in the same year 2900 horses kept for agricultural purposes, 25,059 cattle, 81,387 sheep, and 1810 pigs. The valued rent in 1874 was £69,172 Scots, or £5764. The valuation for 1881—1882 was £672,256, exclusive of railways and public works, valued at £78,218. The parliamentary constituency, returning one member, in 1881—82 was 6593.

R. was the chief patrimony of the Stewards of Scotland, granted to them in 1404 by Robert III., since which time the eldest son of the reigning sovereign has borne the title of Baron of Renfrew.

RENFREW, an ancient royal, parliamentary, and municipal burgh, capital of the county of the same name, stands on the south bank of the Clyde, 6 miles west-north-west of Glasgow. It contains an educational institution called the Renfrew Grammar School and Blythiswood Testimonial, which was originally endowed by charter of Robert III., and is in part maintained by the Town Council. On the banks of the Clyde is a wharf, at which the Glasgow steamers touch. Silk and muslin fabrics are woven; and many of the inhabitants are employed in iron-works and in ship-building, which branches of industry have within recent years become important here. Pop. (1861) of royal burgh, 3412; (1871) 4163; (1881) 5115.

RE'NI, a town of Bessarabia, at the confluence of the Pruth and the Danube, on the left bank of both rivers. It carries on a considerable trade, exporting large quantities of Grain. Pop. about 8000.

RENNEL, JAMES, a well-known English geographer, was born near Chudleigh, Devonshire, in 1742, and entered the navy as a midshipman at the age of 15, distinguishing himself under Admiral Parker, at the siege of Pondicherry. At the age of 24, he left the navy, and enlisted as an officer of engineers in the East India Company's army, rising through the influence of his distinguished services under Clive to the grade of major. Soon afterwards, he was transferred to the post of surveyor-general of Bengal, an office more in keeping with his tastes. While serving in the army, he had prepared and published a *Chart of the Bank and Currents of Cape Agulhas* (1768), which attracted the general notice of geographers; and having retired from office (1782) with a pension of £600, he followed up this work by a succession of geographical works on India, the chief of which was *Memoirs of a Map of Hindustan* (Lond. 1788), new editions of which appeared in 1788, 1793, and 1800, each of which merits to be considered a distinct work. But his geographical investigations took a wider scope, for in 1792 he published a *Memoir of the Geography of Africa*, from the communications of Major Houghton, and the relations of Ledyard and Hornemann; and in 1798, he aided Mungo Park in the arrangement of his travels, illustrating them by a map. R. had been elected a member of the Royal Society in 1788.

The subject of the correctness of the ancient geographers being at that time much discussed, R., though wholly ignorant of Greek, undertook the vindication of Herodotus (whose works he became acquainted with through the medium of a translation), and published in 1800 his *Geographical History of Herodotus Examined and Explained*, a work of unrivalled merit, displaying as it does one of the grandest combinations of acuteness, sagacity, and research. A second edition was published in 1830. In 1814,

appeared his *Observations on the Topography of the Plan of Troy*; and two years afterwards, *Illustrations (chiefly Geographical) of the Younger Cyrus, &c., and of the Retreat of the Ten Thousand*. After his death, which took place at London, 29th March 1830, there were found among his papers several MS. works, including the *Investigation of the Atlantic Currents and those between the Atlantic and Indian Oceans* (Lond. 1832), in the composition of which book he examined the logs of all the ships of war and Indiamen which had traversed those seas for about 40 years previous and reduced their observations to a general system; and *A Treatise on the Comparative Geography of Western Asia*, with an atlas ancient and modern (Lond. 1831), a work of great labor and research, which had been prepared by the Royal command, and the publication of which was partially defrayed at the king's expense. R. was one of the most remarkable men of his time; his works exhibit throughout the most earnest perseverance and industry, sound judgment, and wonderful sagacity.

RENNES (*Redones* of the Romans, *Comdate* of the Gauls), formerly the capital of the province of Bretagne, now the chief town of the dep. of Ille-et-Vilaine, is situated at the confluence of the rivers Ille and Vilaine. It is divided into the upper or new town, and the lower or old town. It is surrounded by ancient walls, flanked with towers, beyond which lie extensive suburbs. Three bridges unite the two divisions of the town, the older portions of which lie on the left bank of the Vilaine, and are often exposed to serious damage from inundations. The most noteworthy of the public buildings are the modern cathedral, whose interior is a very spacious hall of Grecian architecture; the stately Palais de Justice; the Hôtel de Ville; and the Lycée. R. is the see of a bishop, and the seat of a High Court of Jurisdiction for Ille-et-Vilaine and several other adjacent departments, and has tribunals of First Instance and of Commerce. As the focus of main and branch-lines of railway between Paris and the north-west of the empire, and commanding good river and canal navigation, R. is favorably situated for commerce; and in addition to the transport of the abundant farm-produce of the neighboring districts, it carries on a considerable trade in its own manufactures, which include cotton and linen yarns, flannel stockings, lace, sail-cloths, earthenware, &c. R. was all but reduced to ashes by a great fire in 1720. Pop. (1876) 63,598.

RE'NNET consists of the inner lining of the true stomach (see DIGESTION) of the sucking-calf, and depends for its use upon the acid gastric juice contained in it. It is prepared by removing the stomach from the animal as soon as killed, and scraping off the outer skin and all superfluous fatty matter. The membrane is then salted for some hours, and stretched out to dry. If perfectly dried, it will keep for a long time. When used, a small piece is taken and soaked in a little whey or water, and then added to the milk intended to be curdled.

RENNETT, the common name, not only in English, but, with slight modifications, in French, German, and other languages, of a class of apples, including many of the most beautiful and pleasant varieties. They are of very regular and nearly globose shape; their skin has generally a rusty tinge, and often a kind of unctuousness to the touch; their flesh is finely granular; and besides being sweet and agreeably acid, they have a peculiar aromatic flavor. They do not keep well. The trees have a very regular habit of growth, and are very suitable for dwarf standards. The name R. seems to be originally French—*Reinette*, Little Queen.

RENNIE, JOHN, an eminent civil engineer, was born at Phantassie, near East Linton, East Lothian, 7th June 1761. His preliminary education was obtained at the parish-school of East Linton, and supplemented by two years at Dunbar, where he was indoctrinated into pure mathematics. After being for some time a workman in the employ of Mr. Andrew Meikle, celebrated in connection with the Thrashing-mill (q. v.), he proceeded to Edinburgh, where he attended the lectures on natural philosophy by Dr. Robison, and those on chemistry by Dr. Black (q. v.). Furnished with a recommendation from Professor Robison, he visited (1780) the works of Messrs Boulton and Watt at Soho, near Birmingham, and was immediately taken into employment by that eminent firm. Here his mechanical genius soon displayed itself; and so highly did Watt esteem R., that he gave him, in 1789, the sole direction of the construction and fitting-up of the machinery of the Albion Mills, London; and the ingenious improvements effected in the connecting wheel-work were so striking, that R. at once rose into general notice as an engineer of great promise.

Abundance of mill-work now flowed in upon him, and the thorough efficiency of his workmanship greatly contributed to his fame. To this branch of engineering he added, about 1799, another—the construction of bridges; and in this branch also his pre-eminent talent and ingenuity displayed themselves. The elegance and solidity of his constructions, the chief of which were raised at Kelso, Leeds, Musselburgh, Newton-Stewart, Boston, New Galloway (and at other places afterwards mentioned), were

universally admired; R.'s greatest work in this department was the Waterloo Bridge over the Thames, said to be the noblest structure of its kind in the world, and it certainly combines in the happiest proportions the qualities of grandeur and simplicity. It was commenced in 1811, and finished in less than six years, at a cost of more than £100,000,000. Another of his works is the Southwark Bridge, which was built on a new principle, cast-iron arches resting on stone piers, and was finished in four years at an expense of £800,000. He also drew up the plan for the London Bridge, which, however, was not commenced till after his death. We have only space to enumerate the rest of his great engineering achievements: he superintended the execution of the Grand Western Canal in Somerset, the Polbrook Canal in Cornwall, the canal joining the Don and Dee in Aberdeen, that between Arundel and Portsmouth, and chief of all, the Kennet and Avon Canal between Newbury and Bath. The London Docks, the East and West India Docks at Blackwall, with their goods' sheds, the Hull docks, the Prince's Dock at Liverpool, and those of Dublin, Greenock, and Leith, were all designed, and wholly or partially executed under his superintendence. He also planned many improvements on harbors and on the dockyards of Portsmouth, Chatham, Sheerness, and Plymouth; executing at the last-mentioned port the most remarkable of all his naval works, the celebrated Breakwater. R. died October 16, 1821, and was buried in St. Paul's Cathedral.

R.'s great merit as an engineer consisted in his almost intuitive perception of what was proper to be done to effect the assigned purpose. Another striking characteristic of his works is the remarkable combination in them of beauty and durability. In this respect, R. had no rival; and though his works are frequently objected to on the ground of their expensiveness, yet their lasting qualities will in the end more than compensate for this. In person, R. was of extraordinary stature and herculean strength—characteristics which have for a lengthened period distinguished his family, and with reference to which numerous tales are still current regarding many of his relatives.

RENNIE, GEORGE, an eminent English civil engineer, and the eldest son of the preceding, was born in Surrey, January 3, 1791; and at the age of 16 entered the Edinburgh University, being placed under the charge of Professor Playfair, in whose house Earl Russell, then an Edinburgh student, also at that time resided. After attending a course of classics, mathematics, chemistry, and natural philosophy, he returned to London in 1811, and commenced the practical study of engineering under his father. In 1818, he was appointed the superintendent of the machinery of the Mint, and at the same time aided his father in the planning and designing of several of his later works. After his father's death in 1821, R. entered into partnership with his younger brother, John (afterwards Sir John Rennie), as engineers and machinery constructors; and during the existence of the firm, it carried on an immense business, including the execution of most of the works which had been planned by the elder Rennie, and the completion of those which he had left unfinished.

Their operations included the construction of bridges, harbors, docks, ship-yard and dredging machinery, steam-factories, both in Great Britain and on the continent, and many of the great naval works at Sebastopol, Cronstadt, Odessa, Nicolaiev, and in the principal ports of England; they also made the coining machinery for the mints at Calcutta, Bombay, Lisbon, Mexico, and Peru; the biscuit, chocolate, and flour mills at Deptford, Gosport, and Plymouth; and furnished marine engines for the war-ships of England, Russia, France, Italy, Mexico, &c. Besides these multifarious labors, they built ships both of wood and iron, drained large tracts of land in the midland counties of England, and R. superintended the construction of several continental railways. He was elected a Fellow of the Royal Society in 1822, and was subsequently enrolled in similar societies at Dublin, Turin, Rotterdam, &c. He is the author of 'Experiments on the Strength of Materials,' 'The Frictions of Solids,' and 'The Frictions of Fluids,' published in the *Philosophical Transactions*. He also contributed Memoirs to the *Transactions of the Civil Engineers*. He died 30th March 1866.—His brother, SIR JOHN, was knighted on the occasion of the opening of the new London Bridge (1831), which he executed from his father's designs. He designed and executed Southwark and Waterloo Bridges; and completed the drainage of the Lincolnshire coast, begun by his father. He died 1874.

RENT, in Political Economy, is a term applied to the profits drawn from land, houses, or other immovable property, termed in England 'real property.' It is colloquially applied to these profits only when the property is hired by a tenant who pays for the use of it. It was long before a distinction was made between such letting and hiring and that of any other commodity, such as a ship or a wagon. But political economists found that there was a fundamental distinction, affecting large questions not only in political economy but in state politics. These are connected with

the specialty that other profits, whether from the letting of articles or otherwise, arise out of the acts of those to whom the articles belong; but the rent of land is a fund that exists through external causes, over which the owner has no control, and in certain conditions *must* exist whoever may draw it.

When 'the theory of rent,' as it was termed, dawned upon the economists, and was but partially seen, they developed it in different formulas, which appeared to be different theories, but in reality were crude forms, tending, though complicated in themselves, to the simple principle, that the pressure of population on the means of subsistence creates rent on those lands where the means of subsistence can most easily be produced. In an enlarging and aggrandizing country like Britain, the phenomenon is in constant gradual operation; but it will be best illustrated by supposing an instance of sudden and extensive action. Suppose there is an island in which 1000 people find enough for their wants in the natural produce of its most fertile soil. Suddenly 500 people become added to the population, and an increase of the existing food to the extent of one-half is required. The shape in which this increase will take place will be competition, by the offer of an enhanced price for food, and that enhanced price will tempt people to bring under cultivation the inferior lands. The owners, however, of the old rich lands will not see their neighbors getting prices a third higher than themselves; they, too, will sell their produce at the market price, and the difference between this and the old value will be *rent*. It is of no moment, in the economic question of the existence of the element, that the owner of the rich soil does not let it; if he eats his bread cheaper than his neighbor, that is merely the form in which he derives the advantage of *rent*. The importance of this view, both in politics and economics, is that *rent must exist, and cannot be got rid of*. Whoever has at his command better land than the worst that is cultivated, holds rent.

It is in vain, therefore, to think of destroying the 'monopoly,' as it is sometimes called, of land-owners; it revives as naturally by an economic law, as water finds its level by a physical law. If you were to divide all the land in Britain to-morrow in equal portions among the inhabitants, the value of it would be greatly deteriorated by the change, but in time some patches would become more valuable than others, and worth 'rent,' while the frugal and industrious would gradually be absorbing the portions of the idle and extravagant, and accumulating estates. In fact, to the mere consumer, it is of no moment who has the land, provided it is in the hands that can render it most productive. To this end, it is more profitable that the land of a country should be in the market, and obtainable by those who, being ready to give most for it, are able to work it to most profit. In France, where land is divided among the owner's descendants, the consequent breaking up into small patches, not necessarily in the hands of persons able or willing to cultivate them, is detrimental to the value of the land at large. On the other hand, an entail system, such as that which predominated, and still to a certain extent exists in Scotland, is detrimental, by keeping the land out of the market, and necessitating that it shall belong to a certain person, who has perhaps neither the ability nor the capital to turn it to its best purpose. In the struggle which terminated in the establishment of free trade in 1846, the 'theory of rent' was referred to with much alarm, and it was said that when grain was brought from abroad, a reversal of the action creating rent would occur, from the inferior lands falling out of cultivation. Some free-traders admitted this as a necessary evil, but others said that the expansion given to commerce would increase the demand for the produce of the soil, while the home-growers would have a monopoly from their vicinity. In fact, the increase of trade and riches has been so great, that the value of land has greatly increased since the establishment of free trade, and that although half our bread-stuffs come from abroad. The great increase has been in the rearing of butcher-meat, which the increased wealth of the people has enabled them to buy.

RENT, in English Law, is an incident to the tenure created between a lessor and lessee. It consists not necessarily of money, but may be a quantity of corn, or a peppercorn, or a flower. Where lands are held rent-free, it is usual for the landlord to reserve some nominal rent, merely as an acknowledgment of tenancy. In the ordinary case of leases, a payment of a fixed sum of money is reserved annually for the benefit of the landlord. It is incidental to rent that the landlord can, if it is not duly paid, distrain the tenant's goods, or, indeed, any person's goods found on the premises; i. e.; the landlord can seize these and sell them without any judicial authority, in order to pay the rent. No express agreement between landlord and tenant is necessary to give the landlord this power of distress. The rule is, that rent issues out of all and every part of the premises, and whatever goods are found on any part of the premises can be distrained by the landlord. Sometimes the owner of land gives a third party a right to a certain rent out of his lands, by way of security,

and it is called a rent-charge; the party entitled to the rent-charge having power to distrain also for the rent, though having no other right to the lands. In Scotland, though the general rules as to rent do not substantially differ, the landlord's power of sequestration is not identical with the English power of distress. See LANDLORD AND TENANT.

RE'NTON, a small town in the county of Dumbarton, and two miles north of the town of that name, on the right bank of the Leven. Smollett, the novelist and historian, was born in the neighborhood, and is commemorated by a monument in the town. Pop. (1871) 3087; (1881) 4319, who are employed in the printing, dyeing, and bleaching works on the Leven.

RENUNCIATION, as a legal term, is the renouncing or abandoning of a right. In England, the term is used solely in reference to an executor who has been nominated in a will, but who, having an option to accept it, declines to do so, and in order to avoid any liability, expressly renounces the office. This, he may do by letter addressed to the Court of Probate.—In Scotland, the term is also used in reference to an heir, who is entitled, if he pleases, to succeed to the ownership of heritable property, but, from the extent of the incumbrances, prefers to renounce the character of heir. So the renunciation of a lease in Scotland is used in the same sense as the surrender of a lease in England.

RENWICK, JAMES, LL.D., an American author and physicist, was born about 1785, and graduated at Columbia College, New York, in 1807. In 1820, he was appointed Professor of Chemistry and Physics in that college, a position he held until 1854. In 1838, he was appointed by the United States government one of the commissioners to explore the line of the boundary, then settled by the Ashburton treaty, between Maine and New Brunswick. In addition to his collegiate duties, he wrote the biographies of Robert Fulton, David Rittenhouse, and Count Rumford, in *Spark's American Biography: a Memoir of De Witt Clinton* (1834); *Treatise on the Steam-engine* (1840—1841). His text-books, *Outlines of Natural Philosophy* (1832), and *Outlines of Geology* (1838), were the first works of their kind published in the United States, and, with his other educational works, have passed through numerous editions. R. died in 1863.

REPAIRS is the legal as well as popular term to denote the repairs done to a house or tenement by a tenant or landlord during the currency of the lease. In England, the burden of repairs is at common law thrown on the tenant, so that unless the lease expressly say that the landlord is to do the repairs, the tenant will be bound, but generally the lease states who is to do the repairs; and it is only ordinary repairs that the tenant is bound to do. In the lease of farms, the tenant is bound only to keep the house in repair, and not the out-buildings, though he is bound to keep the fences in repair. If the landlord is bound to do the repairs, and fails to do them, the tenant is not entitled to quit the premises on that account, though he will be entitled to sue the landlord for damage caused by the want of repairs. In Scotland, the landlord is bound at common law to put the premises into tenable repair at the commencement of the lease. The tenant is then bound to keep them in ordinary repair, but not to keep them in repair where some hurricane or extraordinary cause has done injury.

REPEAT, in Music, a character indicating the repetition of the part or strain to which it applies. It consists of two perpendicular lines through the staff, with dots before them and between the lines of the staff placed at the close of the strain to be repeated. When a series or notes has to be repeated from the beginning of the piece, this sign is inserted at the place where we have to return to the beginning. But when the repetition is not from the beginning of the piece, a reversed repeat must be placed at the point where the repetition begins, the passage to be repeated being enclosed by the two signs. When the following strain is also to be repeated, we have the dots placed on both sides of the repeating sign. When a passage of some length is to be repeated, with an alteration at the end, a curved line with the figure 1, *1ma*, or *prima volta* (Ital. first time) is placed over the part which is to be altered, the sign of the repeat follows, and then the altered termination with 2, *2da* or *seconda volta* (Ital. second time) placed over it.

The words *Da Capo*, abbreviated D. C. (Ital. from the beginning), indicate that a piece is to be repeated from the beginning. But if that repetition is only to extend to a particular point, at which the movement or piece finally closes, that point is indicated by the word *Fine* (Ital. end), or the letter F. If, however, the repetition, is to begin, not from the commencement of the piece, but from another point the sign :S: is placed over the point, and the words *dol segno*, abbreviated D. S. (Ital. from the sign), are used to indicate the point after which the repetition is to begin.

REPETITION, in Scotch Law, means the repayment of money which had been received by mistake or ignorance. The form of action by which money is so recovered was, in the Roman law,

called *condictio indebiti*, and the law of Scotland adopts the same expression. The maxim is, that if money has been paid under some mistake as to the law, it cannot be recovered; but if it was paid under a mistake as to a matter of fact, then it may be recovered. In England, the same doctrine holds, and the action is called an action for money had and received.

REPLEADER, in English Law, is a right to plead again, or deliver a fresh pleading, in consequence of the issue which had been joined not meeting or exhausting the real point in dispute. This right is much abridged, in consequence of the liberality now used in amending the record.

REPLEVIN, in English Law, is a form of action by which goods which have been seized under an illegal distress are taken back (security being given to the amount for which the goods were distrained), and the action of replevin commenced, to try the legality of the seizure.

REPLICATION, in the English Common Law, means the pleading of the plaintiff in answer to the defendant's plea. The plaintiff's first pleading is the declaration, which is answered by the defendant's plea, and which in turn is answered by the plaintiff's replication.

REPORTING, PARLIAMENTARY. Accounts of single speeches, and, at times, of entire debates in the English parliament, have come down to us from a very early period, and in the voluminous work entitled the *Parliamentary History of England*, we possess the most valuable historical work in our language. The earlier volumes of the Journals of the House of Commons contain short notes of speeches, which the clerks made without the authority of the House; but all the later volumes record nothing but the votes and proceedings—the *res gestæ*, in fact. Sir Symonds d'Ewes, who may be considered our first parliamentary reporter, has left us a journal of Queen Elizabeth's parliaments. The session of 1621 was also reported from notes taken by a member. The Commons' Journals contain notes of speeches in the parliaments of James I. and James II.

Rushworth, assistant-clerk in the Long Parliament, 1640, took down in a species of short-hand any speech of importance, and furnished Charles I. with a copy of the king's own speech when he made the attempt to seize the five members. His account of *Remarkable Proceedings in Parliament* forms one of the most valuable portions of his *Historical Collections*. We are also indebted to Thurlow and Gray for notices of what occurred in parliament. During the reign of William III., a member now and then sent a copy of his speech to the newspapers, for printing which, however, they were sometimes called to account. In the reign of Queen Anne, a monthly pamphlet, called the *Political State*, gave an outline of the debates in parliament. In the reign of George I., the *Historical Register*, published annually, professed to give reports of parliamentary speeches. The *Gentleman's Magazine* began a monthly publication of the debates, the number for August 1785 containing a report of the debate in the House of Lords on the previous 23d January. Cave, the publisher continued the practice in succeeding numbers, and his systematic proceedings are thus described by Sir John Hawkins: 'Taking with him a friend or two, he found means to procure for them and himself admission into the gallery of the House of Commons, or to some concealed station in the other house, and there they privately took down notes of the several speeches, and the general tendency and substance of the arguments. Thus furnished, Cave and his associates would adjourn to a neighboring tavern, and compare and adjust their notes; by means whereof, and the help of their memories, they became enabled to fix at least the substance of what they had lately heard and remarked. The reducing this crude matter into form was the work of a future day and an abler hand—Guthrie, the historian, whom Cave retained for the purpose.'

There was, however, no publication of the debates during the sitting of the Houses; parliament was always prorogued before anything said in the course of the session was given in the magazine. At first, the names of the speakers were cautiously indicated by the first and last letter only, and in many cases the speaker's name was wholly omitted. Growing bolder by degrees, Cave printed the names at length. The House of Commons soon took the alarm. The publication of the debates of either House had been repeatedly declared to be a high breach of privilege. Sir Symonds d'Ewes gives us a resolution of the Lower House in the 31st Eliz. 1588, that 'speeches used in this House be not any of them made or used as table-talk, or any wise delivered in notes of writing to any persons whatever, not being members of this House.' In 1698, the Lords agreed to a standing order, which is still unrepealed, declaring 'that it is a breach of the privilege of this House for any person whatsoever to print, or publish in print, anything relating to the proceedings of the House, without the leave of this House.' The Commons followed up several previous resolutions to the same effect, by ordering, in 1728 'that it is an indignity to, and a breach of, the privilege of this House, for any person to presume to give, in written or printed news-

papers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers, or publishers of any such newspaper, this House will proceed against the offenders with the utmost severity.' In 1738, Speaker Onslow called the attention of the House to the breach of its standing orders by Cave and others.

Sir Thomas Winnington exhorted the Commons not to be less jealous of their privileges than the other House, which had lately punished some printers for publishing their protests. 'What will be the consequence,' he asked, 'if you allow these reports to go on unchecked? You will have the speeches of this House every day printed, even during your session, and we shall be looked upon as the most contemptible assembly on the face of the earth.' The result was another thundering resolution against the publication of debates 'either while parliament is sitting or during the recess, and a threat to proceed against offenders with the 'utmost severity.' The reports, notwithstanding, still appeared, but under the disguise of 'Debates in the Senate of Lilliput,' in the *Gentleman's Magazine*; and 'Debates in the Political Club,' in the *London Magazine*. The celebrated Dr. Johnson was employed by Cave in the composition of his parliamentary debates, and the reports from 1740 to 1743 are held to have been entirely prepared by him; sometimes with the assistance of the above-mentioned Guthrie, who had a good memory, and used to bring home as much as he could recollect from the House; and sometimes according to Boswell, with no other aid than the names of the orators and the side they took. When it was observed to Johnson that he dealt out reason and eloquence pretty equally to both parties, he remarked: 'I took care that the Whig dogs should not have the best of it.' It was not till 30 years later that the parliamentary debates descended from the magazines to the newspapers. The latter had, however, for some time resolved to report the debates (Woodfall's *Junius*, iii. 845), and they took advantage of the popular excitement arising out of the Luttrell-Wilkes election for Middlesex, to try the right of the House to interdict the publication of its proceedings.

The ever-memorable contest between parliament and the press began at the close of the year 1770. The House of Commons followed up another solemn threat by prompt action. Two printers, Thompson and Wheble, were ordered to attend at the bar, and, upon their contempt, were ordered into custody. On the 12th of March 1771, complaint was made against W. Woodfall, printer of the *Morning Chronicle*; J. Miller, of the *London Evening Post*; and four other printers of London daily papers, for printing the proceedings of the House. The debates were unusually violent; there were 23 divisions; and the House did not adjourn until four A.M. The printers were ordered to attend. Some surrendered, and on asking pardon on their knees at the bar, were discharged. Miller, not surrendering, was ordered into the custody of the serjeant-at-arms. His messenger arrested Miller within the precincts of the city of London, and was immediately given into custody by Miller for assault, and carried before the Lord Mayor, the Right Hon. Brass Crosby. The deputy serjeant-at-arms attended before the Lord Mayor, and explained the circumstances; but his lordship declared the Speaker's warrant illegal, discharged Miller from custody, and committed the messenger for assault. Wheble and Thompson had been carried respectively before Aldermen Wilkes and Oliver, who immediately discharged them, and bound them over to prosecute, and the Speaker's messenger to answer a charge of assault and false imprisonment. The House of Commons was furious. It had had enough of Wilkes, but ordered the attendance of the Lord Mayor (a member of the House) in his place, and also of Alderman Oliver.

The aldermen of London attended the House, and pleaded their own cause, alleging that their charters exempted the citizens from any law process being served upon them except by their own officers. The House ordered its various resolutions to be read, prohibiting the reporting of its proceedings by any, even its own members, and then committed Alderman Oliver to the Tower. The Lord Mayor, who was suffering from gout, was excused from further attendance that day, but Wilkes was ordered to attend at the bar on the 8th of April. The defiant alderman was ready for the fray, but the House evaded the meeting by adjourning from the 7th to the 9th. The Lord Mayor, on the 27th, was sent to join Alderman Oliver in the Tower. The city of London loudly protested against the arbitrary proceedings of the House, and the whole country responded to the appeal. The power of parliament to imprison ceases at the end of the current session, and on the day of prorogation, July 28, the Lord Mayor and Alderman Oliver marched out of the Tower in triumph, and at night the city was illuminated. A few days afterwards, the Speaker's messenger who had arrested Wheble was tried at Guildhall for the assault, found guilty, fined 1s., and imprisoned for two months in the Compter. Next session, the House of Commons tacitly acknowledged itself beaten.

The printers defied the House, continued to publish their pro-

ceedings, and slept, notwithstanding, secure in their beds. In a short time, the House of Lords also conceded the point. The victory was complete, and no attempt has since been made to restrain the publication of the debates and proceedings of parliament. The resolution affirming that it is a high indignity to, and 'notorious breach of, the privileges of the House to publish the debates,' still remains unreversed on the Journals. Although debates are now daily cited in parliament from printed reports, and galleries have been constructed for the accommodation of the reporters, yet for some years after the triumph of the press, the gallery of the Lower House was occasionally shut during debates. During the American war, the public were more than once excluded from the gallery for a whole session. It is still in the power of any member, who may call the Speaker's attention to the fact that 'strangers are present,' to exclude the public and the reporters from the House. This power has frequently been exercised during living memory, but on such occasions some one or more members who have dissented from this course have taken notes of the speeches, and have avowedly sent them to the newspapers.

The old machinery of newspaper reporting was susceptible of immense improvement. One of the Woodfalls (a brother of the Woodfall of Junius) had so retentive a memory that he went by the name of 'Memory Woodfall.' When editor of the *Morning Chronicle*, he used to listen to a debate in the gallery, and write it out next day, the taking of notes being at that time forbidden. The employment of only one reporter for the whole night necessarily caused great delay in the publication of the paper, Woodfall's journal sometimes not being ready until nine or ten o'clock at night. The first great improvement was made by Mr. Perry, a native of Aberdeen, who succeeded Woodfall in the management of the *Morning Chronicle*. He established a corps of parliamentary reporters to attend the debates of both Houses every night in succession. He thus brought out the night's debate on the following morning, anticipating his rivals by ten or twelve hours. The superior excellence of the reports thus obtained, as well as their more rapid publication, soon made the new system universal. The improvement in the reports of the debates from the period of the American war until the year 1815, was but gradual. At the close of the war, however, public attention being directed with almost exclusive anxiety to domestic affairs, the publication of parliamentary debates became an object of national importance, and in the course of a few years assumed its present full, detailed, and accurate character. Increased facilities for the discharge of their important and arduous duties were from time to time given to the reporters.

Formerly, they had no means of entering the Strangers' Gallery except those which were common to the public generally. On days when an interesting debate was expected, they were obliged to take their places on the stairs early in the forenoon, and, after standing there for many hours, to depend for their chance of getting in by battling their way in the crowd when the door opened. It happened one night during Mr. Pitt's premiership that the gallery was more than usually thronged in expectation of an important speech from the minister. The reporters, unable either by force or entreaty to obtain even tolerable accommodation, took counsel together. They left the House; and next morning, 'instead of the rounded periods of the minister, there appeared nothing but one dire blank, accompanied by a strong comment on the grievance in which it had originated.' Mr. Speaker Abbott, not, as it was believed, without concert with the vexed and aggrieved minister, immediately directed the appropriation of the uppermost bench of the gallery to the reporters' exclusive use, with a door in the center, by which they alone had a right to enter. Soon after, a small 'Reporters' Room' was added. The Lords followed the Lower House in providing accommodation for the press. During the debates on Catholic emancipation, a small space below the bar was raffled off for them, and a session or two afterwards, a seat was formally set apart for the reporters.

When the Houses of Parliament were destroyed by fire in 1834, an exclusive gallery was allotted to the reporters in both chambers of the temporary structure in which the legislature held its sittings. This arrangement has been continued in the splendid new Palace of Westminster, in which the two Houses now hold their deliberations. In the House of Lords, the Reporters' Gallery faces the throne and the woolsack, and is one of the most prominent internal features of the edifice. Complaint having been made of the inaudibility of the speakers, their lordships appointed a select committee, examined the reporters, the architect, &c., and took all possible measures to make themselves heard in the gallery. In the House of Commons, the Reporters' Gallery is behind the chair. Both Houses provide them with rooms and other conveniences for transcribing their notes. In the Lower House, one of the committee rooms has been set apart for their use; and a room occupying the site of the old Star Chamber has recently been given to them for a club-room.

The modern process of parliamentary reporting may be best

described by a sketch of the arrangements made by the *Times* newspaper for a due and expeditious transcript of the debates. The *Times* parliamentary corps is sixteen in number, who are equally divided between the two Houses. When one House rises, the entire corps is available for duty in the other, so long as it sits. It thus happens that one of a series of reporters is constantly in the gallery of the Lords, and another in the Commons. Like sentinels, they cannot leave their places until they are relieved by a colleague, but this relief takes place with unvarying regularity every quarter of an hour. When both Houses are sitting, each reporter has thus an hour and three-quarters for the work of transcribing his shorthand notes for the printer—a sufficiently short interval, when it is remembered that a moderate speaker will fill three-quarters of a column, and a rapid speaker not unfrequently a column, in a quarter of an hour. When his turn again comes round, each reporter must be ready to resume the duty of note-taking, and afterwards that of transcription for the press. By maintaining this quick succession of reporters, the process of writing for the press is never interrupted until the whole debate of the evening in both Houses is in the hands of the printer. A long speech may thus be said to extend from the mouth of the speaker to Printing House Square.

A part will be wet with ink on the reporters' table; one section will be traveling over the Thames Embankment in swift relays of cabs; a portion, becoming larger every few minutes, will be in the hands of the compositors, and a proof-sheet ready printed, of the earlier passages, will be on the desk of the editor. On some few occasions, when a minister has been more than usually anxious to secure the accurate publication of important statements, a proof impression of a verbatim report of nearly the whole of his speech has been placed in his hands, to his extreme astonishment, as soon as he resumed his seat. The mechanical arrangements of the printing-office are equally designed to secure expedition and accuracy. The parliamentary system of the other morning newspapers resembles that of the *Times*, but as the numerical strength of their corps does not approach that of the leading journal in any case, the periods of note-taking and 'relief' proportionately vary.

The system of parliamentary reporting underwent a change of great importance about 1847, when the electric telegraph was brought into general use by companies formed to work it. They proposed to supply papers out of London with London news, and a report of parliamentary debates was part of the news thus supplied. In order to get this report, the Telegraph Company obtained admission to the gallery for its reporters, and thus broke the monopoly which the London daily newspapers had up to that time enjoyed. Subsequently, when the electric telegraphs passed into the hands of the government, the parliamentary reports for newspapers out of London were provided by press agencies, and the accommodation in the Reporters' Gallery had to be increased for them. With the growth of provincial newspapers, the demand for more reports than the agencies supplied was felt, and the more powerful newspapers endeavored to secure special reports for themselves by the assistance of reporters who were engaged on the London press. In this way they were able to get and publish reports often much longer than those printed in London. This, however, was only done at great inconvenience, and an effort was made to obtain for leading provincial newspapers a right of admission to the Reporters' Gallery. These claims were considered by a special committee of the House of Commons, which in 1879 reported in favor of them; and next year the long coveted privilege was granted.

A few years ago, the object desired by newspaper proprietors was not a literal report, but what may be called the spirit of a speech—a faithful abridgment, in fact, of the sentiment, matter, and style of the speaker. Parliamentary reports subsequently became more diffuse, the debates of a single evening not unfrequently occupying between 20 and 30 columns of small type. This, however, has not been maintained, and though much might be said against the reporting at great length of important speeches, there can be nothing said in favor of such condensation of all speeches as prevails in most of the London newspapers—the *Times* and the *Standard* being exceptions. This excessive condensation greatly strengthened the claim of the provincial newspapers for admission to the Reporters' Gallery, for they were not only willing but desirous of furnishing to the public fuller and better reports of the debates than the London papers supplied.

It only remains to say a few words respecting *Hansard's Parliamentary Debates*, the only publication since the *Mirror of Parliament* which professes to give all the speeches fully and accurately. We have already pointed out (see HANSARD) that no staff of reporters is engaged for this work, and that when members quote *Hansard*, for the purpose of convicting an opponent of inconsistency, they are fully aware they are citing from the report of some daily journal; but they take it for granted the passage has been specially brought under the notice of the speaker by the

editor of that publication, and it is therefore presumed that the report is authentic.

In 1878 an arrangement was made between Mr. Hansard and the government, by which he undertook to supplement his reports by others taken by reporters in his employment who should have access to the gallery. This was not thought to be sufficient by some legislators, who desired an official report of the debates, that is to say, a verbatim report of all speeches. This was one of the questions submitted to the special committee to which reference has been made, and it indicated an opinion in favor of an arrangement by which Mr. Hansard's reports should be improved without being verbatim.

The constitutional importance of good and free parliamentary reporting can scarcely be overrated. It enables the entire people to be present, and in a manner to assist in the deliberations of parliament. The English orator addresses, indeed, not only the assembly of which he is a member, but, through it, the civilized world. Publicity has become one of the most important instruments of parliamentary government. Long before a measure can be adopted by the legislature, it has been approved or condemned by the public voice; and, living and acting in public, parliament under a free representation has become as sensitive to public opinion as a barometer to atmospheric pressure. See May's *Constitutional History of England*; Knight Hunt's *Fourth Estate*; Andrews' *History of British Journalism*; papers in *Chambers's Journal* in 1834; Grant's *The Newspaper Press* (1871); also article NEWSPAPER.

In continental countries enjoying constitutional government, official short-hand writers are usually appointed by the government to report the debates, and these reports may, under certain restrictions be transferred to the columns of the press. In the United States, particular speeches delivered in Congress are fully reported and generally read; but complaints are made by members that the New York and other journals do not give sufficient space to a report of the proceedings of Congress.

REPOUSSÉ, a French term applied to a peculiar method of ornamentation in metal-work, resembling embossing; but the effect is produced by hammering up the metal, which is generally thin, from the back, and when a rude resemblance of the figure to be produced is thus formed, it is worked up by pressing and chasing the front surface. The finest specimens of this art are of the *cinq-^{cento}* or 16th c. period, by Benvenuto Cellini. Cellini carried the art to France, where it has of late been much developed. Much common repoussé work is done in Birmingham, in the soft white metals, such as pewter and Britannia metal; and as these are easily worked, and can afterwards be electroplated, so as to hide the quality of the material, they are in considerable demand. After they are hammered up from the inside, they are filled with liquid pitch, and set by until it becomes solid. Then they are modelled and chased on the surface, the pitch forming a support, which prevents the tools from pressing down more than is required. The pitch is afterwards melted and drained out, and a subsequent boiling in an alkaline lye completely cleans the work. Tea and coffee pots are the chief articles made in this manner.

REPRESENTATION, in Politics, the function of the delegate of a constituency in a legislative or other public assembly. The principle of representation, even when not directly recognized, must be presumed to have existed to some extent in all governments not purely democratic, in so far as the sense of the whole nation was considered to be spoken by a part, and the decisions of a part to be binding on the whole. The constitution of ecclesiastical councils, in which an express or implied representation is necessarily involved, doubtless conducted to the application of a similar principle to national assemblies; but it is in the exigencies of feudalism that we trace the beginnings of an avowed and regulated system of political representation. The feudal superior who had to levy aid from his vassals, summoned a limited number of them to attend him, and confer regarding the required aid. The earliest complete system of representative institutions is to be found in the parliament of the Sicilies under the Swabian kings; but Britain is the only country in which a representative feudal assembly ripened into a legislative. As early as the reign of Henry III., we find the knights of the shire elected by the 'men of the country,' probably the king's military tenants, to consider, in the stead of each and all of them, what aid would be granted to the king for a proposed expedition into Gascony. Representatives of the burgesses were soon afterwards summoned, and were permanently ingrafted on parliament by Edward I. In Scotland, representative burgesses formed a part of the national assembly from the time of Robert Bruce's famous parliament at Cambuskenneth, in 1326; but down to a comparatively late period, the whole barons or freeholders of the country formed part of the king's council, and were entitled to attend in person.

A system of representation among them was attempted to be introduced by James I. on his return from England, but became practically inoperative; and it was not till 1587 that the represen-

catives of the small barons came to form part of the parliament. The progress of society has led to great changes in the constitution of the elective body, the most sweeping being those introduced by the Reform acts. See PARLIAMENT, and REFORM, PARLIAMENTARY.

An important question naturally arises connected with the subject of representation: Is the delegate the mere mouthpiece of his constituents, who must give effect to all their opinions and interests, or is it his duty to exercise his trust in the first instance for the general welfare of the nation? The former idea of representation was doubtless the earlier one; but it cannot be easily vindicated on any proper theory of government; and it is now the generally recognized doctrine among English statesmen, that a member of the House of Commons is bound to the entire nation by ties higher than those which bind him to his constituents, and that he ought to support such measures as he judges most beneficial to the country, even at the risk of prejudicing the immediate local interests of the body which sends him. It is therefore not very easy to reconcile with sound principles the usage which obtains so largely of demanding pledges from candidates for representation as to how they are to vote on every public question that is likely to come before them. Yet there is practically a difficulty in preventing a system of representation from becoming one of mere delegation, so long as the constitution gives to the electors the power of making their vote depend on any conditions which they may think fit to attach to it.

Most speculative politicians of the present day consider a representative government of some description as the best ideal type of government; but all repudiate the idea of an inborn right in all citizens to participate, and still more to participate equally, in the right of choosing the governing body. Any very extensive suffrage must of necessity lead to the predominance of mere numbers over intelligence, while a very limited suffrage has been objected to as doing away with the benefits which the community at large are presumed to draw from a participation in public functions. Several intelligent political writers, while advocating a widely extended suffrage, have proposed a graduation of that suffrage by giving to each individual a number of votes corresponding, as far as practicable, to his intelligence, property, and social position. This is doubtless the perfect ideal of representative government, and the chief question is, By what test can the best approximate estimate of social value be arrived at? Two different schemes for this purpose have been proposed by Mr. J. S. Mill and Professor Lorimer respectively—the former founded mainly on intelligence as indicated by instruction, and the latter on wealth and social position. The attention of political writers has also lately been directed to the question of the representation of minorities, who at present are not even allowed a hearing in representative assemblies. The most feasible scheme for this purpose is perhaps that of Mr. Hare, which had the approval of Mr. J. S. Mill, by which those who do not like the local candidates, are to be allowed to fill up voting papers by a selection from the names of any persons on the list of candidates, with whose general political principles they sympathize. This system, along with its other advantages, would, it is supposed, bring into parliament numerous men of able and independent thought, who, by the present system, refrain from offering themselves, as having no chance of being chosen by the majority of any existing constituency. See J. S. Mill, *Representative Government* (1861); Lorimer, *Political Progress not necessarily Democratic* (1857); Hare, *The Election of Representatives* (1860); Walpole, *The Electorate and the Legislature* (1882); Traill, *Central Government* (1882).

REPRIEVE (Fr. *repandre*, to take back) is the suspension of punishment for a crime, and is used chiefly in connection with capital crimes. The power of suspending all sentences at any time is vested in the crown at discretion. There are also several grounds on which the judge or a court reprieves a sentence. One is, where the judge is not satisfied with the verdict, or is doubtful of the validity of the indictment, in which case he reprieves the sentence, in order to give time for some application to the crown. Moreover, an ordinary ground of reprieve is acted on generally as a matter of course, whenever the prisoner is a pregnant woman, and pleads that fact, in which case it is considered only merciful towards the offspring to put off the execution of the sentence until after her delivery. This was the law of ancient Rome; and nothing connected with the memory of Queen Mary is more deplorable than the bloody proceeding in her reign of burning a pregnant woman in Guernsey, when the child, which was born at the stake, was cast into the fire as a young heretic. When a woman pleads her pregnancy as a reason for reprieve, the practice is for the judge to empanel a jury of 12 matrons, or discreet women, to inquire into the fact, and if they bring in a verdict of 'quick with child,' execution is stayed as a matter of course, from session to session until the delivery. Another cause of reprieve is the insanity of the prisoner, for if before execution it appear the prisoner is insane, whether the insanity supervened after the crime or not, the judge ought to reprieve him.

REPRI'SAL is the retaking, from an enemy, goods which he has seized, or the capture from him of other goods, as an equivalent for the damage he has wrought.—A *reprise* is a ship recaptured from an enemy or pirate. If recaptured within 24 hours of the hostile seizure, she must be wholly restored to her owners; if later, she becomes the lawful prize of her captors.

REPRISALS, LETTERS OF, the same as LETTERS OF MARQUE (q. v.).

REPRODU'CTION, or the propagation of organized beings in the animal kingdom, is accomplished by three different processes. The first of the three processes by which the multiplication of individuals takes place consists in the division of one organism into two, each of these, again, dividing into two others, and so on. This is termed *reproduction by fission*. The second mode of increase consists in the formation of a bud at some part of the body of the animal. This bud gradually approximates in form to that of the parent from which it springs; its pedicle or stem gradually disappears; and the liberated bud ultimately assumes a perfect form, resembling in all respects the parent from which it sprung (*gemmation*). The third mode is far the most complicated. In it the new organism results from a series of changes occurring in an impregnated egg or *ovum*. For this process, distinct sexual organs, both male and female (which, however, may be associated in the same individual, although in all the higher animals they occur in distinct individuals), are required; a female organ for the production of cells termed 'germs,' and a male organ for the production of certain cells termed 'spermatozoa.'

It is from the union (either within or without the body) and the mutual action of these cells—the germ and the spermatozoon—that the impregnated ovum results. The new resulting body is altogether different from either of the cells which took part in the production. This is the ordinary form of reproduction in all the higher animals and may be termed *true generation*, in contradistinction to the previous forms of *reproduction by multiplication*. The terms *Digenesis* and *Heterogenesis* have been applied by recent physiological writers to designate the form of reproduction in which the contact of germs and spermatozoa gives rise to fecundation; while the terms *Monogenesis* and *Homogenesis* have been similarly applied to the cases in which non-sexual reproduction takes place by fission or gemmation.

Pissiparous multiplication is best illustrated by a reference to the Infusoria. It may be either longitudinal, as commonly occurs in

Fig. 1.—Longitudinal Fission of Vorticella.

Vorticella; or transverse, as occurs in *Stentor*; or indifferently longitudinal or transverse, as in *Chilodon*, *Paramecium*, &c. The joints of tape-worms multiply in this manner, and when sufficiently developed, become free. Amongst some of the Annelids, or true worms, reproduction of this kind in a somewhat modified form is also observed. This was first noticed in a *Nais* by the

Fig. 2.—Myrtila, with six new individuals formed on it.

Danish naturalist Müller, by whom it was regarded as a rare and accidental occurrence. The more recent researches by De Quatrefages and Milne-Edwards, have, however, shown that the process is one of far more significance than Müller supposed.

In the genus *Syllis*, De Quatrefages noticed the following

appearances: When one of these worms is about to reproduce itself by fission, a number of rings become developed at its posterior extremity, and there is a notch or groove between the first of these rings and the part in front of it. The first ring soon becomes organized into a head provided with eyes and antennae. The two annelids, parent and offspring, continue, however, to be united by the skin and intestine in such a manner that the latter animal lives solely upon the food swallowed by the former. During this period, each possesses independent life, for a struggle may often be observed between the two, each wishing to go its own way. After the lapse of a certain time, the body of the offspring becomes distended with ova in some cases, and with spermatozoa in others, while neither of these structures is to be seen in the body of the primary animal. Complete division is at length effected, and the offspring is free. In a few days, however, their bodies burst, from the distention caused by their contents. Ova and spermatozoa are thus diffused through the water, and fecundation thus takes place. In the genus *Myrianida* (*Autolytus*, according to Grube's classification), Milne-Edwards has seen no less than six new individuals (instead of a single one, as in *Syllis*), formed in gradual succession, one before the other, between the two terminal segments of the original body. Each of these new individuals, as it arrived at maturity, and acquired the external form (in reduced dimensions) of the parents, was found to be possessed of reproductive organs, of which the original animal was totally devoid. The youngest and smallest individual is the most remote from the tail.

In these instances, multiplication by division occurs as a natural process, but there are many cases in which artificial division gives rise to multiplication. Bonnet having found that a certain kind of small worm, when cut in two, reproduced a tail at the cut extremity of the cephalic half, and formed a head upon the caudal half, increased the number of sections, and finally succeeded in dividing one worm into twenty-six parts, almost all of which acquired a head and tail, and thus became distinct individuals. Corresponding results may be obtained by dividing a planaria or actinia into many segments.

Reproduction by gemmation is a phenomenon of very frequent occurrence in the lower departments of the animal kingdom. In the lowest of the animal subkingdoms, the PROTOZOA, it occurs in the *Rhizopoda*—viz., in the *Foraminifera*; in the *Spongia*, being probably the most common form of reproduction in sponges; and in the *Infusoria*, as, for example, in *Vorticella*. In the COELENTERATA, it is of almost general occurrence in the classes *Hydrozoa* and *Actinozoa*; and in the MOLLUSCOIDS it occurs in *Polyzoa* and in *Tunicata*. In the accompanying figure (fig. 3), the process is shown as it occurs in the *Hydra fusca*, a freshwater hydra (the type of the *Hydrozoa*). If some hydras are kept for a few days in a glass of their native water, knot-like excrescences will be seen on their bodies. These are the buds or *gemmae*, which rapidly enlarge, and each by degrees assumes the appearance of a young hydra, tentacles appearing about the mouth, just as in the original animal.

For some time, a portion of the food (minute infusoria, entomostrea, &c.), caught and digested by the parent, passes into the body of the offspring; but when the tentacles are sufficiently developed, the young polype catches food for itself, and when it is sufficiently matured to commence an independent existence, the connecting pedicle gives way, and the young animal is free and independent, its posterior aperture of communication soon closing up.

It must be distinctly understood that the fact of an organism reproducing itself by fission or gemmation does not by any means exclude the possibility that it may also be reproduced by fecundated ova. That this is the case, is indeed shown in the instance of the worm *Myriana*. The *Hydra* too increases by ova, and it may be cut in pieces, each of which becomes a perfect animal. Other corroborative cases might be given.

In true generation, two special organs are required—a female organ for producing the germ cell or ovum, and a male organ for producing the sperm-cell or spermatozoon; and each form of generative apparatus consists of two parts, of which one is a formative organ—in the female, termed an *ovarium*, or ovary, and in the male, a *testis*—in which the reproductive cells are formed, and which is essential; and an efferent duct, by which the products of secretion are carried off. The male and female organs may exist in separate individuals, or they may co-exist in the same individual, giving rise to the condition known as *Hermaphroditism* (q. v.). The former condition is termed *bisexual* or *diacrius*, and the latter *unisexual* or *monacrius*. For a general description of the changes which take place in the impregnated egg, the reader is referred to the article DEVELOPMENT OF THE EMBRYO.

We shall conclude with a brief notice of the mode or modes of reproduction in the different classes of animals, beginning with the lowest.

In the subkingdom PROTOZOA, reproduction takes place usually by fission, occasionally by gemmation; but no satisfactory in-

stances of true sexual propagation by means of ova and spermatozoa are known, those cases described in certain *Infusoria* not having been confirmed by subsequent observers. It is worthy of notice, that in the *Infusoria*, propagation is effected in no less than three different ways—viz., by the two processes already described, and by a process known as 'encystation.' See INFUSORIA.

In the subkingdom COELENTERATA, it is found that both the *Hydrozoa* and the *Anthozoa* multiply by gemmation, by a true reproductive process, and in a few genera by fission.

In the ECHINODERMATA, fission has been observed in one class, the *Holothuroidea*, which, moreover, have distinct sexual organs combined in the same individual. In the other classes—the *Echinoidea*, *Asteroidea*, and *Crinoidea*—the sexes are separate, and generation only takes place by the union of germs or ova and spermatozoa.

In the ANNELIDA, true generation takes place, although as has been already shown, multiplication sometimes takes place by fission. In the lower *Mollusca* or *Molluscoids*, multiplication takes place by gemmation and by true generation; while in the higher *Mollusca*, multiplication only takes place by true generation.

In the ARTICULATA—Insects, Crustaceans, &c.—distinct generative organs are always present, and, excepting in one class of Crustaceans—the *Cirrhopoda*—the sexes are distinct.

In the VERTEBRATA, we meet with the highest and most complex development of the generative function. In them, with a doubtful exception in the case of one or two genera of fishes, the sexes are always distinct.

The osseous and cartilaginous fishes present important differences in their reproductive organs and in their modes of reproduction. In the osseous fishes, the essential female organ—the ovary, or roe—consists of a large membranous bag, usually in two lobes, but sometimes single. When distended with ova, this organ fills the greater part of the abdominal cavity, and its lining membrane is arranged in folds, wherein the ova are formed and retained until sufficiently ripe for expulsion. They then escape into the ovarian cavity, and are expelled in almost incredible numbers through a special opening immediately behind the anus and in front of the urinary canal. As a general rule, the ova of fishes are impregnated after their expulsion; and in order that the impregnation of a sufficient number of eggs may be secured, the male secretion of fishes—the fluid containing the spermatozoa—is very abundant; the male secreting gland, which in fishes is termed 'the milt,' or 'soft roe,' being equal in bulk to the ovary of the female. In a few instances, however, the young are hatched in the ovary, and grow to a considerable size before they are born, and in these cases—as, for example, in the viviparous blenny—impregnation must take place internally.

Fig. 3.—*Hydra fusca*, with a young bud at b, and more advanced bud at c.

Fig. 4.—The Egg of Cartilaginous Fish, opened so as to show the young animal.

In the cartilaginous fishes—as the sharks and rays—the generative organs are of a higher type. The eggs are here always impregnated within the body of the female, the male having special organs by which true sexual congress is effected, and the ovaries form two large racemose bunches, placed on either side of the spine. The eggs are large in size, and comparatively small in number; and as each egg escapes from the ovary, it is seized by a true oviduct, which furishes it with additional protective coverings. About the middle of this tube 'there is a thick glandular mass, destined to secrete a horny shell, in which the yolk and white of the egg become incased. The egg, when completed, has somewhat the shape of a pillow-case, with the four corners lengthened out into long tendril-like cords, whereby the egg is entangled amongst the seaweed at the bottom of the ocean. A

brittle egg-shell would soon be destroyed by the beating of the waves; hence the necessity for the corneous nature of the envelope; and yet how is the feeble embryo to escape from such a tough and leather-like cradle? This has likewise been provided for. The egg remains permanently open at one extremity; the slightest pressure from within, therefore, separates the valvular lips of the opening, and no sooner has the little shark thus extricated itself from its confinement, than the two sides close so accurately, that the fissure is imperceptible.

In the *Amphibia* or *Batrachia*, the sexes are more closely associated than in the osseous fishes, the ova being generally impregnated as they escape from the oviduct. The mode of reproduction of some amphibians is remarkable and anomalous. See PIPA.

In the true *Reptiles*, the male sexual organs become more perfect, instruments being given to facilitate the impregnation of the female.

In *Birds*, the generative organs present a close analogy to those of the higher reptiles. There is only a single ovary (the left) that has a bunch-like or racemous appearance; the right, with its oviduct, being always atrophied or rudimentary—a remarkable violation of symmetry, resembling that which occurs in the lungs of serpents. As prolonged utero-gestation would be incompatible with flight, incubation here attains its highest perfection.

In *Mammals*, a new organ for the first time appears, from which that important class derives its name. In most of them (see *MAMMALIA* and *PLACENTA*), a temporary organ, termed the Placenta, is also formed, by which the fetus is nourished during uterine existence.

Huxley's *Comp. Anat. of Invertebrated Animals*, p. 27; and Bal-four's *Comparative Embryology*.

REPRODUCTION IN PLANTS. See *PLANT, VEGETABLE PHYSIOLOGY, and FEUNDATION*.

REPTILES (Lat. *repto*, I creep), a class of Vertebrates distinguished from Amphibians (q. v.) by never possessing gills, but by breathing by lungs throughout life, by the usual presence of an exoskeleton, by the possession of only one occipital condyle, and numerous other characters—chiefly osteological. They agree in structure much more closely with birds, which Huxley has shown to present only a modification of the reptilian type, and with which he has accordingly united them into the group *Sauropsida*. They are distinguished from birds chiefly by the exoskeleton taking the form of scales or scutes, but never of feathers, by the fore-limb possessing more than three digits, by the slight development of the pelvis, the separateness of the metatarsal bones, and the cold blood. They are divided into nine orders, of which the first four only exist at the present day, and the remaining five are extinct: 1. *Lacertilia* (lizards, chameleons, blind-worms, &c.); 2. *Crocodylia* (alligators, crocodiles, gavials); 3. *Ophidia* (snakes); 4. *Chelonida* (tortoises and turtles); 5. *Ichthyosauria* ('fish-dragons'); 6. *Plesiosauria* (the so-called 'swan-dragons'); 7. *Dicynodontia* (with walrus-like teeth); 8. *Pterosauria*, or pterodactyls (the so-called 'flying dragons'); and 9. *Ornithoselida*, or bird-like reptiles (iguanodon, &c.), which were almost perfectly intermediate between the ordinary reptiles and the birds.

With the exception of the tortoises, the reptiles in general are of an elongated form, the body being often nearly cylindrical, and usually terminating in a very long tail. In a considerable number (as the serpents and some of the lizards) no traces of limbs are apparent; in some (as certain lizards), the limbs are rudimentary; while in the remainder the limbs are fully developed, although not to the extent to which development takes place in birds or quadrupeds, as the feet rarely suffice to keep the belly from the ground. The outer covering of the body presents several well-marked varieties. In a few of the lizards, the skin is covered with regular scales, composed of a mixture of bony and horny matter, and lying over each other like those of fishes; in most lizards and in serpents, there are scales and plates developed on the surface of the corium or true skin, and covered over with epidermis, which is thrown off at intervals, the moult forming an accurate cast of the body of the animal; while in the crocodiles and tortoises the scales are converted into true bony plates, which in the former are embedded in the tissue of the skin, and in the latter are united with the ribs, sternum, &c., of the internal skeleton, to form the complete bony case into which the head and limbs of the animal can be retracted.

The skeleton is completely ossified in all reptiles, and presents many points of interest to the philosophical anatomist, into which we have not space to enter. In the skeleton of the crocodiles and lizards, there is an obvious distinction of the regions of the neck, trunk, and tail. The total number of vertebrae is often great, but it is chiefly in the caudal region that the excess occurs; there being 36 caudal vertebrae in the crocodile, and 115 in the monster lizard. In the serpents, the vertebral column is more abundantly subdivided than in any other animal; the number of vertebrae in the python being 422, of which about six-sevenths

possess ribs articulated to their bodies by a ball-and-socket joint. By the motion which is thus allowed to the ribs, they become in some degree instruments of progression. In the reptiles gener-

Fig. 1.—Anatomy of a Serpent:

t, tongue and glottis; *es*, esophagus (partly removed, to show heart, &c.); *tr*, trachea; *ca*, *ca*, carotid arteries; *a*, left auricle; *c*, right auricle; *vt*, ventricle of heart; *vc*, vena cava inferior; *p*, *p*, principal lung; *p'*, rudimentary lung; *s*, stomach; *int*, intestines; *cl*, cloaca; *an*, anus; *o*, ovary; *o'*, ova.

ally (excepting the tortoises), one surface of each centrum (or body) of the vertebrae is concave and the other convex; while in the tortoises these surfaces are flat. The true skull is small, the bulk of the head being made up by the jawbones. As the sutures

Fig. 2.—Anatomy of Lizard:

a, *a'*, arches of the aorta; *r*, right auricle; *l*, left auricle; *v*, ventricle; *vas*, vena cava superior; *vas'*, vena cava inferior; *va*, ventral aorta; *pv*, pulmonary veins; *pa*, pulmonary arteries; *lu*, lung; *li*, liver and hepatic vein; *k*, kidneys and renal vessels; *vp*, vena portae; *s*, stomach; *int*, intestines; *an*, anus.

separating the individual bones never become obliterated, the reptilian skull is well adapted to illustrate the true structure of the vertebral skeleton.

In fig. 3, we have the skull of the crocodile; in fig. 4, that of a serpent; and in both, the corresponding bones are indicated by the same references. 1 is the *principal frontal*, divided in the serpent into two parts; 2, 2 are the *anterior*, and 4, 4 the *posterior frontals*; 7 is the *parietal bone*, which is usually single in reptiles;

12, 12 are the *mastoid bones* (homologous to the mastoid process in man); 17, 17 are the *intermaxillaries*; 18, 18 are the *maxillaries*; 20, 20 are the *nasals*; 23 is the *temporal bone* (corresponding to the squamous portion of the human bone); 34, 35, 36, 37 are the *den-*

Fig. 3.—Skull of Crocodile.

tal, the *articular*, the *angular*, and the *opercular* portions of the *inferior maxilla*, or lower jaw; *a* is the *tympanic bone*, which supports the drum of the ear; *b* is the *zygomatic or malar bone*; and *c, c* the *lachrymals*. The lower jaw (except in the tortoises) presents the peculiarity of being composed of a number of separate pieces; there being four or five in each half jaw in serpents, while in crocodiles and lizards each half is divided into at least five, and generally six pieces, which are united by suture. The four most important of these are shown in fig. 3. The purpose of this

Fig. 4.—Skull of Serpent.

arrangement are probably (as Dr. Buckland suggested in his *Bridgewater Treatise*) to diminish the risk of fracture, which would otherwise attend the snapping together of their elongated jaws.

The bones of the extremities, except in the serpents, which have no limbs, correspond with those occurring in the higher vertebrata.

The mouth, except in the Chelonians, is usually provided with conical teeth, adapted rather for seizing and holding prey, than for dividing and masticating food. These teeth, like those of fishes, are successional; that is to say, new teeth are being constantly developed, whilst the older ones are regularly shed. In the crocodiles, three, or even four generations of teeth, sheathed one within the other, may often be seen in the same socket. In some instances, the teeth are attached solely to the jaws, while in others they are also attached to the pterygoid or palate bones. In Chelonians, the teeth are replaced by a horny beak, which, according to the habits of the animal, is adapted for bruising as well as cutting, and which in some species constitutes a somewhat formidable weapon.

The digestive organs present less marked differences than the osseous system. With the exception of certain Chelonians, all reptiles are carnivorous, and swallow their prey whole. Hence the jaws are adapted, by their mobility and subdivision into segments, to open very widely, and the œsophagus is capable of great dilatation. The tongue is commonly free, elongated, and bifid, except in the crocodiles, in which it is immovable; whence the popular idea that these animals do not possess this organ. The stomach is sometimes scarcely larger than the œsophagus and intestines (as in serpents), while in other cases it forms a sac of considerable size. In either case, it is capable of great dilatation. A liver, pancreas, and spleen are always present, the two former glands pouring their secretions into the upper part of the intestine, which is short, wide, and not much twisted, and divided into two portions, corresponding to the small and large intestines of mammals, by a valve. It finally terminates in a wide cloaca, into which the ducts of the urinary and generative organs usually open. The anal aperture of this cloaca is *transverse* in serpents and lizards, and *longitudinal* in crocodiles and tortoises. These peculiarities in the anal aperture are accompanied by remarkable differences in the external generative organs of the male, and seem to divide the class into two great sections.

It is in their circulating and respiratory organs that reptiles present the most marked characteristics. Like birds and mammals, they breathe air, but like fishes, they are cold-blooded. The reason why they are unable to sustain a fixed temperature above and independent of that of the surrounding medium, is due partly to the arrangement of blood-vessels (see *CIRCULATION*), and partly to the structure of the lungs. The lungs are usually

of large size; but as they are not subdivided, as in mammals and birds, into innumerable microscopic air-cells, the real aërating surface is comparatively small. In several orders, they are merely capacious bags, whose vascular or aërating surface is but slightly increased by sacculi developed in their cells. In serpents, the pulmonary arrangement is singular, one lung (usually the right one) being of extraordinary length, while the other remains altogether rudimentary. It is in the tortoises and crocodiles that the lung is most highly developed; but if the reader will compare the accompanying figure of the lung of the turtle with a section of any mammalian lung, he will at once perceive the striking difference. This inferiority of the respiratory apparatus of reptiles is further shown in the absence of those means for the continuous introduction and expulsion of air which are observed in birds, and still more in mammals, and which are described in the article *RESPIRATION*.

The cerebral portion of the *nervous system* in many respects resembles that of fishes, but the cerebral hemispheres are larger in proportion to the optic lobes, while the cerebellum is usually smaller. The organs of the senses are better developed than in fishes. The eye is always present in reptiles, and presents no remarkable peculiarity. We here first meet with a special arrangement for the protection of this delicate organ; 'for while in serpents the skin of the head passes continuously in front of the

Fig. 5.—Section of the Lung of the Turtle (reduced).

Fig. 6.—Brain of Turtle:
A, olfactory ganglia; B, cerebral hemispheres; C, optic ganglia; D, cerebellum.

eyes, merely becoming transparent where it covers the cornea, it is doubled in most other reptiles into two folds, constituting the upper and lower eyelids, which can be drawn together by a sphincter muscle; and we also find a rudiment of a third eyelid, formed by an additional fold of membrane at the inner angle, which is so completely developed in crocodiles as to form a nictitating membrane, that can be drawn completely across the eye as in birds, by a muscle specially adapted for that purpose.—Carpenter's *General and Comparative Physiology*, 3d ed. p. 495. The organ of hearing is more highly developed than in fishes or amphibia. There is no external auditory canal, the membrane of the tympanum being covered externally by the integument of the head. The senses of taste and touch are probably obtuse in most animals of this class, and from its structure, the tongue is probably rather an organ of touch than of true taste.

All reptiles are *oviparous* animals. Certain species, however, retain their ova in a sort of uterine cavity, formed by a dilatation of the oviduct near its termination in the cloaca, until the development of the embryo is so far advanced that the enveloping membrane bursts previously to the expulsion of the ovum, so that the young are actually born alive—a mode of generation to which the term *ovo-viviparous* is applied. The eggs are relatively large, and are furnished with a very large yolk, for the nutrition of the young animal. They are enclosed in a parchment-like shell, which contains very little calcareous matter. They are usually deposited in warm sandy places, well exposed to the sun, or in dung-hills, in which the heat induced by the putrefactive process facilitates the final stage of embryonic development. Lizards lay from 8 to 12 eggs, serpents from 10 to 50, tortoises from 20 to 26, and crocodiles from 20 to 60. In this respect they differ widely from the amphibia, some of which lay as many as 1200 eggs. The common opinion that, after the expulsion of the eggs, the reptiles take no further care of their progeny, is erroneous. Crocodiles and lizards have been observed to watch the places which they have chosen as their nest; and the pythons (at all events, when in captivity) coil themselves around their eggs, and keep up a temperature very considerably above that of the

surrounding medium. The sexes are always separate; and the male generative organs, which are far more highly developed than in amphibians, present peculiarities which, in association with the position of the anal aperture, have been adopted by zoologists as a basis of classification.

In relation to their *habitat*, it may be observed that most of the tortoises and certain serpents are essentially aquatic animals (some inhabiting fresh, and some salt water), which rarely seek the land except for the purpose of laying their eggs. Serpents, however, as a general rule, affect moist places in the neighborhood of water, although some are inhabitants of dry sandy deserts. Lizards for the most part frequent the sandy districts of hot and tropical regions, and either burrow in the ground or live in holes in trees, walls, &c. Reptiles generally predominate in the warmer regions of the globe, in which alone the largest kinds are to be found. In the northern countries, comparatively few species are found, and these pass a great portion of the year in a state of Hibernation (q. v.) or torpidity. Dr. Carpenter puts down 2000 as about the probable number of existing species of reptiles. Schinz states that in Europe there are 7 tortoises, 33 serpents, and 35 lizards. See Dumeril and Bibron, *Herpétologie Générale, ou Hist. Nat. Complète des Reptiles* (Paris, 1834—1854, 9 vols.); also (see summary) Huxley, *Anatomy of Vertebrated Animals* (London, 1871.)

REPU'BLIC (Lat. *res publica*, the public good), a political community in which the sovereign power is lodged, not in a hereditary chief, but either in certain privileged members of the community, or in the whole community. According to the constitution of the governing body, a republic may therefore vary from the most exclusive oligarchy to a pure democracy. The several republics of Greece, and that of Rome were, at the outset at least, aristocratic communities. The medieval republics of Venice, Genoa, and the other Italian towns were also more or less aristocratic.

The sovereign power was held to be vested in the franchised citizens, and every function—legislative, executive, or judicial—not exercised directly by that body, could only be exercised by parties deriving their authority from it. But the extent of the franchise, and the mode of exercising it, varied much in these civic communities; and the most prosperous and long-lived was Venice, which was also the most aristocratic of them all. In the 16th c., the Seven Provinces of the Netherlands, on their revolt from Spain, adopted a republican form of government, as did Switzerland on becoming independent of the German empire. Great Britain was nominally a republic for eleven years (from 1649 to 1660). France was a republic from 1793 to 1805, and from 1848 to 1853; and the republic was again proclaimed 4th Sept. 1870. Such government as Spain had between Feb. 1873 and Dec. 31, 1871, was of a republican form. Switzerland is also a republic; since 1848 more democratic than formerly. The other republics of Europe are the diminutive states of San Marino and Andorra; and, in certain respects, the free cities of Hamburg, Bremen, and Kübeck. The most important of modern republics is that of the United States of America—dating from its separation from Great Britain—where pure democracy has been tried on a scale unknown elsewhere. Except during the short-lived empire from 1863—1867, Mexico has been a republic since 1824.

Nine republics at present exist in South America—Peru, Chili, Paraguay, Bolivia, Colombia or New Granada, Venezuela, Ecuador, Uruguay, and the Argentine Confederation. In the republics of the ancient world, the franchised classes exercised their power directly without any system of delegation or representation. The same was at first the case in the Swiss cantons, where, however, representative government has been gradually introduced. Modern republics have been founded on the representative, not the direct system, which can hardly exist except in a community that is very small and concentrated as to space. Switzerland and the United States of America are *federal* republics, consisting of a number of states bound together by a treaty, so as to present to the external world the appearance of one state with a central government, which has the power of enacting laws and issuing orders which are directly binding on the individual citizens.

REPU'BLCAN, a party name in American politics, which has had at different times different significations. At the adoption of the Federal Constitution in 1787, and while its ratification by the several states was under discussion, the country was divided into two parties—the Federalists, headed by Washington and the elder Adams; and the Anti-federalists (who afterwards took the name of Republicans), under the lead of Jefferson and Madison. The Federalists were in favor of a strong centralized government; the Republicans advocated the sovereignty of the States and the rights of the people; and finally secured those amendments and additions to the Constitution which were intended to guarantee state rights, and which declared that all powers not expressly granted to Congress by the Constitution, are retained by the States or the people.

During the French Revolution and the wars which succeeded it, the Federal party sympathized with England, while the Republicans favored the French; and being in power, under the presidency of Mr. Madison, declared war against England in 1812, a measure which the Federalists violently opposed, going so far in the Hartford Convention as to threaten a dissolution of the union. During the political excitement of this period, when the excesses of the French revolution had thrown a certain degree of odium upon its supporters, the Republicans were stigmatized by their opponents as Democrats. The name, given as a reproach, was soon adopted; and the party of Jefferson and Jackson called itself Democratic Republican, and its members were usually called Democrats; while the name of Federalist having become unpopular by the opposition of the party to the war with England, it adopted the designation of National Republicans, and some years later, of Whigs, which was the name taken by the 'disloyal' party in the War of Independence, the 'loyal' party being called Tories. The Whigs of 1840 repudiated alike the principles and name of the Federalists; they professed to be followers of Jefferson, and called themselves Democratic Whigs.

In the effort to elect Mr. Fremont in 1856, and in the election of Mr. Lincoln in 1860, the Whig party, deserted by many of its more conservative members, known as Old Whigs, but reinforced by a larger number of Free-soil Democrats and Abolitionists, adopted the name of Republicans, and were called by their opponents Black Republicans, from their anti-slavery tendencies. In the presidential contest of 1864, the Republicans, hoping to secure the support of the War or Union Democrats, adopted the name of the 'Union Party,' while they went further than the ancient Federalists in support of a strong centralized government. The Federalist, National Republican, Whig, and Republican party, has been essentially the same, and for the most part a New England or Northern party—its principal leaders having been John Adams, Josiah Quincy, Alex. Hamilton, Daniel Webster, Henry Clay, Wm. H. Seward, Abraham Lincoln, and Ulysses Grant. The Democratic party has its centers in Virginia and New York, and was the party of Jefferson, Madison, Jackson, Calhoun, Van Buren, Polk, Pierce, Buchanan. The former party advocated a construction of the Constitution favorable to the powers of the Federal government, a national bank, and a high protective tariff; the Democratic party, on the other hand, held to a strict construction of the Constitution, a careful limitation of the powers of the central government, an independent treasury, a specie currency, and free-trade, or a tariff for revenue only. There was, 30 years ago, a respectable Whig minority in most of the Southern States, and in two or three, Whig majorities; but when the Whig party adopted abolition, and took the name Republican, every southern state voted with the Democratic party.

Since the civil war, the people of the Southern States have been still more closely attached to the Democrats.—Other party names met with in American political writings are of a local, factional, or temporary character. 'Blue-light Federalist' was a name given to those who were believed to have made friendly signals to British ships in the war of 1812. 'Barnburner' was applied as a term of reproach to a section of the democracy supposed to be in sympathy with the 'Anti-renters.' The 'Soft Shells' were 'Free-soil' Democrats, in favor of excluding slavery from the territories and future states of the Union; while the 'Hard Shells' were in favor of what they held to be the rights of the South. The more widely known name of 'Locofoco,' applied to, and good-naturedly accepted by the Democratic party, arose from the fact, that a meeting of a section of the party in Tammany Hall, its New York headquarters, having been deprived of light by the turning off of the gas, at the order of the party managers, lighted up the hall with candles, by the aid of lucifer or loco-foco matches, and so passed its resolutions. 'Copperhead,' the name of a venomous serpent, was applied to the peace party by the advocates of the war for the Union.

REPU'LSION, like Caloric, Luminous Corpuscles, and other crude hypotheses of medieval times appears to be doomed to speedy extinction. The apparent repulsion between the particles of a gas, in virtue of which it exerts pressure on the containing vessel, is now known to be due to motion (see HEAT). A wet cork and an oiled one, floating on water, repel each other—a phenomenon fully accounted for by capillary attraction; as is that of the apparent repulsion of mercury by glass, which is shown to be due to the fact, that mercury attracts itself more than it attracts glass. No one now believes that a balloon rises while a stone falls, because the former is repelled, and the latter attracted, by the earth. The last is a very good example, because it clearly shows how apparent repulsion may be the result of attraction. The earth attracts the balloon less than it attracts an equal bulk of the medium (air) in which it floats; and, consequently, the pressure of the air on the balloon is more than sufficient to support its weight. The moon raises tides not only on the side of the earth nearest her, but also on that furthest from

her. No one imagines that she attracts the nearer water, and repels the further. We know that she attracts the nearer water more, and the further less, than she attracts the earth; and that the apparent repulsion is thus merely a difference of attractions.

It is not quite so clear how we are to account generally for repulsion in Electricity (q. v.), Magnetism (q. v.), and Electro-magnetism (q. v.), though many of these phenomena are known (especially by the beautiful experimental researches of Faraday) to bear explanations precisely analogous to that of the balloon above alluded to. There are also very curious problems, apparently involving repulsion, connected with the behavior of the tails of comets. But it is reasonable to suppose that, in all probability, we shall soon be able to account for all these phenomena by simple differences of attraction on the body influenced and the medium which surrounds it. Our real difficulty will thus be reduced to the explanation of attraction itself, which promises to be a problem of a far higher order of complexity. For an account of some of the modern speculations on this subject, see FORCE.

REPUTE, in Scotch Law, is used sometimes as a technical term, which it is not in English law. Thus, a habit and repute thief is one who, as a matter of fact, is notoriously a thief. So habit and repute marriage is a marriage constituted between parties who have notoriously lived as man and wife, and are supposed by neighbors and friends to be married, though there never was a regular marriage.

REPUTED OWNERSHIP is a phrase used in the English Bankruptcy Law to denote that the bankrupt at the time of his bankruptcy was apparently the owner of goods in his possession. The general rule is, that whatever belonged to the bankrupt at that date goes to his assignees in bankruptcy, for the purpose of sale, and distribution of the proceeds among his creditors. But as a trader often has the goods of others in his possession with their consent, and thus has the appearance of a greater capital or stock than he possesses, and thereby obtains greater credit than he would otherwise do, it is provided by the Bankrupt Act that if the bankrupt at the date of his bankruptcy shall, with the consent of the true owner, have in his possession, order, or disposition any goods or chattels whereof he was the reputed owner, or whereof he had taken upon him the sale, alteration, or disposition as owner, the Bankruptcy Court shall have power to order the same to be sold and disposed of for the benefit of the creditors under the bankruptcy. The object of this is to prevent deceit by a trader from the apparent possession of property to which he is not entitled; as it makes the real owners of goods who intrust them to a trader, careful, that they run the risk of the goods being seized for the general benefit of the creditors. Where, however, the articles in possession of the bankrupt are of that peculiar description that they are naturally calculated to excite an inquiry on the part of creditors as to whose they are, it is otherwise. Thus, pictures deposited with a bankrupt to take charge of, as they do not lead to any erroneous belief on the part of persons dealing with him, so they do not fall to be sold and divided as part of his assets. A similar doctrine exists in Scotland by the common law, and is therefore applied to other cases than bankruptcy. By the Mercantile Amendment Act, 19 and 20 Vict. c. 60, s. 1, in order to assimilate the law to that of England, it was declared that goods sold, but not delivered, shall not be attachable by the creditors of the seller, to the effect of preventing the purchaser or others from enforcing delivery of the same, and the right of the purchaser to demand delivery of such goods from and after the date of the sale, shall be attachable by the creditors of the purchaser.

REQUEÑA, a town of Spain, in the modern province of Cuenca, and about 80 miles south-east of the town of that name. It contains an industrious population, amounting to 10,500, who are employed in the manufacture of woollen, cotton, and silk fabrics.

REQUESTS, COURT OF, an ancient court of equity in England, inferior to the Court of Chancery, and presided over by the Lord Privy Seal. It was abolished by 16 and 17 Char. I. c. 10. Also, a local tribunal (known likewise by the name of Court of Conscience) instituted in London by Henry VIII. for the recovery of small debts, with jurisdiction between citizens and freemen in questions of debt or damage under 40s., afterwards extended to questions under £5. Similar local tribunals were instituted by act of parliament in other parts of the kingdom; but they have all been superseded by the county courts.

REQUIEM (Lat. *requies*, rest), a dirge or solemn service for the dead in the Roman Catholic Church. It consists in the celebration of the mass *Pro Fidelibus Defunctis* (For the Faithful Departed), the first words of the Introit of which are *Requiem æternam*.

RE'REDOS (Fr., behind the back), the wall at the back of an altar, seat, large fireplace, &c. In churches, the reredos is usually in the form of a screen detached from the east wall, and is invariably

ornamented with niches, statues, &c., or with paintings or tapestry. Very fine examples exist at Durham, St. Albans, &c.

RESCRIPTS (Lat. *rescripta*), answers of the popes and emperors to questions in jurisprudence officially propounded to them. *Rescripta principis* were one of the authoritative sources of the civil law, and consisted of the answers of the emperor to those who consulted him, either as public functionaries or as individuals, on questions of law. They were often applied for by private persons, more especially women and soldiers, to solve their doubts or grant them privileges. The rescripts directed to corporate and municipal bodies were known as *Pragmatica sanctiones*, a name which has found its way into the public law of Europe. See PRAGMATIC SANCTION. Rescripts might gradually come to have the force of law, in so far as their determinations in particular cases were of general application.

RESCUE, in English Law, is the illegal delivery and discharge of a prisoner or of goods out of the custody of the law. If, for example, a tenant whose goods are distrained for rent, take them by force from the bailiff, the distrainer has a right of action against the tenant or person who rescues the goods. When a prisoner is in custody for felony, and is rescued, the rescuer commits a felony. So the rescue of a prisoner for debt is an indictable offence, punishable by imprisonment for life, and forfeiture of lands and goods.

RESECTION or EXCISION OF JOINTS is an operation in which the diseased bone of a joint is cut out, in place of cutting off the whole limb. Dr. Druitt, in his able summary on this subject in *The Surgeon's Vade-mecum*, remarks, that 'it seems to be established that excision is on the whole safer than amputation; less violence is done to the body, fewer great arteries and nerves are injured, and, what is of more consequence, fewer large veins are divided, and as the articular end of the bone only is sawn off, and the medullary canal not touched, there is less chance of pyæmia. Lastly, the patient is left with an imperfect limb, it is true, but with one which, in most cases, is highly useful.' The operation has been performed on the ankle-joint, the elbow, hip-joint, knee, and shoulder. Few subjects have in recent times excited more discussion among surgeons than the application of this operation to the knee-joint. The operation was first performed in 1762; and up to the year 1830, there are records of 19 cases, out of which 11 died. From 1830 to 1850, the operation was never performed, and was generally condemned; but in the last-named year it was revived by Professor Fergusson, and is now a frequent and regularly-recognized operation. 'The cases,' says Dr. Druitt, 'in which it ought to be performed are, generally speaking, such cases of injury or disease as would otherwise be submitted to amputation.'

The object of the operation is to produce a firm and useful limb, slightly shortened, and with entire bony union or fibrous union, admitting of some small degree of motion at the situation of the joint. But all cases are not suitable for excision; and those cases are unsuitable and better adapted for amputation in which either the quantity of the diseased bone is very great (for then the case will probably not do well, or, if it proceed to recovery, and the patient be young, the future growth of the limb will be prevented), or the quality of the disease may be such as experience has shown to be incompatible with the exudation of healthy material of repair.' In at least 50 per cent., the operation results in a good useful leg. It has already saved so many limbs that it must be regarded as one of the greatest triumphs of modern surgery.—Further information on this subject may be found in Professor Fergusson's *Lectures on Conservative Surgery*, delivered in 1864 at the Royal College of Surgeons, and reports in *The Lancet*.

RESEDA'CEÆ, a natural order of exogenous plants, mostly herbaceous; having alternate leaves; terminal spikes of hermaphrodite irregular flowers; the calyx of 4–7 unequal segments; the corolla of 4–7 petals, alternate with the segments of the calyx, the lower petals entire, the upper much cut; the stamens 10–30, inserted on a fleshy receptacle; the germen free, one-celled; the fruit a many-seeded capsule, three-horned, and often open at the apex, so as to expose the seeds, which are kidney-shaped. There are about forty known species, mostly natives of Europe and the west of Asia, and mostly mere weeds. Weld (q. v.) and Mignone (q. v.) are the species most worthy of notice.

RESERVATION is a term used in lease and also in grants of a less estate than the fee-simple. Thus, if A, the owner in fee-simple of real estate, grant a lease to B, a third party, he does not give away his whole interest but merely a part of it, and that part not given away is said to be reserved or excepted. The word reservation is, however, chiefly used in reference to rent, it being said that a landlord on letting his land, reserves to himself a rent out of the premises, and he has certain well-known remedies for the recovery of such Rent (q. v.).

RESERVATION, MENTAL (Lat. *reservatio* or *restrictio mentalis*) the act of reserving or holding back some word or clause which

is necessary to convey fully the meaning really intended by the speaker. It differs from equivocation (Lat. *equivocatio* or *ambibolia*) in this, that in the latter the words employed, although doubtful, and perhaps not fitted naturally to convey the real meaning of the speaker, are yet, absolutely speaking, and without the addition of any further word or clause, susceptible of that meaning. Thus, an example of an equivocation would be: 'I did not write this libel,' meaning, 'I did not perform the mechanical operation of *writing it with a pen*,' although I had really composed and issued it. A mental reservation might be involved in the same words, if one were to say: 'I did not write this libel,' mentally withholding the word 'to-day,' although he had written it 'yesterday,' or on some earlier day. Few questions in casuistry have excited more controversy, or have been the subject of fiercer recrimination, than that of the lawfulness of equivocation and mental reservation.

In the celebrated *Letters of Pascal* (q. v.) against the Jesuits, it was one of the most prominent, and used as he employed it, the most effective topics; and Pascal's charges against the Jesuit casuistry of that day have been repeated in almost every popular controversy on the subject which has since arisen. There are several varieties of mental reservation, differing from each other, and all differing from equivocation under its several forms. But as regards the morality of the subject, all the forms of language calculated to deceive may be classed together, and may be treated according to the same common principles. Mental reservation is of two kinds, *purely mental* and *not purely mental*. By the former designation is meant a mental reservation which cannot be detected, whether in the words themselves, or in the circumstances in which they are spoken. Of this kind, would be the mental reservation implied if a person, on being asked if he had seen A. B. (whom he really had just seen *walking by*), were to reply: 'I have not seen him,' meaning '*riding on horseback*.' A 'not purely mental' reservation is that which, although not naturally implied or contained in the words, may nevertheless be inferred or suspected, either from them or the circumstances in which they are used. Of this kind would be the mental reservation of a servant, in giving the ordinary answer to a visitor's inquiry for his master: 'Not at home,' although his master were really in the house; or that of a confessor, who, in a country where the privileges of the secret of the confessional are known and admitted, on being asked whether a certain person had committed a crime, which the confessor knew from his confession that he had committed, should answer: 'I do not know,' meaning 'outside of the confessional.' And, in general, all such doubtful forms, whether of mental reservation or of equivocation, may be divided into *discoverable* and *undiscoverable*.

Much, although certainly not all the odium which has been excited against the casuists for their teaching on this head, has arisen from the confusion of their views as to these two classes of mental reservation; and the witty ingenuity with which Pascal mixed up examples of both, and applied to one what was really said of the other, did far more to damage the theological reputation of his adversaries, as a school, than any of the genuine really objectionable decisions which he cited from the writings of individual divines. Mental reservation has formed a subject of discussion for Protestant as well as Catholic divines; but without entering into a detailed history of this curious branch of casuistry, we shall content ourselves with stating briefly the chief principles on which the decisions of the most approved writers, especially of the Roman Catholic School, are founded.

First, 'purely mental' reservations, and 'absolutely undiscoverable' equivocations, are held to be in all cases unlawful, such forms of speech being in truth lies; inasmuch as they have but one real sense, which is not the sense intended by the person who uses them, and hence can only serve to deceive. This doctrine is held by all sound Catholic casuists, and the contradictory doctrine is expressly condemned by Pope Innocent XI. (Prop. 26, 27). On the contrary, mental reservations 'not purely mental,' and 'discoverable' equivocations, are held to be not inconsistent with truth, and, in certain circumstances, when there is necessity or weighty reason for resorting to them, allowable.

For the absolute admissibility of the expedient of mental reservation and of equivocation in such circumstances, casuists allege scriptural precedent from Genesis xx. 12, Matt. xi. 14, Acts xxiii. 6, and other passages; and the principles on which their use, in such case, is defended, are (1), that there is supposed to be in the circumstances justification, and even necessity, for not making known the whole truth; and (2) that the mental reservation in the case supposed does not amount to more than a mere *withholding the entire truth*, inasmuch as what is stated is absolutely true, and the real meaning of the speaker is absolutely contained in it, and *discoverable from it*; and the false construction put upon it by the hearer, although permitted through necessity or grave reason by the speaker, is not *positively* put forward by him. A historical example of such equivocation or reservation is in the well-known answer of St. Athanasius to the question of the party

who were in pursuit of him, and who, overtaking him, but not knowing his person, asked what way Athanasius had gone. '*He is not far off*,' replied Athanasius, and the party passed on in pursuit. A less easily discoverable equivocation is ascribed to St. Francis of Assisi, who, when a gang of robbers in pursuit of a traveler asked him whether he had seen the traveler pass by, put his hand up the sleeve of his habit, and replied: 'He did not pass *this way*,' meaning, 'up his sleeve.' And an ordinary example of discoverable mental reservation is that of a person who, on being asked by one to whom he could not with safety give a refusal, whether he has any money, should reply: 'No,' meaning, 'none to lend to you.'

In order, however, to justify the use of these devices of speech casuists require that there shall be some grave and urgent reason on the speaker's part; as, for example, the necessity of keeping a state secret, or a secret of the confessional, or of a professional character, or even the confidence intrusted by a friend, or the ordinary and fitting privacy which is required for the comfort and security of domestic life, and of the peaceful intercourse of society; and that the concealed sense of the form of speech employed, although it may be *actually undiscovered*, and even unlikely to be discovered, may yet be, in all the circumstances, *really discoverable*. On these two leading theoretical principles, the majority of casuists are agreed. But a wide field for practical discussion lies between them, in the variety of senses which may be attached to the phrases 'not purely mental' and 'discoverable'; and it is in the practical interpretation of these terms that some of the casuists have found scope for the introduction of the lax decisions which have brought odium upon casuistry. Much of this odium has fallen upon the Society of the Jesuits, to such a degree, that their name has been popularly associated with the worst forms of the practice of mental reservation. See JESUITS and PASCAL.—See Scavini, *Theologia Moralis*, ii. 23; Murray, *Theological Essays*, iv. 274, and foll.

RESERVATUM ECCLESIASTICUM, a provision of the religious Peace of Westphalia, so very celebrated in Germany history, that a brief explanation seems necessary. By this clause of the Treaty of Westphalia (1549), it was enacted, that if the holder of any ecclesiastical dignity, or of any territorial jurisdiction or property annexed to such ecclesiastical dignity, should change his religion, the dignity, territorial jurisdiction, or property held by him, should not be thereby alienated from the church from which he seceded, but should be still 'reserved' for that church, and for the legitimate successors of the seceder. It was chiefly out of the disputes regarding the violations of the R. E., that the Thirty Years' War arose.

RESERVE, in Army affairs, has several meanings. First, in a battle, the reserve is a body of troops held somewhere in the rear, generally out of fire, and kept fresh, in order that they may interfere with decisive force at any point where yielding troops require support, or an advantage gained needs powerful following up. The reserve of ammunition is a magazine of warlike stores, situated between an army and its base of operations, sufficiently retired from the front to be safe from sudden raids of the enemy, and at the same time advanced enough to allow of the supply actually in the field being speedily replenished.

The reserve of a nation is that force upon which the national defence is thrown, when its regular armies have failed in securing its safety. This reserve may be the *levée en masse* of the whole adult male population, or it may consist of a smaller section of the people duly trained to arms. The latter is, of course, the preferable system, when the arms of scientific modern warfare are to be brought into action. In different countries, the reserves are organized on very different principles. In Great Britain, they comprise the army reserve, the enrolled pensioners—both of which consist of soldiers who have served in the army—the militia, yeomanry, volunteers, and trained constabulary. The numbers of the reserve forces provided for in the army estimates of 1880—1881 were as follows:

Militia.....	139,111
Yeomanry Cavalry.....	14,511
Volunteers.....	245,648
Army Reserve Force (including Enrolled Pensioners)—First Class.....	23,000
Second Class.....	24,000
	446,270

Of the volunteers, 43,499 were artillery volunteers, 600 light horse, 9870 engineers, 120 mounted rifles, 1440 permanent staff, and 190,119 rifle volunteers.

The scheme of army reorganizations, which has been carried out during the past few years, has had a very important bearing on the reserve forces. In 1870, it was attempted, by modifying somewhat the conditions of enlistment into the regular army, to make the provisions for securing and maintaining a numerically strong army reserve more efficient than they had hitherto

been. Enlistment continued as before to be for twelve years; but service in regiments going abroad was to be for six years, while the remaining six years' service was to be in the reserve, the men being liable to be called out like the naval reserve, and receiving a pay of 4*l.* a day. In 1876, men commenced to pass from the colors into the Reserve which is expected ultimately to reach about 80,000 men.

By an order in council of the 31st March 1871, the power of the Lord Lieutenants ceases, and the management of the reserve forces in counties is vested in the ministers of the crown.

One of the objects chiefly kept in view in the comprehensive scheme of 1872 for the reorganization of the army, was the bringing of the auxiliary forces into closer and more mutually helpful relations with the regular army. The main feature of that scheme is the localization of the combined military forces in certain territorial districts, so that there shall belong to each such district two line battalions, two militia battalions, and volunteers, formed into an administrative brigade, the whole to rest on the brigade depot as center. Arrangements were made to secure that a larger number of officers of the line regiments should pass into the militia and the yeomanry, and that the efficiency of the reserve should increase. The aim of the measure was 'to unite the spontaneity and all the other advantages of the auxiliary forces with the highest amount of training that the regular army could furnish to any other body of men.

RESERVED LIST, in the Royal Navy, a device for expediting the promotion of officers who are still of an age for active service. Under certain Orders in Council of 1851 and 1853, old officers of good service were selected for promotion to the next grade on the Reserved List. This formed a bar to any other promotion; and removed the officer from active employment, except in the remote contingency of the Active List being exhausted, when these 'reserved' officers would be liable to be called upon to serve. For all practical purposes, however, the Reserved List was a retired list. The officers placed on it obtained the half-pay of the rank to which they were promoted, and their removal gave vacancies for the promotion of younger and more efficient men. In the navy estimates for 1882—1883 while provision was made for 547 naval officers on the unemployed active list, and for 2267 on the retired list, a sum of £31,435 was allotted to 96 naval officers on the reserved list. The list is dying out, as, under the Retirement Scheme of 1870, absolute retirement according to age was substituted.

RESERVOIR, a receptacle for storing water for any purpose, but chiefly for the supply of towns, for driving machinery, feeding canals, irrigation, or for some process of manufactures. Generally, every water-works' establishment, for the supply of a town, requires to construct one or more reservoirs for providing compensation to the mills situated on the stream, for the water that is abstracted from any of its feeders.

The most advantageous position for a store reservoir is that where there is a narrow gorge in a valley widening out upwards into a flat expanse, thereby enabling a comparatively small dam or embankment formed in the gorge, to impound a large body of water; but in many cases where there is no such choice the embankment may require to be placed across a wide part of a valley which narrows as it ascends, thereby requiring a great embankment, in proportion to the quantity of water impounded. Sometimes reservoirs have to be formed on flatish ground affording no great natural facilities for storing water; and in such cases they may require to be embanked wholly or nearly round and round. Where a reservoir requires to be constructed on perfectly level ground, the excavation must be calculated to be exactly equal to the embanking. The worst possible situation for a store reservoir is on the slope of a hill.

In many cases, natural lakes are used as reservoirs, means being adopted for raising or lowering the surface of the water, the difference between the lowest and the highest level of the lake's surface, multiplied by its area, being the measure of the available storage. Instances of this occur in Loch Leven, Kinross-shire, for the supply of the mills on the river Leven; in Loch Katrine and Loch Vennachar, for the supply of the city of Glasgow, and for the compensation required by the millers on the river Teith, in consequence of the abstraction of the Loch Katrine water; and in many other similar cases both for the use of towns and for water-power.

The capacity of a reservoir necessary for making nearly the whole water of a district available for use, depends much on the climate. Where droughts are of long continuance, its capacity requires to be proportionally large, but generally in Great Britain a capacity of six or seven months' supply is reckoned sufficient.

As illustrative of the very different facilities afforded by different sites for storing water, an instance occurs of two reservoirs of the Edinburgh Water Trust, whereof one with an embankment containing 175,000 cubic yards of earthwork impounds only 17 millions of cubic feet of water; while another, with an

embankment of 53,000 cubic yards, impounds 85 millions of cubic feet, there being a single embankment across a valley in both cases. Generally, the structure for impounding water is an earthwork embankment, with a slope towards the water of 3 or 4 horizontal to 1 perpendicular, a breadth across the top of from 6 to 12 feet, the height being from 4 to 7 feet above the water, and

Fig. 1.—Elevation of Reservoir.

an outside slope of from 2 to 2½ horizontal to 1 perpendicular. The earthwork ought to be formed in thin layers well rammed, and to have a puddle-wall of good well-worked clay in the center, the foundation of the puddle being a trench dug down to impervious rock or clay. The face towards the water requires to be pro-

Fig. 2.—Transvers : Section of Reservoir.

tected by stones; and when a reservoir is large, these stones must be 'pitched' i. e., regularly set by hand—so as to be able to resist the lash of the wave. In all cases, there is imperatively required a waste-weir, to allow flood-waters to escape without risk of overflowing the dam. It ought, if possible, to be placed on the solid ground; and if it can be cut through solid rock, that is best, and saves a great expense for masonry.

The width of the waste-weir must be regulated by the catchment or extent of gathering-ground of the reservoir, and by the rainfall of the district; but for a given catchment and rainfall, a reservoir having a small area ought to have a larger waste-weir than one having a larger area, as the latter would allow flood-water to accumulate without rising to so high a level as it would in the former. Generally, however, from 12 to 20 feet of length of waste-weir may suffice for a square mile of catchment. In some cases, dams across gorges, for the purpose of forming reservoirs, are constructed of walls of heavy masonry, instead of earthwork embankments. Those across rivers for diverting the water into mill-lades, and for retaining the water which would otherwise be wasted at meal-hours, are generally constructed of stone, but sometimes of timber or iron.

The word dam is very often used incorrectly in Scotland to indicate a reservoir or sheet of water, instead of the structure made use of to form the reservoir, which is its proper meaning. A reservoir requires a sufficient outlet at the bottom by means of a tunnel, culvert, or iron pipes provided with suitable sluices, and these ought properly to be so arranged as that access can be had to them even when the reservoir is full.

Most of the disasters from the bursting of reservoirs have arisen from the want of sufficient waste-weirs, and from the embankments being overtopped in consequence by the water, and the outer slope being washed away, so as to deprive the puddle-wall of its support; but some accidents have occurred from the outlet being by a wooden box or trough through the embankment, and that being neglected and allowed to get rotten. The bursting of the Bilberry Reservoir, above Holmfirth, which occurred in 1852, arose from the embankment having sunk to, and being allowed to remain at, a level actually below that of the waste-weir, so that it was over topped; but the Bradford Reservoir embankment of the Sheffield Water-works which burst in 1864, gave way before the water had risen to the level of the waste-weir; and much difference of opinion exists as to the cause; some engineers contending that the disaster was caused by bad workmanship in the embankment itself, and others that it was owing to a landslip under the embankment.

Distributing reservoirs for towns, used chiefly for storing up the surplus water during the night, which otherwise might mostly go to waste, ought to hold at least half a day's supply, and ought to be placed high enough to command the highest parts of the town. They are generally built of masonry or brickwork, but are sometimes made of cast iron, and now occasionally of boiler-plate—in which last case they are best of circular form. There is one of that description on the highest part of Edinburgh Castle. In

India and in the south of Europe, where long droughts prevail, very large reservoirs have been constructed for supplying water for the purpose of irrigation.

RESHD, one of the most industrious and extensively commercial towns in Persia, capital of the maritime province of Ghilan, stands on the Bay of Enzelli, a lagoon on the south-west shore of the Caspian Sea, 150 miles north-west of Teheran. It is in great part covered with trees, so that no accurate idea of its extent can be obtained by viewing it from any one point. The houses are all tiled and are neatly built, and the streets paved; water is supplied by an aqueduct, and there are a palace, vast, gloomy, and ruinous; numerous caravanseras, large bazaars, and about 1200 shops and warehouses. Indian wares are imported from Belfrush, in Mazanderan, and European manufactures from Russian Armenia. Extensive manufactures of deservedly celebrated embroideries are carried on. Pop. upwards of 20,000. Enzelli, the port of R., on the Caspian Sea, about 18 miles distant, has 2500 inhabitants.—Eastwick's *Diplomate's Residence in Persia* (London, 1864.)

RESIDUARY LEGACY is a legacy of all that remains after the debts and legacies have been paid out of the estate of a deceased person. Debts must always be paid before legacies, and the next thing to be done is to pay all the express legacies; and as these seldom absorb the whole of the free assets, the residuary legacy is more or less valuable according as the express legacies are smaller than the free assets. If the express legacies swallow up all the funds, the residuary legacy is worth nothing.

RESINA, a town of Southern Italy, in the province of Naples, situated at the foot of Vesuvius, and facing the sea. Pop. (1871) 12,175. R. is built on the site of ancient Herculaneum. Exquisite fruits are grown, and the famous *Lacrima Christi* wine is made in the vicinity. It is surrounded by country houses, and is a place of recreation for the Neapolitans, on account of its salubrity. The ascent of Mount Vesuvius is begun at Resina.

RE'SINS, a class of natural vegetable products composed of carbon, hydrogen, and oxygen. They are closely allied to the essential oils, all of which, when exposed to the air, absorb oxygen, and finally become converted into substances having the characters of resin; and in most cases, they are obtained from the plants which yield them, mixed with and dissolved in a corresponding essential oil. Like the natural oils, the natural resins are usually mixtures of two or more distinct resins, which admit of separation by their unequal solubility in different fluids.

The following are the general characters of this class of compounds. At ordinary temperatures they are solid, translucent, and for the most part colored, although some are colorless and transparent. Some are devoid of odor, while others give off an aromatic fragrance from the admixture of an essential oil. In their crude state, they never crystallize, but are amorphous and brittle, breaking with a conchoidal fracture; when pure, several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoky flame. They are usually described as non-volatile, but it has been recently shown that common resin may be distilled in a current of super-heated steam. They are insoluble in water, but dissolve in alcohol, ether, and the essential and fixed oils. They are insulators or nonconductors of electricity, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions reddens litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by chloride of sodium.

The resins are divisible into the *hard resins*, the *soft resins*, and the *gum resins*.—The hard resins are at ordinary temperatures solid and brittle; they are easily pulverized, and contain little or no essential oil. Under this head are included copal, the varieties of lac, mastic, and sandarach, and the resins of benzoin (commonly called gum-benzoin), jalap, guaiacum, &c.—The soft resins admit of being moulded by the hand, and some of them are viscous and semi-fluid, in which case they are termed *balsams*. They consist essentially of solutions of hard resins in essential oils, or admixtures of the two. They become oxidized and hardened by exposure to the air into the first class of resins. Under this head are placed turpentine, storax, balsam of copaiba, and the balsams of Canada, Peru, and Tolu.

The gum resins are the milky juices of certain plants solidified by exposure to the air. They consist of a mixture of resins and essential oils with a considerable proportion of gum; and on this account, when rubbed up with water, they yield a turbid or milky fluid from the dissolved gum, retaining the resin and oil in suspension, and are only partly soluble in alcohol. Some of them, as ammoniacum, asafoetida, euphorbium, galbanum, gamboge, myrrh, olibanum, &c., are valuable medicinal agents; while others, as caoutchouc (or india-rubber) and gutta percha, are of great value in the arts and in manufactures.

The resins are very widely diffused throughout the vegetable kingdom. But there are certain families of plants which are especially rich in them. They are generally obtained by making incisions into the wood of the trees which produce them; sometimes, however, they exude spontaneously, and in other cases require to be extracted from the wood by boiling alcohol. The crude resins are separated from the essential oils with which they are usually mixed, by distillation with water, the resin remaining while the oil and water pass off; and from the gummy and mucilaginous matters, by alcohol, which dissolves out the pure resins, which can be precipitated from their alcoholic solution by the addition of water.

The resins are extensively employed in medicine; and in addition to the almost innumerable applications of caoutchouc and gutta percha, various resins are of service in the preparation of varnishes, soaps, pigments, artificial light (resin-gas), &c.

Various fossil resins are known, of which the most important is amber. Some chemists place bitumen and asphalt amongst this class; and amongst the fossil resins described by mineralogists may be mentioned Fichtelite, Hartite, Idrialite, Ozokerite, Scheereite, Xyloretin, &c.

The common resin, or rosin, of commerce exudes in a semi-fluid state from several species of pine, especially *Pinus tæda*, *P. mitis*, *P. palustris*, and *P. rigida* of North America, *P. pinaster*, *P. pinea*, and *P. Laricio* of Southern Europe, and *P. sylvestris* of Northern Europe. The process of collecting it is very simple: a longitudinal slice of the bark and wood (A, fig. 1), about a foot

Fig. 1.

Fig. 2.

in length, is taken off by means of an axe with a curved blade (fig. 2); and at the bottom of the groove thus made, a small piece of bent wood or thin metal, as tin or zinc, is driven into a curved cut, made by one blow of the axe (B, fig. 1); this forms a sort of spout, which catches the liquid resin as it runs from the wound, and guides it into a small pot, made of common clay burned. At certain periods, these pots are emptied and their contents put into casks, for transport to the distilleries, where the volatile essential oil is removed from the resin. The resin thus procured is used very extensively in the manufacture of common yellow soap, also for sizing paper and various other purposes, including the preparation of ointments and plasters in pharmacy.

The other resins most generally known and used in Europe are Anime (q. v.), Copal (q. v.), Dammar (q. v.), Mastic (q. v.), Sandarach (q. v.), Frankincense (q. v.), Lac (q. v.). In addition to these, there are many which are of essential service in other countries, as the Piny Resin or Dhoop, obtained from *Vateria indica*; Black Dammar, obtained from *Canarium strictum*; Saul Resin, or Dammar Batu, from *Shorea robusta*—all of which serve many useful purposes in India, China, Japan, and other Asiatic countries. The forest of South America furnish many others.

RESISTING A CONSTABLE is an offence punishable by justices of the peace in a summary manner.

RES JUDICATA, in Law, means that the subject-matter of an action has been already decided by a court of competent jurisdiction, and if so, a plea setting up the *res judicata* is a sufficient defence. In order to be binding, however, the suit in the former case must have been between the same parties.

RESOLUTION, in Music. In the progression of chords in a musical composition, there are certain chords that require to be followed by certain others, or, as it is called, *resolved* into them, otherwise, a sense of incompleteness is left on the ear. Thus the chord of the dominant seventh must be resolved by the tonic harmony, the major third ascending a semitone to the key-note, and the seventh descending one degree to the third of the key.

The diminished triad is similarly resolved, and all chords immediately derived from the dominant harmony. The chord of the added ninth is resolved by descending a second to the fifth of the tonic.

RESOLUTION OF FORCES. See COMPOSITION.

RES'OLUTIVE CLAUSE is the technical name given by the law of Scotland to a clause in a deed of entail, the object of which is to declare that if the heir of entail in possession do any of the things which he is expressly prohibited from doing, such as attempting to sell the estate, or alter the order of succession, his right to the estate shall cease, and the estate shall pass on to the next heir.

* RESPE'CTING, or RESPECTANT, in Heraldry, a term used to describe two animals borne face to face. Beasts of prey rampant when so borne, are, however, said to be *rampant combatant*.

RESPIRA'TION, ORGANS AND PROCESS OF. The great objects of respiration or breathing are, first, the introduction into the system of oxygen, by which the products resulting from the disintegration or breaking up of the muscular, nervous, and other tissues of the body are converted into compounds, which are easily eliminated or removed by the excreting organs (as the kidneys, lungs, skin, &c.); and, secondly, the removal of the most noxious, and consequently, the most important of these products, carbonic acid, through special respiratory organs, which, in most air-breathing animals, except insects, are lungs; while in water-breathing animals, excepting those very low in the scale of organization, they take the form of *branchiæ*, or gills. In all the vertebrated animals, excepting in fishes, and in the amphibians during their young state,* the respiratory organs are more or less complicated internal air-sacs, communicating through the throat with the external atmosphere. The simplest known form in which these LUNGS or internal air-sacs exist is as a pair of elastic membranous bags placed close beneath the vertebral column, communicating with the surrounding atmosphere by a tube known as the windpipe, or *trachea*, which opens through the larynx, or organ of voice, into the throat. These bags are lined by a delicate, thin, and moist membrane, called a mucous membrane, embedded in, and partly beneath which is a vascular network, through which all the blood in the animal's body is in turn driven by the heart. The moist partition between the blood in this network and the air in the interior of the lungs is so thin, that after having (by its moisture) dissolved the oxygen of the air, it permits of its passage into the moving current of blood, whilst through the same agencies carbonic acid simultaneously passes in an opposite direction from the blood into the air.

To complete the apparatus, there are certain muscles under whose action the bags are emptied of their vitiated contents, and refilled with pure air. Such are the respiratory organs as they occur in that remarkable animal, the *Proteus anguinus*, found in the dark caves of Carinthia, and belonging to the order *Amphipneusta*, referred to in the foot-note. In the more highly organized animals and in man, we find these elementary essential parts complicated and modified in a great variety of ways. Confining our remarks for the present to the respiratory process as it occurs in man and mammals, we may consider the anatomical details under three different heads. *First*, There must be a special respiratory organ—the lungs—affording by its internal arrangement an immense extent of internal surface, covered by vascular network, through which the blood flows in innumerable minute streamlets, only separated by an extremely thin membrane from the atmospheric air that has been inhaled; *secondly*, There must be such an arrangement of the circulating system that fresh blood may be perpetually driven from the right side of the heart through the lungs, and onward to the left side of the heart; and *thirdly*, There must be arrangements for the frequent and regular change of the air contained in the lungs. These three points will be considered in the order in which we have placed them.

A sufficiently large internal aerating surface might of course be obtained by increasing the size of the air-bags themselves, but this would involve an increase of size in the animal. In examining the lungs of different animals, two plans are observed for increasing the internal surface without increasing the total bulk of the lungs.

According to one plan, the internal surface is, as it were, moulded into cells, separated laterally by partitions, somewhat like the cells as seen in a section of honeycomb, or more like the appearance presented by the second or honeycomb stomach of ruminating animals; according to the other, enormous multitudes of little lung-sacs partitioned, as will be presently shown, in their interior, are clustered round the ultimate branch of a common air-tube, which communicates with all of them. If we can conceive a bunch of grapes with its stem and all its minute branches, and the grapes attached to the ends of these branches completely hollowed, we get a good idea of this second plan, except in so far as the partitioning of the terminal cells (the grapes in the illustration) is concerned. By the former method, which occurs in amphibians and reptiles, the lung-sacs are merely ren-

dered more cellular in their interior; whilst, by the latter plan, compound lungs are formed, such as occur in birds and mammals, including man. Hence these two varieties of lung-structure correspond to the so-called cold-blooded and warm-blooded animals respectively. In fig. 1, representing a section of the

Fig. 1.

lungs of the frog (magnified), and in fig. 5 of the art. REPTILES, representing a section of the lungs of a turtle (diminished), we have illustrations of the first plan (the cellular lung-sac), while in figures 2 and 3 we have diagrammatic illustrations of the human lung. Figure 2 is a shaded diagram (copied from Mr.

Fig. 2.

Marshall's admirable series of *Physiological Diagrams*), to show the ramifications of the air-tubes in the human lungs. L is an outline representing the left lung; T, the main air-tube, called the windpipe or *trachea* (so called from the Greek word *tracheia*, rough, and similarly termed in Latin the *Arteria aspera*, although not an artery, as we now employ the word), descends through the neck from the larynx or organ of voice into the chest; B shows the right and left *bronchi*, or primary divisions into which the windpipe separates, one for each lung.

Each bronchus enters the lung at the so-called root, and divides and subdivides into smaller branches, which never coalesce, but continue separate like the branches and twigs of a tree. These are the *bronchial tubes*, or the *bronchia* of some writers; the smallest shown in this diagram, *b, b*, undergo many further subdivisions, until (to use Mr. Marshall's own description) 'at length they form an immense number of minute tubes, not more than $\frac{1}{16}$ th of an inch in diameter, each of which ends in a cluster of cells, or, as it may otherwise be described, opens into a small membranous sac, a little wider than itself, having a cellular internal surface very similar to that of the frog's lung, but of course on a microscopic scale.' In fig. 3 (also copied from Mr. Marshall's diagrams), there is a representation, magnified about 100 diameters, of three of these clusters of cells or little lung-sacs, from the human lung. In this figure *b* is a small air-tube, or bronchial tube, from which several of the finest or ultimate tubes proceed; *c* shows the outer surface of one of the lung-sacs, or *lobules*, as they are commonly termed; *d*, the inner surface of another, which has been cut open, so as to show the ultimate recesses of the lung to which the air has access—viz., the *air-cells*. According to Rossignol, the ultimate bronchial ramifications terminate in a shape resembling that of an inverted funnel, and hence he applies the term *infundibula* to these endings. In fig. 4 (copied from Rossignol's *Memoir*), there is a representation of the termination of an ultimate bronchial tube in the lung of a dog: *a* represents an ultimate tube, or lobular passage, branching towards the *infundibula*; *b* is the interior of one of the seven in-

* A few of the amphibians, such as the species of the genera *Proteus* and *Siren*, retain their branchiæ during their whole life; hence they are placed in the order *Amphipneusta*, a term indicating their double mode of breathing.

fundibula shown in the figure; while *c* represents one of the numerous septa or partitions projecting inwards on the infundibular wall, and forming the air-cells.

Fig. 3.

Fig. 4.

According to Todd and Bowman, the diameter of the lobular passages is from $\frac{1}{100}$ th to $\frac{1}{200}$ th of an inch, while that of the cells ranges from $\frac{1}{200}$ th to $\frac{1}{100}$ th of an inch. It is on the inner surface of these air-cells that the network of minute capillaries is spread in which the act of aëration takes place. Each lobule receives air through its own bronchial tube alone, and consequently there is no direct communication between the air-cells of adjacent lobules. These lobules are closely compressed upon one another; and collectively, together with the connective tissue which unites them to one another, make up the great mass of the lungs. To such an extent is the process of subdivision carried out, that, according to calculation, the lungs of an adult man contain at least 600 millions of these air-cells. It is in consequence of the air included in these cells that the pulmonary tissue has a soft spongy feel, and crackles when compressed between the fingers (see **RESPIRATORY SOUNDS**); and for the same reason, the lungs and even small portions of them, even after strong pressure, float in water, it being extremely difficult to drive all the air out of the cells. The lungs (except in the foetal state, when no air enters them) are thus the lightest organs, in relation to their size, in the body.

Although their bulk is so great that, with the heart, they occupy almost the whole of the cavity of the chest, they only weigh about three pounds and a half in men, and two pounds and three-quarters in women. Their color varies at different ages. At birth, they are of a pinkish white tint; in adult life, they are of a slate color, and present a mottled appearance; and in old age, they become a still darker tint. The polygonal markings which are seen on the surface correspond to the outer surface of the lobules already noticed. Their shape is adapted to that of the cavity in which they are lodged, each lung being conical in form, with its apex rising into the neck; while its base, which is broad and concave, rests upon the convex surface of the diaphragm; and between the two lungs lie the heart and the great vessels that proceed from it. During life (except in certain diseases, as for instance, **PERICARDITIS**, q. v.), the inner margins of the lungs nearly overlap the heart, leaving only a roundish space, less than two inches in diameter, of that organ uncovered, while their lower borders extend to the cartilages of the ribs, and fit into the angle formed between those cartilages and the diaphragm. Each lung is invested by its own serous membrane, the **PLEURA** (q. v.), which serves the double purpose of facilitating the movements which the lungs undergo in the act of respiration, and of suspending each lung in its proper position. In the latter function, the pleuræ are essentially assisted by the great air-tubes and blood-vessels, which collectively form what are termed the roots of the lungs.

The structure of the air-tubes and the lungs themselves next requires consideration. Beginning with the upper portion, we have to consider the *trachea*, or windpipe, which in the human subject descends in the middle line from the *Larynx* (q. v.) to the level of the third dorsal vertebra, where it divides into the right and left bronchi (as seen in fig. 2). It is kept permanently open by from 16 to 20 cartilaginous rings, which surround two-thirds of the tube, and are incomplete behind, where the tube is completed by the same fibrous membrane which covers and unites the cartilages in front and on the sides. In this fibrous membrane are numerous tracheal glands (which probably furnish much of the vapor of the breath, and may occasion its odor), together with unstriated muscular fibre, to which the term *trachealis* muscle has been given. The trachea measures about $4\frac{1}{2}$ inches in length, and is about three-quarters of an inch wide. Its mucous membrane is continuous through the glottis with that of the pharynx or throat, and is covered with ciliated columnar Epithelium (q. v.). Of the bronchi, the right

is wider, shorter, and more horizontal than the left. Their walls are composed on the same plan as those of the trachea. Upon entering the lung, each bronchus divides in the method already described. The walls of these bronchial tubes become thinner as they approach the air-cells. The cartilaginous portions which, in the primary divisions of each bronchus, partially retained the annular form, become gradually reduced to mere flakes, and finally cease in tubes of $\frac{1}{4}$ th or $\frac{1}{10}$ th of an inch in diameter. The unstriated muscular fibres occurring in the trachea are continued downwards to the minutest tubes, forming a very thin layer, completely surrounding the canal, and the ciliated epithelium extends equally far. The terminal bronchial tube loses its epithelium and muscular coat at about $\frac{1}{4}$ th of an inch from the most distant air-cell to which it leads, and is thus reduced to a single coat, consisting of a basement membrane (see **MUCOUS MEMBRANE**), with yellow elastic fibres blended with it. Of this structure, the interlobular passages and the air-cells are composed.

The mode in which the blood is perpetually changed in the lungs next demands consideration. The venous or impure blood collected from all parts of the body in the right side of the heart, is conveyed to the lungs by the pulmonary artery, which is about the size of the aorta, and, like that vessel, is furnished with three semilunar valves at its origin, which prevent the blood from regurgitating into the right ventricle of the heart (see **CIRCULATION**). The pulmonary artery divides, before entering the lungs, into a right and a left branch, which ramify as far as the lobules in company with the bronchial tubes. At this point, they distribute themselves on the outside of the lobules, in the so-called *interlobular fissures*, and penetrating between the air-cells, form a capillary network on and in the walls of the cells and of the lobular passages. This network empties its blood, which is now aërated, into minute venous radicles, which converge to form larger veins, and these finally form the four pulmonary veins, which discharge their arterialized blood into the left side of the heart. The walls which support the capillary network of the lungs are (as Todd and Bowman observe) 'for the most part much too thin to enclose the capillaries between the two layers of their substance, and therefore the capillaries project fairly into the air cells by a great part of their circumference, being adherent to the wall by a narrow line only. The capillary wall is thus exposed and bare, in contact with the air of the cell, and nothing besides the delicate membrane of the capillary intervenes between the air and the blood.'

'A capillary frequently passes through an aperture in the cell-wall, so as first to project into one cell, and further on into a contiguous one, but never becomes altogether free from the wall.'—*Phys. Anat.* v. ii. p. 393. The diameter of these capillaries is about $\frac{1}{200}$ th of an inch, which is comparatively large, and admits of the passage of blood freely; and the air and the blood may be said to be in contact, since they are only separated by a delicate capillary wall, less than $\frac{1}{2000}$ th of an inch in thickness. If the rate of the blood in the capillaries be taken at an inch and three-quarters per minute (according to the estimate of Valentin, drawn from observation of the frog's foot), it has been calculated that the blood would at each circuit remain in contact with the air about one second and a half. In all probability, however, the motion of the blood is quicker in the pulmonary capillaries of man and other mammals and of birds than in those of the frog's foot.

In addition to the pulmonary artery and pulmonary veins, which convey the blood to and from the lungs for the purpose of aëration, there are other vessels, known as the bronchial vessels, for the nutrition of the lung itself, the distribution of which, and their mode of communication with the pulmonary vessels already described, have been subjects of much discussion; but into this we need not enter. The lungs are supplied with nerves from the anterior and posterior pulmonary plexuses, lying at the root of the organ, and composed of filaments of the pneumogastric and sympathetic nerves. The filaments from these plexuses accompany the bronchial tubes, in which they are finally lost. The part which these nerves play in the respiratory process will be considered after we have described the *movements of respiration*, by which the air in the lungs is being perpetually changed.

For a description of the shape and framework of the chest, see **CHEST**. The chest (or thorax, as it is termed by anatomists) is so constructed as to be capable of enlargement in height (vertically), in depth (or from the front backwards), and in width (or from side to side). Its height is increased mainly by the descent of the diaphragm, and to a certain extent by the elevation of the ribs, and the widening of the intercostal spaces; while its depth and width are increased by the elevation of the ribs, which carry forward and elevate the breast-bone (or sternum), especially at its lowest end, and are slightly rotated on an imaginary axis, joining their extremities, by which their central portion is raised, and slightly removed from the mesial plane of the chest. It is only in forced or deep inspiration that all these means of enlarging the chest are called into play. An ordinary inspiration is at-

Fig. 5.—A separated Tracheal Ring.

r, representing the cartilaginous, and *m* the posterior flattened membranous portion.

ures about $4\frac{1}{2}$ inches in length, and is about three-quarters of an inch wide. Its mucous membrane is continuous through the glottis with that of the pharynx or throat, and is covered with ciliated columnar Epithelium (q. v.). Of the bronchi, the right

tended in men with very slight elevation of the ribs (about one-twentieth of an inch), while in women the elevation is much greater, especially in the upper ribs; the cause of this difference in the sexes probably lying in the narrower waist of the female requiring a compensation in the upper part of the chest. MM. Beau and Maissiat describe three varieties of ordinary respiration—viz., 1. Abdominal, or that chiefly effected by the diaphragm, and seen in the motion of the walls of the belly; 2. Costo-inferior, or that in which the seven lower ribs are observed to act; and 3. Costo-superior, or that effected in a considerable degree by the upper ribs.

The first variety occurs in infants up to the end of the third year, and in males generally; the second in boys after the age of

Fig. 6.

Diagrams (by Hutchinson) showing the extent of anteroposterior movement in ordinary, and in forced respiration in male and female. The back is supposed to be fixed, in order to throw forward the movement as much as possible. The black line indicates, by its two margins, the limits of ordinary inspiration and expiration. In forced inspiration, the body comes up to the dotted line, while in forced expiration it recedes to the smallest space indicated.

three, and in men; and the third in adult females. The difference between the depth of a forced and an ordinary inspiration is shown in the accompanying figures. Our limited space precludes a detailed notice of the various muscles which are concerned in respiration. The total power of the respiratory muscles has been measured by several physiologists, among whom Dr. Hutchinson deserves special notice. He finds, as the average of 1500 experiments, that the power of expiration is nearly one-third stronger than that of inspiration, and he is of opinion that when the expiratory are not stronger than the inspiratory muscles, some disease is present. He tested the force of the two classes of respiratory muscles by causing persons to make the most powerful efforts of which they were capable, when breathing through the nose into an instrument termed a spirometer, and by this means he found that men of five feet seven or eight inches in height have the greatest inspiratory power, it being equal, on an average, to a column of mercury of 2.75 inches, while their expiratory power was equal to 3.97 inches. The following table is given by him as exhibiting the range through which these powers may vary within the limits of health:

Power of Inspiration.		Power of Expiration.
1.5 inches.	Weak	2.0 inches.
2.0 "	Ordinary	2.5 "
4.5 "	Remarkable	5.8 "
7.0 "	Very extraordinary	10.0 "

The co-operation of the resilience of the lungs and the elasticity of the walls of the chest with the expiratory muscular movement is probably the cause why the expiratory power, as tested by the height of a column of mercury, is greater than the inspiratory power. Dr. Hutchinson calculates that a man who raises three inches of mercury by an effort of inspiration exerts a force equal to 1000 lbs.; while the one remarkable case in which the mercury rose to seven inches, indicated a force of 2200 lbs., or nearly two tons.

The following points in connection with the respiratory movements require notice. Every complete act of respiration is divisible into four parts—viz., 1. Inspiration; 2. A short pause, not always observed; 3. Expiration; and 4. A considerable pause, occupying, according to Vierordt, about one-fifth of the whole

time required for one complete respiratory act. The act of expiration is always more prolonged than that of inspiration, the former being to the latter in the ratio of 12 : 10 in adult males, and as 14 : 10 in children, women, and aged persons. The number of respiratory acts performed in a minute varies at different ages. According to Quetelet, at birth there are 44 respirations in one minute; at 5 years of age, 26; from 15 to 20, 20; from 20 to 25, 18.7; from 25 to 30, 16; from 30 to 50, 18.1: so that from 16 to 20 may be taken as the ordinary range for healthy adults, although Hutchinson gives the wide range of from 6 to 40. The average ratio which the number of respirations bears to the number of pulsations in a given time is about 1 : 44, and if there is any great deviation from this ratio, there is probably some obstruction to the aëration of the blood, or some disorder of the nervous system. Thus, in pneumonia (or inflammation of the lungs), in which a greater or less amount of pulmonary tissue is unfitted for its office, the number of the respirations increases in a more rapid proportion than the number of pulsations, so that the ratio becomes as 1 : 3, or even as 1 : 2. In hysteria, a similar or even greater deviation from the normal ratio may occur; and Elliotson records a case in which the respiratory movements were 98, or even 106, whilst the pulse was 104. On the other hand, in certain typhoid conditions, and in narcotic poisoning, the respiratory acts are diminished in number; the ratio of respiration to pulsations being 1 : 6, or even 1 : 8.

We have next to inquire into the mode in which the muscular movements of respiration are kept up by nervous power. 'There can be no doubt,' says Dr. Carpenter, 'that these movements, though partly under the control of the will, are essentially "automatic" in their nature. Their chief centers consist of two ganglia; corresponding to the origins of the pneumogastric nerves, which are the principal excitator nerves which convey the stimulus on which these movements are dependent; whilst from the adjacent parts of the medulla oblongata and spinalis proceed the chief motor nerves by which they are carried into effect. And thus it happens that the whole of the encephalon may be removed from above, and the spinal cord (as far up as the origin of the phrenic nerve) from below, without suspending the most essential of the respiratory movements.'—*Principles of Human Physiology* (6th edit., 1864, p. 274). It would carry us far beyond our assigned limits to notice the interesting series of phenomena that follow the division or irritation of the various branches of the pneumogastric nerve. We may, however, mention that when the trunks of this nerve are divided on both sides, the respiratory movements still go on, although with diminished activity. Hence, there must be other excitors to the action of the respiratory muscles. Amongst these, the nerves distributed to the general surface, and particularly to the face, probably perform an important part; and in exciting the first inspiration, the fifth pair seem the principal agent. In support of this view, Dr. Carpenter adduces the well-known fact, that the first inspiratory effort of the new-born infant is most vigorously performed when the cool external air comes in contact with its face.

Dr. Marshall Hall, in his *New Memoir on the True Spinal Marrow*, p. 29, relates a case in which the first inspiration was delayed simply because the face was protected from the atmosphere by the bedclothes; the instant they were lifted up, the infant breathed. Many familiar facts demonstrate the influence of the superficial nerves on the respiratory system in the adult as well as in the infant. 'Every one,' to use Dr. Carpenter's words, 'knows that the first plunge into cold water, or the first descent of the stream of the shower-bath, or even the dashing of a glass of cold water in the face, will produce inspiratory efforts; and this fact has many important practical applications. Thus, in the treatment of asphyxia, whether congenital or the result of narcotic poisoning, drowning, &c., the alternate application of cold and heat is found to be one of the most efficacious means of restoring the respiratory movements; and a paroxysm of hysterical laughter may be cut short by dashing a glass of cold water in the face.' The principal motor or efferent nerves concerned in bringing out the respiratory movements are the phrenic, going to the diaphragm; the intercostal, supplying the intercostal muscles; the facial and the spinal accessory nerves; although, as has been already mentioned, the superficial nerves generally exert a motor or efferent action.

How far the respiratory movements are under the influence of the will, is a question which has given rise to much discussion. That, in their ordinary mode of performance, they are independent of the will, is obvious from their systematic occurrence during sleep, in cases of paralysis in which the power of the will is lost, in apoplexy, &c. At the same time, universal experience teaches us that these movements are partly, but not entirely, under the control of the will. We can, with little inconvenience, suspend the respiratory actions for a minute or even longer, if we have previously introduced into the lungs a full supply of fresh air; but if the suspension be further prolonged, the stimulus conveyed by the excitator nerves to the nervous centers becomes so

strong, that by no effort of the will can we avoid making inspiratory efforts. It is asserted by M. Bourdon, an eminent French physiologist, in his *Recherches sur le Mécanisme de la Respiration*, that no person ever succeeded in committing suicide by simply holding the breath, but that such persons have attained their object by holding the face under water, because here another set of muscles is called into play, which are much more under the control of the will than those of respiration. If we may venture to seek for the reason why, in man and the higher animals, the respiratory actions are placed under the direction of the will, it may probably be found in the necessary physiological connection that exists between them and the production of those vocal sounds by which individuals (whether men or animals) can communicate their feelings and wishes to one another.

We shall complete the subject in so far as human physiology is concerned, by noting (1) the greatest quantity of air that can be expelled by a forcible expiration; (2) the total quantity that passes through the lungs in a given time; (3) the effects of respiration on the air; and (4) the effects of suspension or deficiency of respiration.

When the lungs have been emptied as much as possible of air by the most powerful expiratory effort, they still contain a quantity over which we have no control, and which may be estimated at about 40 cubic inches.* To this portion of the contents of the lungs the term *Residual Air* is applied. In addition to the residual air, physiologists distinguish, in connection with the respiratory process, *Supplemental Air*, which is that portion which remains in the chest after an ordinary gentle expiration, but which may be displaced at will; *Breathing or Tidal Air*, which is the volume that is displaced by the constant gentle inspiration and expiration; and *Complemental Air*, or the quantity which can be inhaled by the deepest possible inspiration, over and above that which is introduced in ordinary breathing. The greatest volume of air that can be expelled by the most powerful expiration, which is obviously the sum of the supplemental, breathing, and complemental air, is designated as the *Vital Capacity*—a term originally introduced by Dr. Hutchinson, the inventor of the spirometer, who found, from nearly 5000 observations, that of all the elements or factors which might be supposed to influence it, *height* alone stood in a definite and constant relation to it, this relation being expressed by the rule, that, 'for every inch of stature from 5 to 6 feet, 8 additional cubic inches of air (at 60° Fahr.) are given out by a forced expiration after a full inspiration.'

Thus, the vital capacity for a man from 5 feet to 5 feet 1 inch being 174 cubic inches, that for a man from 5 feet 1 inch to 5 feet 2 inches is 182 cubic inches; and so on. With regard to bodily weight as a factor, Dr. Hutchinson found, that 'when the man exceeds the average weight (at each height) by 7 per cent., the vital capacity decreases 1 cubic inch per pound for the next 35 lbs. above this weight.' Age and muscular development do not influence the result so much as might have been expected. It has been not unfrequently observed that the vital capacity is small in athletic men, and that it has been in excess in persons by no means remarkable for physical power. The *maximum* vital capacity met with by Dr. Hutchinson was 464 cubic inches; this was in a man 7 feet high, whose weight was 308 lbs.: the *minimum* was 46 cubic inches, and occurred in the case of a dwarf whose height was only 29 inches, and who weighed 40 lbs.

In estimating the effects of the respiratory process upon the air which passes through the lungs, we shall adopt the data afforded by the recent observations by Dr. Edward Smith, who has arranged a spirometer by which the quantity of air inspired may be registered from 1 to 100,000 cubic inches, and therefore for any period. This instrument, says Dr. Carpenter (to whom Dr. Smith has communicated many of the following statements for insertion in the new edition of his *Human Physiology*), 'he has used for 24 hours without intermission, except for meals, and he has ascertained the quantity of air inspired during sleep and in almost every condition met with during the day. From numerous experiments upon several persons, each extending over a whole day, he found that the average depth of inspiration was 33·6 cubic inches when at rest; and when walking at 1, 2, 3, and 4 miles an hour, 52, 60, 75, and 91 cubic inches, and even 107 cubic inches when working the treadmill.

'If we take 30 or 40 cubic inches as the average quantity exchanged at each respiration, we cannot but observe how small a proportion it bears to the entire amount which the lungs usually contain, for the "residual air" which cannot be expelled is estimated by Dr. Hutchinson at from 75 to 100 cubic inches; and the "supplemental air," which can only be expelled by a forced expiration, is about as much more; the sum of the two being from 150 to 200 cubic inches, or from 5 to 7 times the "breathing volume." Now, it is obvious that if no provision existed for mingling the air inspired with the air already occupying the lungs, the former would penetrate no further than the larger air-passages, and as

this would be again thrown out at the next expiration, the bulk of the air contained in the lungs would remain altogether without renewal, and the expired air would not be found to have undergone any change. The law of the *Diffusion of Gases* (q. v.) here comes in play, for the air in the air-cells and finer tubes being charged by the respiratory process with a great excess of carbonic acid, as compared with the inspired air contained in the larger tubes, a diffusion of the carbonic acid necessarily takes place in the outward direction, while the oxygen from the air, or the air itself, similarly diffuses itself in an opposite direction, towards and into the air-cells themselves.

The *total amount* of air which passes through the lungs in 24 hours must obviously vary with the extent and frequency of the respiratory movements. Dr. Smith found that during the day (6 A.M. to 12 P.M.), the average quantity of air inspired by several persons at rest was 502 cubic inches per minute, or a total of 542,160 cubic inches; and as the average quantity during the night was about 400 inches per minute, the total daily amount was 686,000 cubic inches. This quantity is largely increased by exertion, and Dr. Smith computes that the total amount actually respired by the unoccupied gentleman, the ordinary tradesman, and the hard-working laborer, would be 804,780, 1,065,840, and 1,568,890 cubic inches respectively.

The *alterations* in the inspired air effected by respiration consist essentially in the removal of a portion of the oxygen, and its replacement by a nearly corresponding bulk of carbonic acid. The amount of carbonic acid in the expired air varies inversely with the number of respirations; it reaches 5·5 per cent. (or more) when the respirations are only 6 in the minute, while it falls as low as about 2·6 per cent. when the respirations are 96 in the minute.

About 4·35 per cent. of carbonic acid is, on an average, added to the air in ordinary respiration; whilst about 4·782 per cent. of oxygen is removed; the actual diminution of bulk of the expired air (after the removal of the moisture obtained from the lungs) being about $\frac{1}{14}$ th of its volume. Hence, unless where there is free ventilation, the air in an apartment containing men or animals must soon become vitiated by containing a great excess of carbonic acid (for ordinary atmospheric air only contains about one part of carbonic acid in 2500 parts), and a deficiency of oxygen. The absolute quantity of carbonic acid (and consequently of carbon) exhaled in 24 hours is liable to great variations, caused by the temperature and moisture of the air, age, sex, muscular development, the nature and quantity of the food, muscular exercise, sleep, state of health, &c. Dr. Smith calculates that an adult man in a state of rest exhales in 24 hours an amount of carbonic acid equivalent to 7·144 oz. of carbon; and he estimates that it should be increased to 8·68 and 11·7 oz. for the non-laboring and laborious classes respectively, at their ordinary rate of exertion.

We may add, that the total amount of carbonic acid is greatly increased by external cold, and diminished by heat; that it is increased by a moist, and diminished by a dry atmosphere; that it increases in both sexes to about the 30th year, when it remains stationary for 15 years, after which it diminishes; that at all ages beyond 8 years it is greater in males than in females, and that it increases during pregnancy; that it is greater in robust than in slender men, the quantity of carbon expired per diem to each 1 lb. of bodily weight being (according to Smith) 17·07, 17·51, and 17·99 grains at 45, 39, and 33 years of age respectively; that it is greatly increased by eating (see *MUSCULAR FORCE*), and is diminished by fasting; that it is increased by muscular exertion (Smith found that when walking three miles an hour he excreted 2·6 more carbonic acid than when at rest; while tread-wheel labor occasioned about double the exertion that was caused by walking; that it is diminished by sleep; and that it is increased in the exanthematous fevers (measels, small-pox, scarlatina, &c.), and in chlorosis; while it is diminished in typhus and in chronic diseases of the respiratory organs.

There has been much discussion with regard to the extent to which the nitrogen of the air is affected by respiration. Usually a small amount of this gas is given off, but the quantities absorbed and exhaled so nearly balance each other, that its special action on the organism must be very trifling, further than as being a diluter of the oxygen, which would be too stimulating if breathed in a pure state. We therefore proceed to the consideration of the watery vapor with which the exhaled air is saturated. The amount of this fluid exhaled in 24 hours may range from about 6 to 27 oz., its usual range being between 7 and 11 oz. It is not pure water, but holds in solution a considerable amount of carbonic acid and all albuminous substance in a state of decomposition, which, on exposing the fluid to an elevated temperature, occasions a very evident putrid odor.

For the disease of the lungs and other respiratory organs, see the articles PNEUMONIA, PLEURISY, BRONCHITIS, CONSUMPTION, TUBERCLE; also INFLAMMATION, CONGESTION, HEMATOP-TYSIS, &c.

* According to Hutchinson, as will be presently seen, this estimate is far too small.

RESPIRATION, ARTIFICIAL, is required in all cases of suspended animation, from drowning, noxious gases, chloroform, &c. It may be performed either by forcing air into the lungs by means of a pipe passed through the mouth or the nostril into the glottis, or (which is usually preferable) by imitating the natural expansion of the chest by muscular effort, as by the methods invented by the late Dr. Marshall Hall and by Dr. Sylvester.

The best mode of forcing air into the lungs is by the use of a small pair of bellows, with the nozzle inserted in one of the patient's nostrils. The air should be driven into the lungs with extreme gentleness, the larynx being pressed backwards against the spine, so that the air may not go into the œsophagus and stomach. Gentle but firm pressure must be then applied to the chest to expel the introduced air, and fresh air again driven in; and this process of introducing and expelling the air alternately must be continued until either natural respiratory efforts appear, or the case becomes hopeless.

In the article **ASPHYXIA**, it is stated that one of the best methods of filling the lungs of an asphyxiated person with fresh air, is that of Dr. Marshall Hall. Dr. Sylvester's method (*The True Physiological Method of Restoring Persons apparently Drowned or Dead, and of Resuscitating Still-born Children*; London, 1859) is, however, generally regarded as decidedly preferable to that of Dr. Marshall Hall, although the same in principle. The following are Dr. Sylvester's rules, as slightly modified by a committee, whose investigations will be presently noticed. The patient is laid on his back on a plane, inclined a little from the feet up-

Fig. 1.

wards; the shoulders are gently raised by a firm cushion being placed under them; the tongue is brought forward, so as to project a little from the side of the mouth. The operator then grasps the patient's arms just above the elbows, and raises them

Fig. 2.

till they nearly meet above the head. This action imitates inspiration. The patient's arms are then turned down, and firmly pressed for a moment against the sides of the chest. A deep expiration is thus imitated; and these two sets of movements should be perseveringly continued at the rate of about 15 times in a minute.

Special reference must be made to two important documents among the publications on this subject. The first of these is the *Reports of the Scientific Committee on Suspended Animation*, presented to the Royal Medical and Chirurgical Society of London in July 1862; and when it is stated that this Report was signed by 'C. J. B. Williams, Chairman, W. S. Kirkes, George Harley, J. B. Sanderson, C. E. Brown Sequard, H. Hyde Salter, E. H. Sieveking, and W. S. Savory, Honorary Secretary,' its scientific claims to our attention are undeniable. The following are their suggestions in relation to treatment: 1. That all obstruction to the passage of air to and from the lungs be at once, so far as is practicable, removed; that the mouth and nostrils, e.g. be cleansed from all foreign matters or adherent mucus. 2. That in the absence of natural respiration, artificial respiration by Dr. Sylvester's method (as already described) should be employed. 3. That if no natural respiratory efforts supervene, a dash of hot water (120° Fah.) or cold water be employed, for the purpose of exciting respiratory efforts. 4. That the temperature of the body be maintained by friction, warm blankets, the warm bath, &c. [Whether the warm bath is serviceable or positively hurtful is, however, still an open question]; and 5. That in the case of drowning, in addition to the foregoing suggestions, the following plan may, in the first instance, be practiced: Place the body

with the face downwards, and hanging a little over the edge of a table, shutter, or board, raised at an angle of about 80°, so that the head may be lower than the feet. Open the mouth, and draw the tongue forward. Keep the body in this posture for a few seconds, or a little longer if fluid escapes. The escape of fluid may be assisted by pressing once or twice upon the back.

The other document to which we referred is entitled *Instructions for the Restoration of the apparently Dead from Drowning*, and was issued in 1864 by 'The National Lifeboat Institution.' In these *Instructions* (a copy of which should be in the possession of every family), it is recommended, that if breathing cannot be excited by the application of stimulants to the nostrils, or by dashing water on the face, Marshall Hall's method should be tried; and that if this do not prove successful in from two to five minutes, Dr. Sylvester's method should be resorted to.

In conclusion, a reference must also be made to the *Reports of the Scientific Committee* [of the members of the Royal Medical and Chirurgical Society] on the *Uses and Effects of Chloroform*. The committee decide that the most certain means of restoring life after poisoning with anæsthetics is by artificial respiration. 'By this means, resuscitating may generally be accomplished after natural respiration has ceased, provided the heart continue to act; and it may sometimes be effected even after the cessation of the heart's action. Galvanism resuscitates within the same limits as artificial respiration; it is, however, far less to be relied on in equal cases. Galvanism may be used in addition to artificial respiration; but the latter is on no account to be delayed or suspended, in order that galvanism may be tried.'—*Proceedings of the Royal Medical and Chirurgical Society*, vol. iv.

RE'SPIRATOR, is the name given by its inventor, Mr. Jeffreys, to an instrument which gives warmth to the air drawn into the lungs in breathing. It is attached to the mouth, and is composed of several layers of very fine wire, fixed so near together, that the exhaled air passing through them is diffused over a very large amount of surface, its warmth being absorbed by the metal, which, being an excellent conductor of heat, freely returns it to the cold air, drawn in through it in the act of respiration. Mr. Jeffreys considers it necessary that about twenty layers of metal-work should be used, and in order to make the instrument as light and compact as possible, each layer must be extremely thin. The apparatus usually consists of from eight to twelve frames of sheet-silver or other metal, about $3\frac{1}{2}$ inches long, $1\frac{1}{2}$ inch wide, and $\frac{1}{100}$ th of an inch thick, the metal of which is pierced away by machinery so as to leave only a narrow framework, consisting of six vertical bars $\frac{1}{16}$ th of an inch wide, and five horizontal bars, with a width of $\frac{1}{16}$ th of an inch thick. To each side of each of these frames is soldered a layer of wires $1\frac{1}{2}$ inch long, and $\frac{1}{16}$ th of an inch thick. These wires are laid at about $\frac{1}{16}$ th of an inch apart, and are so numerous, that a large respirator of high power contains 2000 feet of wire, divided into about 12,000 pieces, and soldered to the frames at more than 80,000 points.

The frames, of wire-work, are fixed parallel to each other, and kept a small distance apart by small knots of a bad conductor of heat, so that the inner layer is always kept at almost the temperature of the expired air, and each successive layer diminishes in warmth, till the outer one is nearly as cold as the external air. By this arrangement, the air that is inhaled meeting with layers of wire of gradually increasing heat, is raised in the most powerful respirators to the highest attainable temperature. Such respirators have twenty-four layers of wire-work, those of medium power sixteen, and the weakest eight. The whole of the wire-work is curved, so as to fit closely to the face, and is enclosed in a border or case of soft leather; and an outer coat, usually of a very fine and open woollen fabric, is added. The form of instrument chiefly used is fixed over the mouth, and is named *The Oral Respirator*. For an instrument to cover both the mouth and nostrils, the term *Orinasal Respirator* is used. The use of these instruments in allowing persons with delicate lungs to take out-of-door exercise with safety and advantage in comparatively severe weather, is now universally recognized. Tyndall invented a *Smoke Respirator* for firemen; there are respirators for keeping out dust and metal-filings from the lungs of factory operatives; and respirators containing a sponge soaked with creosote or carbolic acid for excluding or destroying bacteria germs.

RESPIRATORY SOUNDS, are of the greatest importance in the diagnosis of the diseases of the lungs. They may be divided into (1) those directly resulting from inspiration and expiration, and (2) those of the voice, including coughing.

In the healthy state of the lungs, two distinct sounds are heard, on applying the ear, either directly or through the intervention of the stethoscope, to the walls of the chest—one called the *vesicular sound*, because it is supposed to be caused by the passage of the air from the ultimate tubes into the air-cells or vesicles; and the other the *bronchial sound*, because it is generated in the bronchial tubes by the air moving through them.

The vesicular sound, known also as the *respiratory murmur*, is

mainly produced during inspiration, being very faint, and sometimes scarcely perceptible during expiration. It is rather a rustle than a murmur, and has been compared to the signing of a gentle breeze amongst leaves, to the sound made in the deep inspiration of a sleepy person, &c.; but a single minute's application of the ear to the chest of a healthy person below the collar-bone, will give a clearer idea of its true nature than any mere description could convey. The sound is more distinct in thin than in fat persons, in women than in men, and in children than in adults. Indeed, it is so loud in children, that when an unusually noisy sound is heard in an adult, it is said to be *puerile*. The *bronchial sound* has a blowing character, such as may be produced by blowing air quickly through a tube, and it is altogether distinct from the former. It may be mostly clearly heard over the trachea or windpipe, and at the upper part of the sternum or breast-bone.

Such are the sounds as they occur in the healthy lungs. In disease, any change which tends to impair the respiratory function in one part of the lungs, will make the vesicular murmur abnormally weak there, and abnormally louder in the remainder; and there are other changes, besides a mere increase or decrease of intensity, that sometimes occur, and into which we have no space to enter. The bronchial sound is also liable to morbid alteration; for example, it may be heard in parts of the chest where it is usually inaudible, in consequence of condensation of the surrounding pulmonary tissue, or from dilation of the tubes, independently of condensation; and in violent dyspnoea, it may sometimes be heard over the whole chest without any change of structure. These morbid sounds are only modifications of those which occur in health. There are, however, other sounds generated by disease which are highly important in diagnosis. These are termed *Râles* by the French, and *Rattles*, *Sibilus*, *Rhœchus*, &c., by those English writers who do not adopt the French term. They may be briefly divided into the *dry* and the *moist râles*, the former being caused by the passage of the air, with increased rapidity, through narrow portions of the bronchial tubes; while the latter are formed by the passage of air through a fluid of more or less tenacity in the bronchial tubes, causing the formation of a succession of bubbles, whose bursting occasions the sound.

There are two other morbid sounds connected with the respiratory system which deserve to be named in this list, viz., *metallic tinkling* and the *friction sound*. Metallic tinkling is a quick and sharp sound, resembling that produced by striking a glass vessel with a pin. Its occurrence affords evidence of the existence of a cavity of considerable size, containing air, and surrounded by firm walls; but how the sound is produced is not definitely settled. The friction sound is produced by the rubbing together of the pulmonary and costa pleurae when rough from inflammatory action, and is indicative of pleurisy.

RESPO'ND, in Gothic Architecture, a half-pier attached to a wall, and supporting an arch, &c.

RESPO'NDENT is the name of the party against whom another party presents a petition to a court which requires to be answered. The word is used in Scotland as well as in England, but more frequently in England.

RESPONDENTIA is a mode of raising money by a master of the ship in critical and desperate circumstances, when he has no other means of doing so, and when the object is to rescue or save the ship and cargo for the benefit of all parties. He goes to a person who advances a sum of money, and takes a mortgage of the goods or cargo, but in such a way that if the goods never arrive, the creditor loses his whole security, and cannot claim repayment from the owner of the ship. When money is borrowed in a similar way on the security of the ship itself, it is called *Bottoury* (q. v.). In both cases the security is in the form of a bond.

RESPON'SORIES (Lat. *responsorium*, a response), short sentences, generally verses or portions of verses from Scripture, which are assigned in the church services, to be answered by the people to the officiating clergyman. Responsories are appended to lessons, to chapters, and to versicles, in common with which they are either chanted or simply repeated, according to the nature of the service. They are found in all the ancient liturgies, and occur also in the Book of Common Prayer. In the latter the name given to them is **RESPONSE**; but in the ancient service-books, as well as in the modern Breviary, they are called as above.

REST, in Heraldry, the name usually given to a charge of the form indicated in the subjoined figure, varying, however, considerably in different representations. It appears at too early a date to be what it is often said to be—a spear-rest. It is sometimes called an organ-rest, and in old rolls, a clarion—and is most likely a representation of some musical instrument like the Pandean pipe. It was a rebus-badger of the Clares.

REST, in Music, an interval of silence occurring in the course of a movement between one sound and another. The duration of a rest, like the duration of a note, is indicated by the form of the character representing it.

For rests of a still longer duration, it is now usual to draw one or two oblique lines across the staff, and write on them in figures the number of measures during which the voice or instrument is to be silent. A rest, like a note, may be prolonged by one or more dots.

REST-HARROW (*Ononis*), a genus of plants in the natural order *Leguminosæ*, suborder *Papilionaceæ*, having a 5-cleft, bell-shaped calyx, the standard of the corolla large and striated, the keel beaked, the pod turgid and few-seeded. There are many species, chiefly natives of Europe, and generally herbaceous or half-shrubby.—The **COMMON R.** (*O. arvensis*) is abundant in pastures and by waysides in Britain. Its lower leaves have three leaflets, the upper are simple; the flowers are axillary and rose-colored, or occasionally white. The plant is half-shrubby, with somewhat spiny stems; viscid; and its smell strong and unpleasant. The roots are tough and woody, whence its English name. It is sometime a troublesome weed, but only in neglected pastures, and disappears before careful cultivation.

RESTIA'CEÆ, a natural order of endogenous plants, nearly allied to *Cyperaceæ*, mostly natives of the southern hemisphere, and abounding at the Cape of Good Hope and in Australia. They are herbaceous plants, or sometimes half-shrubby, have simple stems, and narrow leaves; and are hard, wiry, and rush-like. They have generally a creeping root-stock. The flowers are in heads or spikes, generally unisexual, with 2–6 glumes, sometimes with none, two or three stamens, an ovary with 1–3 cells, one ovule in each cell, the fruit a capsule or nut. *Restio tectorum* is much used for thatching houses at the Cape of Good Hope. *Wildenowia teres* is used for making baskets and brooms.

RESTIGOUCHE, a river in the north-west of New-Brunswick, Canada, forms for about 50 miles the boundary between that province and the province of Quebec. It is 200 miles in length, and falls into Chaleur Bay, which opens into the Gulf of St. Lawrence. For the last 18 miles it is navigable for the largest ships.

RESTITUTION, in Scotch Law, is the obligation of the purchaser of a movable, which really belongs to a third party, to deliver it up to such real owner without claiming repayment of price. An action lies to recover restitution of money paid in mistake. See **REPETITION**.—In English Law, the word restitution is used in similar circumstances to denote delivery up of possession to the rightful owner. Thus, in case of goods stolen, the criminal court may order restitution of the goods to the owner.

RESTORA'TION, a term applied, in English history, to the resumption of monarchical government, on the accession of Charles II., May 29, 1660, after an interval of eleven years, from 30th January 1649, when Charles I. was beheaded, during which the government of Great Britain was republican. The Restoration was appointed by various statutes to be observed as a festival in the Church of England, with special religious services; but its observance was abolished in 1859 by act 23 Vict. c. 8.

RESTORA'TIONISTS, a sect which, under a new name, has revived a very ancient doctrine, which has found advocates at all times since the days of Origen (q. v.). One of the most remarkable doctrines of that Father was his belief of a general *apokatastasis*, or 'restoration' of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men, however wicked, and all the evil angels, even Lucifer himself, would be restored to the favor of God, and reunited to Him in heaven. This doctrine was condemned at the time, and has since been repeatedly rejected by the churches of the East as well as of the West. The doctrine has been renewed in more than one form since the Reformation by various classes, who have taken the name of Universalists (q. v.). The particular title of R. was given in America to the followers of a preacher named Ballow, who, in addition to the tenet above explained, held that all retribution is confined to this life, and who, although he denied the immortality of the soul, yet taught that at the resurrection all men will be admitted to everlasting happiness. The R. are said to exist chiefly in Massachusetts.

RESURRECTION. This expression denotes the revival of the human body in a future state after it has been consigned to the grave. We find traces of this doctrine in other religions, and especially in later Judaism, but the doctrine is peculiarly Christian. In the earlier Hebrew Scriptures, there is no mention of it. It is not to be found in the Pentateuch, in the Psalms, nor even in the earlier prophecies. It is supposed to be alluded to in Isaiah (xxvi. 19), and in Ezekiel (xxxvii.) in the well-known chapter as to the revival of dry bones in the valley of vision; and in the last chapter of Daniel (xii. 2), there is the distinct affirmation that 'many that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt.' There is also a well-known passage in Job (xix. 25–27) which has been thought by some to refer to the doctrine of the resurrection of the body. Almost all recent criticism, however, denies

the validity of this reference, as unsupported by a correct rendering of the words themselves; and especially by the whole scope of the argument of the book, which confines its view of retribution to the present life. The idea of a future resurrection would have presented to the mind of the patriarch a more conspicuous solution of the enigmas of Providence which perplexed him, and could not have failed to be introduced into the argument by some of the speakers, had it formed an element of their religious knowledge; but they nowhere allude to it. It is only, therefore, in the later Judaism that the doctrine appears. In the time of our Lord, it had become a formal doctrine of the Pharisees. The general body of the Jewish people seem also to have believed in it. The Sadducees alone disputed it (Matt. xxii. 23, sq.; Luke xx. 27, sq.; Acts xxiii. 6—8). It appears, in fact, to have become bound up in the Jewish mind with the idea of a future life, so that an argument which proved the one proved the other; and the Sadducees not merely denied the distinctive idea of the resurrection, but further denied that there was any 'angel or spirit.'

It remained for Christ and his apostles to reveal clearly the doctrine of the resurrection of the body, and to connect it with the fact of Christ's own resurrection as its special evidence and pledge. The following may be stated as the main points involved in the doctrine as revealed in the New Testament: 1. The resurrection of the dead is ascribed to Christ himself; it will complete his work of redemption for the human race (John v. 21; 1 Cor. xv. 22, sq.; 1 Thess. iv. 14; Rev. i. 18). 2. All the dead will be raised indiscriminately to receive judgment according to their works, 'they that have done good, unto the resurrection of life; and they that have done evil, unto the resurrection of damnation' (John v. 51—29; 1 Cor. xv. 23; Rev. xx. 11). 3. The resurrection will take place at 'the last day,' by which seems to be meant the close of the present world (John vi. 39, 40, xi. 24; 1 Thess. iv. 15). 4. The great event is represented as being ushered in by the sound of a trumpet, a representation probably borrowed from the Jewish practice of convening assemblies by sound of trumpet (1 Cor. xv. 52; 1 Thess. iv. 16). 5. As to the character of the change through which our bodies are raised after the lapse of ages, and get their identity preserved, there is nothing distinctly made known. The impossibility of such a change was evidently a subject of argument in the primitive Christian age, and the apostle argues strongly in its favor (1 Cor. xv. 32, sq.) from occurrences which are scarcely less mysterious in the natural world. It is not professed, however, that such occurrences really explain or throw light upon the fact of the resurrection. The apostle designs rather to silence cavils, and to invigorate faith, than to render an account of the actual manner of the resurrection.

Arguing from God's infinite power as displayed in the processes of creation, he would, as it were, press the question which he asks elsewhere: 'Why should it be thought a thing incredible with you that God should raise the dead?' (Acts xxvi. 8), rather than attempt any explanation of which the subject does not really admit. And this is the only becoming spirit in which this great doctrine can be contemplated by any mind. The fact of a resurrection of the dead is clearly revealed; but the mode of the fact necessarily transcends our present intelligence.

RETAINER is, in English Law, the act of engaging an attorney or counsel to attend to a certain suit or case. The retainer of an attorney may be either verbal or in writing; but the retainer of a counsel is always by writing; i.e., by a written memorandum delivered by the attorney to the counsel. The retaining of a counsel is generally a precautionary measure resorted to only in the case of eminent counsel, the effect of it being to prevent the other party from securing the services of such counsel; and this is considered a prudent precaution in most cases of importance. The usual fee, however, must be paid over and above the retaining fee, which is a small fee varying with the court in which the litigation arises.

RETAINING WALLS. These, as their name implies, are walls built to retain earth, sand, or other incoherent substances in positions and forms which without their aid they could not maintain.

These substances, if left to themselves, will not stand with vertical sides, but will fall down till they assume a certain slope. The angle which this slope makes with the horizontal is called the 'angle of repose.' This angle varies according to the nature of the material; for example, that of moist soil is about 45°, while fine sand assumes an angle of about 30°.

In fig. 1, E represents a section of a mass of earth, which it is desired to retain by means of the wall ABCD.

If we draw BG from B at the angle of repose, it is evident, from what has been said, that the prism ABG is kept in position by means of the retaining wall; and if the earth began to give way, it would do so by slipping on some line, BF. The wedge-shaped piece, ABF, which has the greatest tendency to separate itself from the rest of the mass, is called the 'prism of greatest pressure;' and the retaining wall ABCD must be made of suffi-

cient weight and thickness to prop it up and resist its tendency to slide. The line BF is found to bisect the angle ABG.

In estimating the requisite thickness of the wall, it must be taken into account that the wall may give way in various manners; it may be overturned, or it may slide as a whole along its base DB, or the upper parts may give way, while the base remains.

From these data, mathematical formulæ have been worked out, which determine the thickness requisite for different situations and materials, such as that given by M. Poncelet for ordinary materials, and within ordinary limits:

$$x = .285(H + h).$$

Where H, the height of the wall, and h, the additional height of the bank above the top of the wall, being given, x, the thickness of the wall, can be found.

Fig. 1.

Fig. 2.

These formulæ, however, are not of much practical value, on account of the varying nature of the data on which they are founded, and of the excess of strength requisite in all such constructions, to allow for causes of failure, which cannot be foreseen or provided for in the calculations. Practical experience is found to be the only safe guide in all such considerations.

Figs. 2, 3, and 4 represent sections of forms of retaining walls in common use. Figs. 2 and 3 are used in retaining earth-works, while fig. 4 is a common form of dock-wall.

Fig. 3.

Fig. 4.

In that shown by fig. 2, the thickness at the top is made from 2 to 3 feet; the back is vertical, and the front is sloped out 1 foot for every 8 feet in height; so that the thickness increases with the height, in the same manner as the pressure of the earth, which it is required to resist.

The foundation is made of large stones, extending beyond the sides of the wall, so as to distribute the pressure on as large a surface as possible. It is also sunk for 2 or 3 feet below the adjoining surface, so as to resist its tendency to slip on its base.

At its back are placed counterforts, C, which are built up with the wall, and are about 8 feet long by 2½ feet wide, placed from 8 to 10 feet apart. These counterforts stiffen the wall like ribs; they put its center of gravity further back, and so resist the tendency to heeling or overturning; they also act advantageously in dividing the earth, and so diminishing the length of the mass, which can act together against this wall. This form of wall is very simple in construction.

The form of wall shown in fig. 3 is that which requires the least material; it also, on account of its thinness, dries and consolidates rapidly, but is not so easily built as that shown in fig. 2.

The dock-wall shown in fig. 4 is made much heavier than the simple pressure of the earth behind it would require; for it has many strains to bear of an exceptional character due to its situation; such are the machinery and goods deposited on the quays, and the possible accident of the dock being suddenly emptied of water, while the earth behind the wall is full of water.

In the construction of a retaining wall, a great desideratum is, that the earth behind it be well drained; for if water be allowed to accumulate behind the wall, the earth gets into a semi-fluid state, in which it gives a very much increased pressure on the wall. For this purpose, holes are left through the wall called 'weeping-holes;' these holes are about 9 inches high and 2 inches wide, and are generally placed about 1 for every 36 square feet of wall.

Also stones without mortar are frequently built up behind the wall, so forming an open stratum, into which the water drains, and is thence carried off through the weeping-holes.

RETENTION OF URINE is the term employed in medicine to signify a want of power to discharge the urine from the bladder, and it must be carefully distinguished from a far more serious affection known as *suppression of urine*, in which also no urine is passed, because in this case there is none in the bladder.

Retention may arise either from change of structure of the parts concerned in the expulsion of the urine, or from mere disordered function unaccompanied by change. The former are termed *organic*, and the latter *functional* causes of retention.

Amongst the chief organic causes are: 1. Permanent stricture of the urethra (q. v.). 2. Contraction of the urethra, in consequence of a blow on the perinæum, or other external injury. 3. Tumors within the urethra. 4. Foreign bodies in the urethra, as calculi, clots of blood, or mucus, &c., which have entered it from the bladder, or fragments of bougies, &c., introduced from without. 5. Enlargement of the prostate gland, especially in aged men. The treatment in retention from these causes must be entirely left in the hands of the surgeon.

The principal functional causes are: 1. Spasm of the urethra, often termed spasmodic stricture; and 2. Want of power in the muscular coat of the bladder and urethra.

Spasm of the urethra is most likely to occur in those who have a slight permanent stricture, or a urethra irritable from other causes. The spasm usually follows exposure to cold or wet, but it may likewise be excited by piles or other sources of irritation in the lower bowel, or by the use of cantharides either taken internally as a medicine, or absorbed from blisters applied to the skin. The patient finds himself unable to pass his water, although he has a great desire and makes strong efforts to do so. The bladder soon becomes so distended that it can be felt as a tense round tumor above the pubes. If relief be not speedily afforded, the bladder may burst, and discharge its contents into the peritoneal cavity, in which case death rapidly ensues; or the urethra behind the stricture gives way, and the urine is extravasated into the cellular tissue of the adjacent parts—a condition which, if not promptly relieved by surgical interference, is likely to be followed by gangrene, typhoid symptoms, and death.

If the symptoms are not very severe, and there is no evidence of old permanent stricture, a hot bath, combined with the administration of the tincture of muriate of iron, in doses of ten minims, taken every ten minutes in thin gruel or in barley-water, will often give relief. Sometimes a full opiate administered by the mouth, or preferably as an enema, or the inhalation of a few whiffs of chloroform, will, by allaying the spasmodic action, give immediate relief. If these means fail, surgical assistance must be at once procured, and the bladder evacuated by a catheter—an operation often requiring very delicate manipulation. If these means fail, which only happens when the spasm is associated with old-standing diseases of the urethra, the surgeon must either puncture the bladder through the rectum, or above the pubes, or make an incision into the urethra either at or behind the seat of the stricture.

Paralysis of the muscular coat of the bladder may arise from the debility of old age, from the depressed state of the nervous system in fevers of the typhoid type, from injury or disease of the head or spine, and from various other causes. In a temporary form, it is often a result of over-distention of the bladder from stricture or prostatic disease, and it sometimes occurs in the case of nervous sedentary persons, if they have allowed rather more than the usual time to elapse without evacuating the bladder. It should be generally known that retention of urine from paralysis is sometimes accompanied with dribbling away of the water, so that the retention might at first sight be mistaken for incontinence of urine. On examination, however, it will be found that the bladder is abnormally distended, and cannot be evacuated by the act and will of the patient.

In these cases, the urine must for a time be regularly drawn away by the catheter. General tonics, such as the cold-bath (or sometimes preferably the sitz-bath) and chalybeates, must be given to improve the general health; while medicines which are supposed to act locally on the mucous coat of the bladder or on the spinal cord, must be simultaneously administered.

A peculiar form of retention sometimes occurs in women of hysterical temperament, in which the will rather than the power is at fault. The treatment should here be directed towards the general hysterical tendency, rather than to this special manifestation of it.

RET'FORD, EAST, a small municipal and parliamentary borough and market-town in the county of Notts, on the right bank of the Idle, an affluent of the Trent, 138 miles north-north-west of London by the Great Northern Railway. West R., on the other side of the river, and connected with East R. by a strong bridge of five arches, is a more modern and much smaller

town. Tanning and coachmaking are carried on to some extent. Pop. of municipal borough (1881), 9748; of parliamentary borough, which returns two members to parliament, and which includes several districts, 49,257; and in 1881, 50,081.

RETHEL, a town of France, in the department of Ardennes, prettily situated on the right bank of the Aisne. Woollen and other manufactures are carried on. Pop. (1876) 7364.

RET'IMO, a seaport town of the island of Crete, on its north coast, 35 miles west from Candia. The neighborhood is productive both of oil and wine. Pop. about 6000, of whom two-thirds are Turks, and the rest Greeks.

RE'TINA. See **EYE**.

RETIREMENT, ARMY AND NAVY. A Royal Warrant introducing and regulating compulsory retirement from the army was issued in 1877. Voluntary retirement on half-pay is allowed to officers after not less than 12 years' service. Officers below the rank of major, who have served in their present rank for seven years without promotion are to be placed on half-pay after a total service of 20 years; majors after 27 years, and higher officers after varying periods. As to age, a colonel who has not retired on other grounds, must, unless special exception be made, retire at the age of 63 years, lieutenant-colonel at 60 years, major at 58 years, and officers of lower rank at 55 years—the pension varying according to circumstances. In the navy, officers are placed on the retired list at 65 years of age if admirals or vice-admirals, 60 for rear-admirals, 55 for captains, 50 for commanders, and 45 for lieutenants, with the option in each case of retiring five years earlier. Lieutenants and commanders are also retired compulsorily if they have not served for five years, captains after seven years without service, and flag-officers after ten years. In 1881 there were 2048 naval and 239 marine officers on the retired list, costing £616,518. In the army, there were 360 officers on retired full-pay, costing £181,000, and 1518 on half-pay, costing £349,500; but these numbers include nearly all staff-officers, and many on temporary half-pay on account of sickness, private affairs, &c. See **PENSIONS**, **DISCHARGE**; also **SUPERANNUATION**.

RETO'RT, a vessel employed by chemists for the purpose of distilling or effecting decomposition by the aid of heat. It may be made of glass, earthenware, or metal, according to the purposes for which it is to be employed.

Glass retorts are the most common, and their ordinary form is seen in the figure. They may be employed for the production of such products as do not require any extraordinary degree of cold for the condensation of their vapor—as, for instance, for the production of hydrocyanic or nitric acid. The globular vessel in which the neck of the retort is inserted is from its function termed the *receiver*. Cold may be applied to the neck of the retort—for the purpose of condensing the vapor—in various ways, as by the application of a cold wet cloth, by a current of water, or by a special apparatus known as *Liebig's Condenser*.

In the accompanying figure a *Liebig Condenser* is fitted on to the

Liebig's Condenser.

retort. A is the bulb of the retort, into which the matter to be distilled is inserted. It can be opened or closed at will at the top by a ground-glass stopper. From the bulb the neck proceeds, and its termination is seen in the receiver D. The condenser, BB, embraces the greater part of the neck of the retort. It consists of a glass tube, tapering from end to end, fixed in the center of a metal pipe, provided with tubes, so arranged that a current of cold water may circulate through the apparatus. By putting a few pieces of ice into the little cistern, E, the temperature of this water may be kept at 32° and extremely volatile liquids condensed.

The retort may be heated in various ways—as by means of a lamp, or by placing its body in a sand-bath, or even in the fire; in the last case, the retort is usually protected by a coating of lute.

In ordinary cases requiring a higher temperature than glass could bear, earthen retorts are used; for the preparation of hydrofluoric acid, retorts of lead are employed; while for the preparation of strong sulphuric acid, platinum is the best material for the retort. Iron retorts are employed in the laboratory for the preparation of oxygen from black oxide of manganese and some other processes; and in gas-works, for the destructive distillation of coal.

RETREA'T, in Military Language, signifies a retrograde movement of a force, with the intention of avoiding an encounter with a hostile body in the front. The greatest exertion of talent is requisite in a general to conduct an able retreat, more depending on arrangement and coolness than even in the preliminaries of a battle. When the enemy pursue, if the retreat is not to degenerate into a rout, the retreating army must be covered by a powerful rear-guard, which from time to time must hold the pursuers at bay, while the artillery-train and baggage pass defiles, cross streams, and overcome other special obstacles. A strong retreat is made when the rear is formed by a line of solid battalions, of which alternate masses retreat, while those intervening face about and oppose the enemy; the latter afterwards retreating between and to the rear of those which retreated in the first instance. The retreat is thus continued by alternate halting and falling back on the part of each corps.

RETRENCHMENT, in Fortification, is a defensive work, comprising at least ditch and parapet within some other work of a fortress, and intended as a place of retreat for the defenders, whence they may prolong the defence, or capitulate after the faces of the work itself have fallen into the enemy's hands. The retrenchment bears a considerable resemblance to the *réduit*, except that it is almost always of earth. Retrenchments are made in ravelins, and the re-entering *places d'armes* at the time of constructing those works. A retrenchment is thrown across the gorge of a redan or bastion, or from shoulder to shoulder, when it is apprehended that the salient angle will fall into the possession of the besiegers; these retrenchments are usually made when wanted. Such a retrenchment across the interior of the Redan at Sebastopol caused the sanguinary repluse of the British on the 8th September, 1855.

RETRIEVER, a dog specially trained to go in quest of game which a sportsman has shot, and particularly useful in fatiguing ground or marshy places. The retriever is generally cross-bred,

Retriever.

the two recognized crosses being that between the Newfoundland and setter, which has the coat smooth and wavy, and that between the Newfoundland and water-spaniel, which has the coat curly. The favorite color is black. Spaniels, crosses of the terrier and spaniel, and terriers are also used as retrievers; and even fox-hounds, blood-hounds, and setters. The training requires much assiduity and patience, the dog being apt at first to be drawn from the proper quest by any water-rat or other creature that presents itself, and also to bite the game too hard, so as to injure it. A thoroughly trained R. therefore commands a high price, being of great use to the sportsman. A high degree of intelligence is requisite in a R.; it is very often the attached companion of its master, and an inmate of the mansion rather than of the kennel.

RETROGRADE. This is a term applied to the motion of the planets and comets among the fixed stars, when they appear to move in the *reverse* order of the signs of the Zodiac (q. v.). All the planets move in the same direction round the sun, and therefore their retrograde motions must be due to their motion relative to the earth. In the case of comets, however, we have instances of motion about the sun in the opposite direction to that of the

planets, and in such orbits the motion (referred now to the sun, not to the earth) is said to be retrograde.

In the case of planets, which is thus the only one we need consider, let S be the sun, and let the two circles represent the orbits of two planets. First, let the planets be, as at P and Q, towards the same side of the sun. The inferior planet has of course the greater velocity; and therefore, if *p* and *q* represent their positions after a lapse of a given time (second, hour, day, &c.), *Pp* is greater than *Qq*, and therefore the *direction* of the line *pq* (in which

one is seen from the other) has rotated in the *opposite* direction to that in which either planet revolves about the sun. Hence, when a superior planet is in opposition (i. e., if Q be Jupiter, and P the earth), it *appears* to move backward among the stars. When an inferior planet is between the earth and sun (i. e., if Q be the earth, and P Venus), it *appears* to move backward also. If the planets be on opposite sides of the sun, as at P and R in the figure, let *p* and *r* be their positions after a given time; then *pr* has turned from the direction PR in the direction in which the planets revolve about the sun. Hence any planet, superior or inferior, appears to move *directly* when the sun is between it and the earth. Between these two opposite cases, there must, of course, be points at which the apparent motion is neither retrograde nor direct—then the planet is said to be *stationary*. This case occurs whenever, for an instant, the lines PQ and *pq* are parallel; that is, when the two planets are moving with equal velocities transverse to the line joining them, these velocities being parallel, and towards the same side of the joining line.

RETZSCH, **FRIEDRICH AUGUST MORITZ**, an eminent German painter and engraver, was born in Dresden, 9th December 1779, studied at the academy of his native city, where he became a professor in 1824. R. died 11th July 1857. He has acquired great celebrity by his illustrations in outline of the great German poets, Schiller, Goethe, &c.—those of Goethe's *Faust* being particularly well known, not only in his own country, but also in France and England. His illustrations of Fouqué's charming romances, *Undine* and *Sintram*, are singularly beautiful. R. likewise executed several fine works, the subjects of which are taken from the classical mythology, as 'The Child Bacchus asleep on a Panther,' 'Diana,' 'Love and Psyche embracing in the Clouds,' 'A Satyr and Nymph,' 'The Four Epochs of Human Life,' &c. Among his other works of conspicuous merit are—'The Struggle of Light and Darkness,' 'The Chess-players,' and 'Fantasies.' R. ranks as one of the most original, thoughtful, and vigorous artists of modern Germany. His works display the presence of a strong, inventive, and cultured imagination, whose efforts at expression never degenerated into a weak sentimentalism. As a miniature oil-painter, R. was also very successful.

REUCHLIN, **JOHANN**, also known by his Græcized name of *Capnio*, one of the first and most active promoters of Hebrew studies in Germany, whose labors and struggles in no small degree helped to bring about the Reformation, was born at Pforzheim in Baden, 28th December 1455. He received his earliest education at Schlettstadt, and in 1473, was appointed traveling companion to Prince Friedrich of Baden, in which capacity he visited Paris, made the acquaintance of the celebrated Wessel (q. v.), and studied Greek under Hermonymus of Sparta, besides assiduously practising the composition of Latin. Two years later, R. went to Basel, where he continued his study of Greek, and wrote his Latin dictionary, *Vocabularius Latinus Brevislogus* (Dietus) (Basel, 1478). In the same year he paid a second visit to France, studied law at Orleans (1479), and fought at Poitiers (1480), then returned to Germany, married, and set up at Tübingen as a teacher of jurisprudence and literature. Subsequently, he was raised to the rank of a count of the German empire in 1492, and about the same time began the study of Hebrew under a learned Jew, Jacob Jehiel Loans, the imperial physician. In 1496, R. went to Heidelberg, where he wrote a satirical comedy entitled *Sergius, sine Capitis Caput*, directed against the unworthy Augustinian monk Holzinger, who had been made chancellor of Würtemberg. In 1498, he was sent to Rome by Philip the Elector-palatine, and delivered a Latin oration before the pope.

While remaining there, he applied himself more vigorously than ever to the study of Hebrew and Greek, and with such success, that his Greek master, Argyropoulos, exclaimed in wonderment at his proficiency: 'Our persecuted Greece has taken refuge beyond the Alps.' R. returned to Württemberg in 1499.

In 1506 appeared his *Rudimenta Lingue Hebraice*, a work of which he was justly proud. He made it, as he said in his preface, 'without any foreign help,' declares it to be 'the first attempt to execute a grammar of the Hebrew tongue,' and finishes with the Horatian boast, *Ævægi monumentum ære perennius*. His Hebraic studies, which embraced the post-biblical Jewish literature, were—in their consequences—the most important of his life, drawing him into bitter strife with learned Jews, Jewish proselytes, and the Dominicans, and directly and powerfully helping on the Reformation. It was in the year 1510 that the struggle between Light and Darkness, as the Germans regard it, broke out. In that year, Johann Pfefferkorn, a Jewish proselyte, in the true spirit of a renegade, called upon princes and subjects to persecute the religion of his fathers, and especially urged the emperor to burn or confiscate all Jewish books except the Bible. R. remonstrated, maintaining that no Jewish books should be destroyed except those directly written against Christianity. This tolerant attitude drew upon R. the enmity of the Dominicans, and particularly the inquisitor, Jakob van Hoogstraten. These enemies of R. held possession of the universities of Paris, Louvain, Erfurt, and Mainz; but all the distinguished and independent thinkers in Germany, were on the side of the brave and humane scholar. Among the *Reuchlinists*, as they were termed, we may especially mention the names of Ulrich von Hutten (q. v.) and Franz von Sickingen (q. v.), to the first of whom (in conjunction with Rubeanus, &c.), we owe the *Epistola Obscurorum Virorum* (q. v.), and to the second of whom R. owed his safety, for he threatened (1519) Hoogstraten and his monks with his most terrible vengeance if they did not cease to persecute 'his teacher, Doctor Reuchlin, that wise, experienced, pious, and ingenious man.'

When the Reformation was inaugurated by the burning of the papal bull (1517), R. instinctively felt that a crisis had come, and exulted in the heroism of Luther. 'God be praised!' he said: 'we have now got a man who will give them [the monks] mighty hard work.' Luther, in a letter to R. (1518), tells the latter that he had longed to take part with him in his noble struggle, but had never found an opportunity. But the end of the scholar's troubles was not yet come. A quarrel broke out between Ulrich Duke of Württemberg and the Swabian League, in the course of which R. became a prisoner of Duke Wilhelm of Bavaria, who, however, generously restored him his freedom, and in 1520, appointed him professor at the university of Ingolstadt. While there, he received a call to Württemberg, which he declined, but sent Philip Melancthon in his stead. In 1522 the plague broke out at Ingolstadt, and R. again withdrew to Tübingen, intending to devote himself exclusively to learned studies, but soon after he fell sick, and died at Stuttgart on the 30th of June. R.'s life has been written by Gehres (1815), Meyerhoff (Berl. 1830), and Geiger (Leipzig. 1871).

REUNION, ILE DE LA, the name officially used after the French Revolution of 1789 and since that of 1848 for the island described at BOURBON, ILE DE. The latter name was used before 1789 and from 1814 to 1848; while *Ile de Bonaparte* was the name from 1809 to 1814.

REUS, a manufacturing town of Spain in the province of Tarragona. It is only about 5 miles from the seaport of Salou. The modern portion of R. consists of wide plazas and streets. The prosperity of R. dates from about the year 1750, when a number of English merchants settled there. R. contains 80 establishments for cotton-spinning alone, 5000 looms, and many silk-ribbon factories, and manufactures soap, brandy, casks, and machinery. Pop. 28,000.

REUSS, the name of two sovereign principalities of Germany, between the kingdom of Saxony and the Prussian duchy of that name, and separated from each other by the circle of Neustadt, an outlying portion of the grand-duchy of Saxe-Weimar. Since the year 1616, the possessions of the House of R. have been divided between the elder and the younger lines. The principality of R.-Greiz (the elder line) is 123 sq. m. in extent, and had, in 1880, 50,782 inhabitants. The chief town and seat of the government is Greiz (q. v.). The principality of the younger line is R.-Schleiz, area 320 sq. m.; pop. (1880) 101,330. Capital, Schleiz (q. v.). Of both principalities the surface is hilly, being transversely by the Frankenwald, whose chief summits are upwards of 2000 feet in height. The chief rivers are the Saale and the Elster, the valleys of which are extensive and well cultivated. Large tracts are covered with forests and in pasture, and cattle and timber are exported. By the constitution of 1867, R.-Greiz obtained some much-needed reforms. Patrimonial jurisdiction was abolished, the administration of justice put under the management of regular courts, and a form of representative government granted to the people (7

of the 12 members of the single chamber being elected by town and country). The existing constitutional form of government in R.-Schleiz dates from 1852; 12 of the 16 representatives are elected by the people. The population in both states is almost wholly Protestant, and is industrially prosperous.

REUTER, FRITZ, a novelist and poet who wrote in the Platt-Deutsch or Low-German dialect, was born 7th Nov. 1810 at Stavenhagen in Mecklenburgh. While studying law at Jena, he became involved in the revolutionary aims of the students' association, the *Burschenschaft*, was in 1833 sentenced to death, but got off with seven years' imprisonment in Prussian fortresses. He subsequently lived by his numerous writings, which gave a vivid picture of the distinctive manners and customs of the Low-German country. His best known works are *Olle Kamellen* and *Ut Mine Stromtid*. He died 12th July 1874.

REUTER, BARON PAUL JULIUS, well known from the familiar newspaper heading 'Reuter's Telegrams,' was born at Cassel in 1818, and early became a telegraphist. In Aix-la-Chapelle he gradually formed an organization for collecting and transmitting telegraphic news; and in 1851, R. now a naturalized British subject, transferred his headquarters to London. As telegraphs extended throughout the world, his system multiplied its ramifications, and newspapers gained in copiousness and freshness of news. In 1865, R. made over his business to a limited liability company; in 1871, he was made a German baron; and in 1872, obtained from the Shah of Persia the—as yet inoperative—privilege of making all the railways of Persia.

REUTTLINGEN, a town of Württemberg, situated in a beautiful district, fertile in fruit and wine, on the Echatz, a feeder of the Neckar, 20 miles south of Stuttgart. Its houses are old and picturesque; and it was formerly surmounted by walls and moats, the site of which, however, is now occupied by streets. The church of St. Mary, completed in 1845, and surmounted by a pierced tower 325 feet high, which is considered the most beautiful in the kingdom, is a noble Gothic edifice. Woollen and cotton yarns are spun, and cloth, leather, cutlery, hosiery, &c., are manufactured. Pop. (1880) 16,515.

REVALENTA ARA'BICA, a name given to a preparation which has long been sold as an empirical diet for invalids, extraordinary restorative virtues being attributed to it. It is only a preparation of the common lentil, its first name being formed for disguise from its botanical name, *Ervum Lens*. Its real value is about equal to good pea-meal.

REVEA'L, REVEL, the square ingoing of the sides and lintel or arch, of doors and windows between the face of the wall and the framing.

REVEILLÉ, in an army, is the beat of drums at break of day, to warn the troops that the night is past, and the sentries to forbear from challenging.

RE'VEL, or REVAL, a Russian seaport, capital of Esthonia, stands on a small bay of the same name, 238 miles S.W. of St. Petersburg. It is divided into the upper and lower towns, which till 1878 had separate administrations. The former, occupying the top of a rocky ridge, contains the cathedral, the castle, gymnasium, governor's residence, and the houses of the nobility. The lower town extends to the sandy shore of the harbor. Till lately R. was a fortress of the first rank. The population is mostly of German extraction. It was long held by the Lithuanian Order of Knights; was made over to Sweden in 1562; bombarded by the Danish and Lübeck fleets in 1569; and besieged by Peter the Great, and annexed to the Russian empire in 1710. In 1718, a naval harbor was founded. The chief articles of export are flax, linseed, rye, skins, corn, and potato-brandy, supplied by land from the governments of Esthonia, Pskov, and Livonia. The chief imports are salt, fruits, wine, and manufactured and colonial goods. Pop. (1880) 50,860.

REVELA'TION is a familiar theological expression, commonly applied to the knowledge of Himself which God has given us in Holy Scripture. In itself, however, the word is properly, and of late years has been frequently used, not merely of the divine knowledge communicated to us in Scripture, but of all divine knowledge communicated through whatever source. Conscience and reason are in themselves modes of revelation, in so far as they witness to us of the divine laws which bind our moral life, and in harmony with which the health and happiness of that life can alone be found. History is also a species of revelation, unfolding, as it does, the same divine laws collectively in the race. Then nature reveals the divine power, wisdom, and goodness; and science, the interpreter of nature, in so far as it makes known the great laws governing the material universe, truly makes known the divine will to us. But it is with the Scriptures of the Old and New Testament that the idea of revelation has come to be especially associated. The Holy Scriptures are undoubtedly in a special sense the medium of divine revelation to the human race. God has made known to us therein more fully

and clearly than elsewhere His will and character. But at the same time we must not confound revelation, in its fact and essence, with the books of Scripture. These books are only the highest or most distinguished form or medium of revelation, which, in itself, and essentially, must always imply communication from one mind to another; and, in a religious sense, from the divine to the human mind. Scripture is, in its several books, the pre-eminent medium of this contact or interchange of the divine and human. It is the record of special communications which God made in time past to holy men, 'who spake as they were moved by the Holy Spirit.' It contains, in short, a revelation for us; but the revelation is not the record, but the knowledge which the record conveys to our minds.

REVELATION OF ST. JOHN (*Apokalypsis Ioannou*) the last book of the New Testament Scriptures. It professes to be the production of St. John, traditionally known as 'The Divine' (*ho theologos*). It has been a subject of dispute, however, whether St. John, the author of this book, is the beloved disciple, the author of the fourth gospel and of the three Epistles, or not. Upon the whole, the balance of evidence and of authority seem to be in favor of the supposition that he is the same, although some distinguished names—Luther in the past, and Lücke among modern critics—have adopted the negative view of the question. The author's simple mention of himself by his name John; his description of himself as one 'who bare record of the word of God, and of the testimony of Jesus Christ, and of all things that he saw,' is held to indicate strongly an identity with the author of the gospel, who speaks of himself in similar language (John xix. 35). He writes from Patmos, and the apostle is the only John distinctly named in the early Christian history as an exile in Patmos. The authority, moreover, with which the writer addresses the seven churches in Asia is such as may be supposed only to suit an apostle. So far as historical testimony is concerned, the authority of the early Christian Fathers—e. g., Justin Martyr, Theophilus of Antioch, and Irenæus, and Clement of Alexandria—all point to the Apostle John as the author of the Book of Revelation. The date of the book is supposed to be the very close of the 1st c. 95–97 A.D., or the end of the reign of Domitian. We cannot hear particularize the contents of the book, nor can we enter into any detailed statement of the different interpretations which have been given of it. It has been the subject of very varied and conflicting commentary.

It has been stated that 'not less than 80 systematic commentaries are worthy of note, and that the less valuable writings on the subject are unnumbered, if not innumerable.' All that we can do here is to characterize the different schools, so to speak, into which the interpreters of this wonderful book may be arranged: 1. The *Præterist* School of interpreters, who look upon the Revelation as fulfilled in the past, and especially in the great conflicts of Christianity with Judaism and Paganism, and its triumph over them in the ages following the time in which it was written. To this class of interpreters belong, among others, Grotius, Hammond, Bossuet, Calmet, Eichhorn, Ewald, Lücke, De Wette, Stuart, Lee, Maurice. 2. The *Futurist* School regard the book, with the exception of the first three chapters, as referring to events yet to come to pass; and this view has been advocated, in modern times, by such writers as Dr. J. H. Todd, Dr. S. R. Maitland, Newton, and others. 3. What has been called the *Historical and Continuous* School of expositors, who regard the Revelation as a progressive symbolic history of the fortunes of the church from the 1st c. to the end of time. To this school of interpreters belong a host of eminent names, such as Mede, Sir I. Newton, Vitringa, Bengel, Faber, Elliot, Wordsworth, Alfred, Hengstenberg, Ebrard, and others.

There are others, again, who are not disposed to allow any exact prophetic character to the book, but simply to regard it as a species of symbolical poem, setting forth the eternally-recurring principles of the divine government. The real fulfilment of the Revelation, therefore, is not to be sought in any definite historical events, but in the vindication of these principles shadowed forth more or less in great historical crises, yet transcending all partial historical results. The grand symbolic imagery of the book has never found and never will find its exact counterpart in any earthly facts, but it finds its spiritual counterpart constantly in the career of the church—the unceasing conflict of truth with error, of righteousness with sin, of life with death, of the kingdom of God with the kingdom of evil, and will attain to its true realization only on the destined triumph of the former over the latter.

REVELS, MASTER OF THE, or LORD OF MISRULE, the name of an officer, who, in England, was attached to royal and other distinguished houses, whose function it was to preside over the amusements of the court, or of the nobleman to whose house he was attached, during the 12 Christmas holidays. This officer, sometimes called *Master of the Tents and Revels*, became a permanent appendage to the English court in the reign of Henry

VIII., and his duties included the keeping the tents and pavilions which accompanied the sovereign on a royal progress, as also the keeping the dresses and masks used in entertainments given at court, and the providing of new ones when required. In Queen Elizabeth's time, we find the Mastership of the Revels divided into several distinct offices. The office continued to exist till the reign of George III., when it was altogether discontinued.

REVENUE, PUBLIC. A state has a right to reserve part of the property of the citizens, or of the produce of the country, or to exact contributions from the citizens, to supply the expense of carrying on the government. It is also entitled to augment the riches of the state by taxing merchandise imported into or exported from the country, and by taking a small part of the things consumed. In the United Kingdom, this branch of the sovereign power is vested in parliament.

The revenue of the crown, in England, has been divided by Blackstone into two branches, designated ordinary and extraordinary; the former attached to the crown by hereditary right, the latter specially granted by parliament as a supply for national purposes. The so-called ordinary revenue was the more important of the two, in the early history of the country, consisting in a great measure of the rents of the crown-lands; but these came, in the course of time, to be delapidated by alienation and improvident management; and what remains of the hereditary land and forestal revenue of the crown, is now intrusted to certain officers, called Commissioners of Woods, Forests, and Land Revenues (see **WOODS AND FORESTS**), who act under the control of the Treasury. From the diminution of the hereditary revenues of the crown, subsidies have become the chief source of supply, a circumstance constitutionally of great importance, as it has rendered the crown dependent on parliament for its ordinary support and existence.

The popular voice, in the matter of taxation, was admitted as early as the reign of Edward I., an act of that monarch declaring 'that no tallage or aid shall be taken or levied without the goodwill and assent of the archbishops, bishops, earls, barons, knights, burgesses, and other freemen of the land.' The laity were thenceforth taxed by the votes of their representatives. The lords spiritual and temporal voted separate supplies for themselves; and from the reign of Edward I., the clergy, as a body, granted subsidies, either as a national council of the clergy, in connection with parliament, or, at a later period, in convocation, till the disuse of this right in the reign of Charles I.

As the Commons increased in political importance, the subsidies voted by them became the principal sources of revenue, and they gradually assumed their present position in regard to taxation and supply, including the lords as well as themselves in their grants. Concurrently with parliamentary taxation, imposts were formerly levied by royal prerogative alone; but none of these survived the Revolution of 1688. A grant by the Commons is not effectual without the ultimate assent of the Queen and House of Lords; the Lords, however, cannot alter a bill of supply, though they may refuse their assent to it.

The royal speech at the opening of parliament requires the Commons to make provision for the public service, and states that estimates will be laid before them. The Commons, referring to the royal speech, resolve that a supply be granted. Sitting as a Committee of supply, they consider what specific grants shall be voted; and sitting as a Committee of Ways and Means, they deliberate on the manner in which the necessary funds shall be raised. When some progress has been made in voting the estimates, the Chancellor of the Exchequer brings forward, in the Committee of Ways and Means, his annual statement, popularly known as the Budget, embodying his views on the probable revenue and expenditure of the year. Apart from the services voted in detail by the Committee of Supply, there are some few permanent charges which the Treasury is bound to defray from the Consolidated fund, such as the interest of the national debt, the civil list, the annuities of the royal family, and the salaries and pensions of judges and some other public officers.

When taxes are imposed or altered, the government begins to levy the new duties as soon as the resolutions for that purpose are agreed to by the House. A control is established over the expenditure of the supplies by the long-established practice of separating the custody of the public revenue from the function of payment, the former being vested in the Exchequer, and the latter in the Treasury, and the officers of the Exchequer being empowered to refuse their sanction to any demand not in accordance with the determination of the legislature. By an arrangement effected by 4 and 5 Will. IV. c. 15, the public revenue is now paid into the Bank of England, to the credit of the Comptroller-general of the Exchequer, an officer independent of the ministry, who can only be removed on a joint-address to the crown from both Houses of Parliament.

The principal sources of revenue are now the customs, the excise, the stamp-duties, the land-tax and house-duty, the property

and income tax, the post-office and telegraph service, and the crown lands. The excise, stamps, and taxes have been placed, by 12 Vict. c. 1, under the control of a board called the 'Commissioners of Inland Revenue.' The aggregate of the different sources of revenue is paid into a fund called the 'Consolidated Fund,' founded by 27 Geo. III. c. 47, which is chargeable with the interest of the national debt, and is mortgaged to raise an annual sum for the maintenance of the royal household and Civil List (q. v.).

The following table exhibits the gross revenue and expenditure of the United Kingdom, in the year ending March 31, 1880 :

REVENUE.	
Customs.....	£19,326,000
Excise.....	25,300,000
Stamps.....	11,300,000
Land-Tax and House-Duty.....	2,670,000
Property and Income Tax.....	9,280,000
Post-office.....	6,350,000
Telegraph Service.....	1,420,000
Crown Lands (net).....	390,000
Interest on advances.....	1,254,596
Miscellaneous.....	4,024,459
Total Revenue.....	£81,265,055
EXPENDITURE.	
Public Debt.....	£28,763,874
Civil List and Consolidated Fund.....	1,598,544
Civil Services.....	15,324,596
Army.....	15,645,867
Indian Home Charges.....	1,115,050
Abyssinian War.....	634
War in South Africa.....	3,244,920
Navy.....	10,416,131
Expense for collecting Customs.....	978,841
Inland Revenue.....	1,810,475
Post-office.....	3,333,000
Telegraphs.....	1,107,000
Packet Service.....	772,820
Localization of the Forces.....	250,000
Total Expenditure.....	£84,855,752
Excess of Expenditure over Income.....	£3,090,697

In the year 1879-80 the revenue was at the rate of £2, 7s. 7d. per head of the population; and the expenditure, £2, 9s. 3d. per head. In 1878-79, the revenue was £83,115,972; and the expenditure, £85,407,789. In 1880-81 the income was £84,041,000; while the expenditure was £83,108,000.

The revenue of British India for 1879-80 was £68,485,000, and the expenditure £69,668,000. The revenue of France is about £110,000,000; of Russia, £80,000,000; of Austro-Hungary, £64,000,000; of Italy, £56,000,000; of Germany (the empire), £28,000,000; and of Spain, £32,000,000.

In 1801 the gross revenue of Great Britain was £35,218,525, and of Ireland £2,919,217; in 1861-62 Great Britain raised £61,360,749, and Ireland £6,792,606. So that in 1801 the revenue was £3, 7s. per head of population, and in Ireland 11s. 2d.; while in 1861-1862, the amount per head was £2, 13s. in Great Britain, and £1, 8s. 6d. in Ireland. At the conquest, the public revenue of England is estimated to have been about £400,000; and in the reign of Henry VI., it had fallen to £65,000. Under Henry VIII., it rose to £300,000; and under Anne, at the union with Scotland, it was £5,700,000.

REVERBERATORY FURNACE, a furnace so constructed that matter may be heated in it without coming in direct contact with the fuel. It consists essentially of three parts—viz., a fireplace at one end; in the middle, a flat bed or sole, on which the material to be heated is placed; and at the other end, a chimney to carry off the smoke or fume. Between the fireplace and the bed, a low partition-wall, called a fire-bridge, is placed, and the whole built over with a flat arch, dipping towards the chimney. The flame plays over the fire-bridge, and is reflected or *reverberated*, on the material beneath, hence the name. See **LEAD** (figs.).

REVEREND (Lat. *reverendus*, to be respected), a title of respect given to the clergy. In Roman Catholic countries, it is applied to the members of the different religious orders. In France, before the Revolution, archbishops, bishops, and abbots were alike 'Most Reverend.' In England, deans are 'Very Reverend'; bishops, 'Right Reverend'; and archbishops, 'Most Reverend.' In Scotland, the clergy in general are 'Reverend,' while it is the practice to apply 'Very Reverend' to the moderator of the General Assembly for the time being, to a synod, and to the principal of a university, being a clergyman. The General Assembly itself is usually styled 'Venerable,' but the address

of the Lord High Commissioner begins with the words: 'Right Reverend and Right Honorable.'

The style Reverend is generally adopted by, and given to, the clergy of the different dissenting bodies; but there have been instances in which some of them have repudiated it.

REVERIE has been defined the dream of a waking man; it differs, however, in many respects; from dreaming. In an exaggerated form, it is of rare occurrence; but when exceeding absence of mind, or abstraction from what is passing around, it is abnormal and unhealthy; and may, under all circumstances, be regarded as a phenomenon of an imperfectly constituted, if not of a diseased nervous temperament. It is, moreover, generally, and always at its commencement, under the control of the will. Reverie is apparently, in all cases, an exaltation of the faculty of attention: the mind may be occupied according to the age, character, pursuits of the individual, by calculations, profound metaphysical inquiries, by fanciful visions, or by such trivial and transitory objects as to make no impression upon consciousness, so that the period of reverie is left an entire blank in memory. The most obvious external feature marking this condition is the apparent unconsciousness, or partial perception, of external objects. In what may be designated the first stage, castle-building, this inattention is only apparent, as the surrounding scenery may enter into the illusion, and constitute a part of the romance. In the celebrated case of Hartley Coleridge, whose double life, indulged in for years, affords illustrations of voluntary creations ultimately extorting a degree of belief and expectation—from a field near his home burst forth a cataract, from which flowed a river; on the banks of this arranged themselves fertile fields, a populous region, divided into realms and kingdoms, governed by laws, having traditions, histories. 'Ejuxria' was in fact, an analagon to the world of fact, embellished by imagination. This cherished unreality was parted with reluctantly.

A more advanced stage of the affection is where, independently of the will, and in opposition to the ordinary habits of the individual, and under peculiar circumstances, there occur a loss of cognizance of surrounding objects and relations, and a state of abstraction or brown-study, in which many absurd and incongruous things are said and done. Ludicrous examples of this state are witnessed where a man loses his way in his native town, forgets his own name, or retires to bed in the middle of the day. It is related that Sir Robert Peel, utterly unobservant of the adjournment of the House of Commons, and the departure of the members, remained on one occasion unmoved in his seat, plunged in a profound reverie, until the lights were about to be extinguished, and he was roused by the clerk of the House. In a third stage or form, the reverist cannot be recalled to active perception, loses individuality, and is absorbed in the contemplation of unreal, though self-suggested impressions. This is seen in such cases as St. Teresa, and in the trances of Mysticism, Quietism, Second Sight.—*Memoir of Hartley Coleridge, Disraeli's Life of Lord G. Bentinck, Maury's Le Sommeil et les Rêves.*

REVERSE, in Numismatics, the side of a coin or medal which does not bear the principal device or inscription. There is, however, generally an inscription or device on the reverse; and when the lower part of it is markedly separated from the rest, it is called the **EXERGUE** (Gr. *ex ergo*, without the work), and bears a secondary inscription.

REVERSED, in Heraldry. A term applied to a charge turned upside down.

REVERSION. When the enjoyment of money, or of any kind of property, is postponed until, or contingent on, the happening of a given event or given events, the present right to the deferred benefit is called a reversion. When the emergence of the right is certain, and the date fixed, to ascertain the immediate or marketable value of a reversion, is a very simple calculation; for example, let it be required to know for what sum a man should sell the right to receive £100 payable ten years hence. Suppose that he expects to be able to improve the money for which he sells his right at five per cent. per annum, compound interest, then one obvious way to get an answer to the question is simply to calculate what sum annually accumulated at the assumed rate will in ten years amount to £100. The answer (see art. **INTEREST**) will be found to be £61, 7s. 10d. When the date of the emergence of the reversionary right is uncertain, the purchase, in an individual case, must always be a speculation; but if there are a sufficient number of such rights, postponed to events of which there are sufficient observations from which to deduce laws of average, then the marketable value is easily calculated: for example, it is required to know what is the immediate value of £100 payable certainly on the death of a man aged 60. Here the perpetuity divides itself into the present value of an annuity of the annual interest of the £100 on the life of a male aged 60, and the reversionary right which is to emerge when the life fails. Having then ascertained the former value, and deducted it from £100, the remainder will be the present value of the reversion.

When an assurance company buys a reversion, it is simply buying that which it sells when it grants a policy of life assurance. In the former case, however, an office, to secure its expenses and profits, will assume a high rate of interest and a long life; in the latter case, for the same reason, it will assume a low rate and a short life.

Where the reversion is contingent, problems arise whose solution requires the utmost skill on the part of the actuary; for instance, B, aged 80, wishes to borrow £100 on the security of a sum payable to him in the event of his surviving A, aged 58. Here the security being doubtful, it could only be rendered marketable by assuring a sum to be paid in the event of B dying before A; and there would remain the important question of what this sum should be, so as to cover the loan and the premiums of assurance with yearly accumulations on both. This question will be found ably discussed in a paper by Mr. Lang in the *Assurance Magazine* for 1850, p. 18.—On the general subject, see the works that deal with questions of insurance and interest, and repeated articles in the *Assurance Magazine* and like periodicals.

REVERSION is that right to property which remains after some particular estate has ceased which had been granted by the owner. Thus, if A has a life estate in B's property, and after he dies, the property returns to B, B is said to have the reversion, or to be the reversioner. The landlord of property let to a tenant is called the reversioner, because, the moment the lease determines, the whole of the property and possessions vest in him. In the sale of reversionary estates, owing to the want of a system of registration of deeds, great risk is incurred by the purchaser lest the property should be burdened by some rent-charge.

REVE'TMENT, in permanent Fortification, is a retaining-wall of masonry built for the purpose of holding back the earth of which works are composed. The most ordinary position of revêtements is for the escarp and counterscarp of the ditch (see FORTIFICATION). The most important of these two is the escarp, which has to hold back the great mass of earth represented by

the rampart, parapet, banquette, &c. It is usually of solid brick work or stone, 5 feet thick at the top, and sloping outwards as it descends (on the ditch-side only) to the extent of 1 in 6. Prior to Vauban's time, the escarp revêtement was commonly raised to the top of the parapet; but as in this case the artillery of a besieger played on the top of the wall, and ruined it soon after the siege commenced, that engineer adopted the principle—thenceforth followed—of raising it no higher than the crest of the glacis, or about 7 feet above the natural ground, leaving the parapet above of sloped earth only. When the main ditch is 24 feet deep, the scarp revêtement will be about 30 feet high. Additional strength is imparted to the revêtement wall by massive buttresses at every 15 feet, called *counterforts*, and these, again, are sometimes connected and strengthened by masonry arches outside the revêtement. The revêtement forms a terrible barrier to an assaulting party. In field-works, temporary revêtements may be made of timber, turf, hurdles, or other materials at hand.

REVIEW', in Military parlance, is the inspection by the sovereign or some staff-officer of any body of troops in parade order. Reviews always comprise a march past the inspecting-officer in column, and a general salute in line; to these is frequently added a mock-battle, for the amusement of spectators, and the practising of the troops themselves in warlike manœuvres.

REVIEW. The name applied by common literary usage to such periodical publications as are made up of essays, criticism, and the like. See PERIODICAL.

REVISING BARRISTER is a barrister appointed annually by the English judges to revise the lists and settle who are the persons entitled to vote for members of parliament. For this purpose, all England is subdivided into districts, and a barrister is appointed for each district by the judges of assize. Though the appointment is only for one year, yet practically the same person is reappointed for life. The barrister must be of three years

standing at least. The revision of the lists takes place generally between August and October of each year. There is an appeal from the decision of the revising barrister to the Court of Common Pleas at Westminster.—Similar duties are performed in Scotland by the sheriff-substitute.

REVIVALS OF RELIGION. The term *Revival of Religion*, or, more briefly, *Revival*, is employed to denote an increase of faith and piety in individual Christians, particularly after a period of religious declension, and also an increase of religion in a community or neighborhood, both through the *revival* of those who are already religious, and through the *conversion* of the previously irreligious. In these applications, its use is countenanced by several passages of Scripture; the idea which it is intended to convey is, however, far more frequently suggested by passages in which the term does not occur. The idea of revival is more particularly connected with the system of 'evangelical' doctrine, and particularly with that part of it which relates to the work of the Holy Spirit in the conversion of sinners.

What are commonly called revivals of religion may be described as religious movements or excitements extending, more or less generally, over a neighborhood, or sometimes over a country. By those who regard them as genuine, it is urged in their favor, that they are in accordance with what the Scriptures teach us to expect, and that we have instances of a similar kind recorded in the Scriptures themselves—both in the history of the Jews, and in the early history of the Christian Church, particularly in the effusion of the Holy Spirit on the day of Pentecost, and afterwards in connection with the ministry of the apostles, when many were converted through a single discourse, or, in other cases, evidently within a short time. It is further urged that the promise of the effusion of the Spirit in 'the latter days' was not completely fulfilled on the day of Pentecost, but relates to the whole period of the Christian dispensation, and that, according to many prophecies, we have reason to expect even more of it in future times than there has hitherto been, so that 'a nation shall be born in a day, and the kingdoms shall be the Lord's.'

The Reformation of the 16th c., and the more partial movements of the same kind which preceded it, are also regarded as essentially revivals of religion—the Reformation itself the greatest which has taken place since the apostolic age. The great development of religious fervor in England in the 17th c., is, according to this view, to be considered as a revival, and the extravagances which attended it as mere excrescences, like those of the Anabaptists in the time of the Reformation. The next great movement of the same kind was that in the first half of the 18th c., from which the Methodist churches originated (see METHODISTS). It was accompanied with many circumstances similar to those which have attended later revivals of religion. The term revival did not begin to be commonly employed till after this period; and the revival which took place in New England and other parts of North America about the same time, was then and still is generally designated the *Great Awakening*. The beginning of this revival seems to have had no connection with the Methodist movement in England, although subsequently they became connected through Mr. Whitefield's visits to North America. The revival in New England, which began about 1734, under the ministry of the celebrated Jonathan Edwards at Northampton, and rapidly extended over great part of New England and New York, was speedily followed by similar religious movements in Scotland, not altogether independent of it. Such religious movements had not, however, been unknown in Scotland before, although very much confined to particular times and localities.

In 1625 and some following years, there was a revival at Irvine, under the ministry of Mr. David Dickson—a minister of more than ordinary abilities and attainments, some of whose works have recently been republished—so considerable as to be noticed in many histories of the church of Scotland, and which, because it extended very much to the neighboring parish of Stewarton, and along the banks of the Stewarton Water—the people of that district frequenting Irvine on market-days, and hearing Mr. Dickson's lectures—was contemptuously styled by its adversaries the *Stewarton sickness*. In 1630, several hundreds are said to have been converted at once, through a sermon preached at Kirk-of-Shotts by Mr. John Livingstone, then a young preacher, but afterwards an eminent minister of the church of Scotland, and a sufferer for the cause of Presbyterianism. About the same time (1623—1641), similar movements took place in Ireland under the ministry of Scottish Presbyterian ministers settled in Ulster, and to which the origin of the Irish Presbyterian Church must in great part be ascribed. The Presbyterians of Scotland were thus in some measure prepared to acknowledge the revivals of the earlier part of the 18th c. as genuine, which began at Cambuslang—Mr. McCulloch being minister of that parish—in 1742, and speedily extended to Kilcath and other parishes in the neighborhood, as well as to Dundee and other places more remote. No similar movement, however, took place over the country generally; nor was there

anything of the same kind again till the very end of the century, when a revival took place (1798—1800) at Moulin in Perthshire, of which Mr. Alexander Stewart was then minister. This was followed in a few years by a revival in Arran (1804—1813), under the ministry of Mr. M'Bride. Other similar local revivals followed, not unfrequently, and in parts of Scotland widely remote from each other, both in the Highlands and Lowlands; and also in other parts of Britain, particularly a very extensive one in Wales, resulting in the formation of the Welsh Calvinistic Methodist Church, but not confined in its effects to those who became connected with that church. Local revivals also in some instances attended the ministry of evangelical ministers of the Church of England.

In 1839, the attention of all Scotland was drawn to a religious movement at Kilsyth, which was followed by similar occurrences in a number of other places, more or less evidently connected with it. The first appearance of an unusual degree of religious feeling at Kilsyth was in the parish church, during a sermon by Mr. William C. Burns, a son of the minister of the parish, and afterwards a missionary in China. The emotion of many of the congregation broke out in sobs and cries, so that for a time the preacher's voice could scarcely be heard. For months, religion was the almost exclusive subject of interest to a great part of the inhabitants of the parish, and many meetings for public worship were held besides the ordinary Sabbath services, at which great emotion was often displayed. Among the other places to which this movement notably extended was Dundee, where Mr. W. C. Burns was then stately employed in the ministry of the gospel. After 1839, there were revivals from time to time in various places in Scotland; but none of great extent or interest there or elsewhere in the British Islands for nearly twenty years. There had, meanwhile, been many revivals in America, generally, indeed, confined to particular congregations, seminaries, or localities, but sometimes extending over considerable districts; and throughout at least the northern and middle parts of the United States, the idea had become familiar to the popular mind, that revivals of religion ought to be expected from time to time; from which naturally followed the belief that means ought to be employed to produce them. From this resulted, in some cases, increased earnestness in preaching and prayer, with greater assiduity in the use of all the ordinary means for the promotion of religion; in other cases, direct endeavors to produce excitement, as by *camp-meetings*—assemblies of great numbers of people held in the open air, at which exciting addresses were delivered by preacher after preacher, to work upon the nervous sensibilities of the audience.

Nothing of this kind, however, attended the commencement of the great religious movement which took place in 1857 and in the two following years. Its origin is ascribed in part to the thoughts and feelings awakened during a period of great commercial distress. It began in New England, particularly in Connecticut and Massachusetts, and rapidly extended to New York and over the middle and western states. It was not generally attended with scenes of great excitement. Strong, but calm religious feeling was its general characteristic. In the city of New York, almost every congregation received a great accession of members, and prayer-meetings were held for about an hour in the middle of the day, which were attended by great numbers of persons actively engaged in business. More than 2000 places in the state of New York were reported as partaking of this revival. Not long after it began in America, a similar movement took place in the north of Ireland, not apparently connected in its origin with that in America, although certainly connected with it soon afterwards, and promoted by the news brought across the Atlantic. It rapidly extended over the whole north of Ireland, and subsequently to many parts of Scotland, Wales, and some parts of England. As a rule, it was free from excitement, and characterized by little else than the intensity of religious feeling displayed. Another remarkable revival, which extended over the greater part of Great Britain in 1874—1875, originated in the efforts of two American evangelists, Messrs. Moody and Sankey, and was characterized by the almost entire absence of sensationalism.

Revivals of religion have occurred also in other parts of the world. About fifty years ago, a widespread movement of this kind took place in Switzerland, although not affecting more than a small part of the population anywhere. Under the ministry of Felix Neff, it subsequently extended to the Protestant districts of Dauphiné, and to the neighboring Vauds or Waldenses, on the Italian side of the Alps. Similar religious movements have occurred in many parts of Sweden.

Revivals have been accounted for in very different ways; but in general, too evidently in mere accordance with the different religious views of those by whom the theories have been proposed. Some have attempted to explain the phenomena of religious excitement extending over wide districts, and rapidly spreading from one place to another, by the supposition of a kind of epidemic disease affecting the mind. Another opinion was very preva-

lently entertained by those who do not see in revivals anything really good, is, that they are the result of endeavors to work upon the feelings. It is replied, that although this theory might be plausibly enough advanced, if only such things were considered as the camp-meetings of the American Methodists, it is far from being in accordance with the best ascertained facts as to many of the revivals which have taken place both in America and in other countries. It is certain that many of these have taken place without any apparent attempt to work upon the feelings, more than is ordinary and proper in the preaching of the gospel, and that the greatest display of emotion has often been connected with preaching of the most simple and sober kind.—By those who believe in the reality of revivals, as productive of a true increase of religion, they are generally ascribed to the operation of the Holy Spirit, to which, according to the 'evangelical' scheme, the 'conversion' of every individual soul is ascribed, and also all increase of faith and piety in the converted.

Revivals have, however, often been regarded with doubt by many who believe in the whole doctrine of the work of the Spirit as generally held in the Protestant churches, but who look upon the excitement frequently attending them as inconsistent with the proper sobriety and solemnity of religion, and think the progress of religion ought rather to be expected to be gradual, and without very much to call particular attention to it at one time more than another. It is replied, that while a blessing on the regular use of ordinances may confidently be expected, if duly sought by prayer, there is yet much in Scripture to favor the notion that particular seasons may be unusually marked by the evidence of it; and further, that revivals, when they take place, generally show the usefulness of the ordinary means employed for the promotion of religion, as they seldom occur among persons very ignorant of religion, but rather among those who have previously enjoyed the benefit of the most faithful ministrations. With regard to the excitement attending many revivals, it is argued that this excitement is not wonderful, if persons are suddenly impressed with a deep sense of their sins, of the danger of divine wrath, and of the importance of religion; and that it is in some measure also to be expected in those who are brought by a quick transition from deep distress to a full sense of forgiveness and the favor of God. Are we to be surprised, it is asked, if persons in such circumstances, after much effort of self-restraint, cry aloud in the congregation, or fall down, overpowered by their emotions?

It is sometimes alleged by the opponents of revivals, as an objection to them, that much of the excitement manifested in them is merely hysterical; and some of their advocates have rashly denied that this is the case; others, admitting it, deny that it affords any just cause of objection, and maintain that hysterical excitement is natural and unavoidable in such circumstances, and however undesirable in itself, is a manifestation of the reality and strength of the feelings awakened. They acknowledge, however, also, that like similar excitement produced by causes which have nothing to do with religion, it may extend from one to another, even where the cause in which it originated does not operate; and they therefore refuse to see in it, considered by itself, any evidence of the religious or spiritual condition of the persons affected by it.

That much folly and extravagance have often been exhibited in connection with revivals of religion, is freely admitted by many who are fully convinced of their reality; but this, they say, is also only what might be expected, as the occasion always seems a favorable and inviting one to persons whose zeal exceeds their discretion, and too often affords opportunity for ignorant and self-conceited persons to thrust themselves forward as teachers and conductors of religious exercises.

It may be proper to advert to some of the practices which sometimes take place on occasions of revival, but which are disapproved by all except those who are filled with the desire of seeing excitement produced and increased. Among these is the bringing forward of persons in the character of new converts, to conduct prayer in public, and to address meetings, which they are often among the least capable of doing well. Another practice liable to much objection is the permitting of mere youths, under profession of Christian zeal, to converse in private with persons in distress of mind, especially when these are young persons of the other sex. A third objectionable practice is the calling upon those who are anxious about their salvation to come forward and occupy a place by themselves—or what are called in America *anxious seats*—that they may be individually conversed with, and that special prayer may be made for them, they being thus brought into a publicity which is undesirable. It is hardly necessary to refer to the absurdity of demanding—as has sometimes been done—a show of hands from those who are now resolved to give themselves to the Lord! With such uncommendable practices may be classed that of encouraging persons who have been of very profligate life to recount their own history, which has sometimes been carried so far, that they have seemed even to glory in the enormity of their past wickedness.

Certain peculiar modes of expression, which might not unaptly be designated a kind of slang, have often come into use in connection with revivals of religion, with the unhappy effect of exciting disgust in many minds, and particularly among the most educated classes of society. Thus, in the revival of last century in New England, the subjects of the revival—in a certain state of their experience—were spoken of as being *filled*. In the recent revival in Ireland, it was common to speak of those who fell down suddenly in congregations or in their own houses as *stricken*, and as the *stricken ones*. It was very common during the same revival to speak of individuals as having *found peace*; and this finding of peace was by some regarded as proof of conversion, or even as indicating the moment of conversion—all which was considered by many who fully believed in the reality of the revival, as unscriptural and delusive.

Among the evils acknowledged to attend revivals by those who believe them to be real, but who also believe that there is often much connected with them which is not the work of God, is the disposition to judge of the spiritual state of individuals, as converted or unconverted. *New converts*, especially when brought into undue prominence, are apt to become elated and self-satisfied, and even to regard themselves as the only true Christians, or as superior to those whose piety is of much longer standing than their own. This, however, is not always the case, and much depends on the judicious or injudicious conduct of the ministers chiefly concerned when a revival takes place.

We have endeavored to present this subject fairly to our readers; but it is evident that as to the opinion to be formed by any one, which must depend upon the general religious views which he entertains. As to mere religious excitement, however, and bodily affections resulting from it, many facts may be adduced to show, what might be supposed beforehand, that these may be connected with religious views extremely at variance. Excitement may be produced by religious views that are utterly false, as well as by those which are true. Heathenism has always abounded in it; Mohammedanism has much of it; and it has appeared in the church of Rome as well as in the Protestant churches. It is not necessary to do more than allude to the extravagances of the Flagellants, and to the strange scenes of the Dancing Mania. Some of the small sects, also, which evangelical Protestants regard as most heterodox, seem to maintain their existence by a systematic working up of excitement.

The subject of this article has been treated in a multitude of publications, almost every revival which takes place calling forth new pamphlets, narrative and controversial. The works of Jonathan Edwards deserve the first attention of those who wish to study the subject; and much information as to the history of revivals will be found in Gillies's *Historical Collections Relating to the Remarkable Periods of the Success of the Gospel*. Reference may also be made to Mrs. Lundie's work on *Revivals in the British Isles*; and for the revivals in Scotland in the middle of the 18th c. to Robe's *Narrative of the Revival of Religion at Kilsyth, Cambuslang, and other Places in 1742* (new ed., Glasgow, 1840). Edwards maintains the genuineness of revivals with perhaps more force of argument than any writer has since done; and most of those extravagances which have sometimes attended revivals down to the present time, might have been avoided if those whose religious views accord with his had more carefully studied his discriminating remarks and sober counsels. No work has yet been produced such as Edwards in one of his letters expresses a strong desire to see—'a history of true, vital, and experimental religion and enthusiasm, bringing down the history from age to age, judiciously and clearly making the distinction between the one and the other.'

REVIVOR is a bill or writ by which a suit or action is kept alive in the English courts of equity or law, where one of the parties dies during its dependence.

REVOCA'TION, when used as a legal term, is the withdrawing or annulling of a deed or will which otherwise would be valid. A will is said to be always subject to revocation, even though the testator say in the most express language that it is not to be revocable, because a will is supposed to be subject to the ever-varying occasions of life. On the other hand, a deed is not capable of revocation, and is in its nature final and irrevocable; but if an express proviso is inserted which reserves a power of revocation, then this is a valid power, and may be exercised, provided the directions of the deed are strictly followed.

REVOLU'TION, in Politics, any extensive change in the constitution of a country suddenly brought about. The two most important events in modern history known under this name are the English Revolution of the 17th c., and the French Revolution of the 18th. The former began in the early part of the reign of Charles I., with the struggle between that king and his parliament. In 1642, the struggle became a civil war, in which the parliament obtained the ascendancy, and brought Charles to the block in

1649. A republic followed, under the Protectorate of Oliver Cromwell, which was succeeded in 1660 by the Restoration of monarchy in the person of Charles II.; but the arbitrary rule of James II. brought the king and people again into antagonism; and James having fled the country, William III. was called to the throne under such conditions and safeguards as secured the balance of the constitution.—The French Revolution was a violent reaction against that absolutism which had come in the course of time to supplant the old feudal institutions of the country. It began with an outbreak of insurrectionary movements at Paris in July 1789, including the destruction of the Bastille. On the 21st January 1793, King Louis XVI. was beheaded. The Christian religion was deposed, the sacredness of the Republic and worship of Reason solemnized, and a disastrous reign of blood and terror followed, which was brought to an end in 1794, when Robespierre himself suffered on the guillotine the fate to which he had condemned countless multitudes of his countrymen.

Among other important revolutions in the modern world are the American Revolution of 1775, by which the United States threw off their dependence on Great Britain; the French Revolution of 1890, which drove Charles X. into exile, and raised Louis Philippe, Duke of Orleans, to the throne by the will of the people; as also the Revolution of 1848, when France rose against Louis Philippe, and adopted for a time a republican form of government, the revolutionary contagion spreading temporarily over most of continental Europe. By the Italian Revolution of 1859—1860, the various minor sovereignties of Italy were driven into exile, and the whole of the peninsula, became, with the incorporation of the Roman territories in 1870, subject to Victor Emmanuel. The third French republic was also established in 1870-71 by a revolution.

REVOLU'TIONARY TRIBUNAL, the name specially given to the infamous court of judgment—the most extreme republican will scarcely affirm that it was a court of justice—instituted by the French Convention in March 1793, on a motion made by Danton (q. v.), who considered that such a court had become necessary, inasmuch as the recent disasters that had befallen the national armies on the frontiers had led to dangerous conspiracies against the revolutionary government. Its members were chosen from the various departments, and their appointment was ratified by the Convention. Their function was to sit in judgment on all persons accused of crimes against the state, and from their sentence, delivered with appalling promptitude, there was no appeal. During the 'Reign of Terror,' when Fouquier-Tinville (q. v.) was 'public accuser,' it acquired a horrible notoriety, abolishing soon almost all forms of justice, neither hearing witnesses on behalf of the accused, nor allowing him an opportunity of defence, but blindly executing the orders of the 'Committee of Public Safety,' which was merely a tool in the hands of Robespierre (q. v.).—In the provinces, similar tribunals, under the name of 'Revolutionary Committees,' were established, the commissaires-general of which, as, for instance, Carrier (q. v.), shot or drowned suspects in crowds.

REVOLVER, in Firearms, is a weapon which, by means of a revolving breech, or revolving barrels, can be made to fire more than once without reloading. The invention is very far from new, specimens, with even the present system of rotation, being still in existence, which were manufactured at the beginning of the 17th century. Probably the first revolver to suggest itself was one in which several barrels were mounted on an axis, and made to revolve by the action of the trigger, so that their powder-pans came successively under the action of the lock. This principle was never entirely abandoned, and in the reign of George IV. was produced a pistol called the 'Mariette,' which had from four to twenty-four small barrels bored in a solid mass of metal, made to revolve as the trigger was drawn back. At close quarters, such a pistol would doubtless have been useful; but its great weight and cumbrous mechanism rendered aim extremely unsteady.

Contemporaneously from the first with the revolving barrels, went the formation of a revolving chamber or breech, pierced with several cylindrical apertures to receive the charges. Being made to revolve, each motion brought a chamber into line with the one barrel, common to all, whereupon the weapon was ready for use. Numerous patents for this principle have been taken out, including one by the celebrated Marquis of Worcester in 1661. Various improvements were made, especially in the mode of causing revolution, an American, of the name of Eliash H. Collier, patenting such a weapon in the United States and England about 1818.

In 1835, Colonel Samuel Colt brought to a conclusion experiments of some years' standing, and patented his world-renowned Colt's Revolver, which was a great advance on all previous attempts, and is substantially still in use. Colt's revolver consists of one rifled barrel of considerable strength and

a massive chamber perforated with six or seven barrels, which are brought into line with the barrel by action of the trigger.

Fig. 1.

a, the chamber; *b*, hammer; *c*, trigger; *d*, spur for raising the hammer; *e*, lever-ramrod.

Each chamber has its nipple for a cap, which is brought under the hammer by the motion which brings the chamber or breech pieces around. In the most recent form of this revolver, the capped nipple disappears, the cap being contained within the cartridge. The hammer is discharged by the trigger, and acts nearly horizontally in a forward direction. Under the pistol is a fixed lever-ramrod, which is used in loading the chambers. Besides all this, by withdrawing a bolt, which can be done in a moment, the entire breech-piece can be taken out, and replaced by another ready charged, so that, by carrying a spare breech-piece, a person may fire twelve shots in less time than another could fire three if he had to load between the shots. Colt's revolvers are now extensively used in the naval and military services of America and Europe.

Fig. 2.—Chamber with five barrels.

The principal rival of Colt's Revolver has been the Deane and Adams' Revolver, although many more of various sorts have been patented in the interval. The 'Deane' differed in that it could be fired by merely pulling the trigger without also raising the hammer with the finger, as in Colt's; but this was found to be so dangerous in practice, that the inventors soon substituted an arrangement under which it could be fired either by the trigger or by raising the hammer; and lastly, they introduced the great improvement of a spur behind the trigger, which must be pressed by the middle finger, while the forefinger discharges the piece through the trigger. The revolver principle has also been successfully applied to the manufacture of a kind of revolving guns for small projectiles, which are really aggregates of small arms.

The Gatling gun, a revolver of this class, in which the several barrels turned round a common axis, was used during the American civil war. But the best known gun of this description is the French *mitrailleuse* or *mitrailleuse*, of which so much was heard during the Franco-German War. That most commonly used had a group of 25 barrels, surrounded by a bronze sheathing, and movable breech-piece; it was fired by means of a crooked handle or winch at the right-hand side. The range of such guns in a level plain is not great; but amongst fortifications, or in a narrow valley, they may be used with very deadly effect.

REVULSION, in Medicine, a term synonymous with DERIVATION (q. v.). See also COUNTER-IRRITANTS.

RE'WAH, a state of India, called also BAGHELKUND, lying between the North-western and the Central Provinces, subsidiary to the government of the latter, and having for its capital a town of the same name, which is 70 miles south-west from Allahabad, and stands on the right bank of the Tons. The town has a pop. of about 7000. It exhibits remains of former magnificence, but even the walls and the rajah's palace are much decayed. The state has an area of about 13,000 sq. m., and great part of it is well cultivated. The pop. is about 2,035,000.

REWARD, when used in a legal sense, means a sum of money awarded by a court or judge to a witness who has been instrumental in detecting crime. By an English act of parliament of 1827, whenever it appears to a court of assize that a person has been active in apprehending offenders charged with murder, or with feloniously shooting, stabbing, cutting, wounding, or poisoning, or with rape, burglary, housebreaking, robbery, arson, or cattle-stealing, or with receiving stolen goods, the court may order the sheriff of the county to pay to such person a sum of money, to compensate his expenses, exertions, and loss of time. So courts of quarter sessions may order a reward not exceeding £5. If any man happen to be killed while endeavoring to apprehend a criminal charged with any of these offences, the court may also order a sum to be paid to the widow or child. The going to foreign countries to apprehend criminals, is not considered to be a proper ground for giving these rewards. Nor is ordinary stealing from the person a crime which is within the act. Sometimes persons whose property has been stolen inconsiderately offer a reward for its restoration, and persons offer to recover it

for a sum of money. The following enactments of the statute 24 and 25 Vict. c. 96, are directed against this practice.

Whoever corruptly takes any money or reward, directly or indirectly, under pretence of helping any person to any chattel, money, valuable security, or other property which shall have been stolen, embezzled, or illegally disposed of, shall be guilty of felony, and be liable to penal servitude for seven years, or imprisonment for two years. A person may commit this offence though he has no knowledge of or connection with the thieves. Moreover, whoever shall publicly advertise a reward for the return of any property stolen or lost, and shall in such advertisement use any words purporting that no questions will be asked, or that a reward will be given, without seizing or making any inquiry after the person producing such property, or shall offer or promise to return to pawnbrokers or others any money advanced on such stolen or lost property, shall forfeit £50; and whoever shall print or publish such advertisement, shall forfeit the same sum.

REWARDS FOR DISTINGUISHED MILITARY SERVICE are annuities—most commonly of £100 each—granted to meritorious officers in consideration of distinguished service. The officers to whom they are awarded are usually major-generals or colonels, though a few paymasters, quartermasters, and medical officers receive these annuities, which, however, in their case do not always amount to £100. The officer holds the annuity until, being a general officer, he is appointed colonel of a regiment. The amount given to officers in 1882-83 was £15,000; to sergeants, £4920; besides £810 for Victoria Cross pensions, and £8000 for gratuities for long service, &c.

REY'KIAVIK. See ICELAND.

REYNARD THE FOX, the title of a celebrated epic fable of the middle ages, belonging to, and terminating the series of poems in which 'beasts' are the speakers and actors. It is written in Low-German, professedly by a Hinreck van Alckner, 'schoolmaster and tutor of that noble virtuous Prince and Lord the Duke of Lorraine,' and was printed at Lübeck in 1498, under the title of *Reineke Vos*; but German critics in general are disposed to believe that no such person as Hinreck van Alckner ever existed—he is nowhere else mentioned in history, literary or otherwise—and that the real author is a Hermann Barkhausen, town-clerk and book-printer in Rostock, who, according to a common enough practice, sent his book into the world under a pseudonym. A Rostock edition appeared in 1517, which was long believed to be the earliest, until the discovery of a copy—the only one known to exist—of the older Lübeck edition in the Wolfenbüttel Library by Professor Hakemann, who published it in 1711. Since then, the work has been repeatedly republished in Germany—the best edition being that of Hoffmann von Fallersleben (Bresl. 1834; 2d edit. 1852), which is enriched with an 'Introduction,' 'Notes,' and 'Glossary.'—At a comparatively early period, translations were made from the Rostock edition into High-German, that of Mich. Beuther (Frankf. 1544), though badly executed, passing through more than 20 editions. The High-German translation was retranslated into Latin verse by Hartmann Schöpper (Frankf. 1567), and thus gradually found its way into other countries. Goethe translated the work anew into modern German hexameters with admirable spirit and freshness (Berl. 1794), and his translation has been charmingly illustrated by Kaulbach (Mun. 1847); later translations are those by Soltan (Berl. 1808) and Simrock (Frankf. 1845—1852), both of which are executed in the measure of the original—i. e., rhymed iambic couplets. A Danish translation in verse by Herm. Weiger was published at Lübeck in 1555; a Swedish, at Stockholm in 1621—prose version, 1775.

This brief outline of the literary history of *Reineke Vos*, leads us to the second and even more important part of the subject. Was that work strictly an original product of the author's fancy, or was it merely the final form assumed by a widespread fable? Till Jakob Grimm published the results of his laborious researches, everybody supposed that the poem printed at Lübeck in 1498, by whomsoever composed, was the earliest literary embodiment, if not the direct source, of the fable; but that opinion is no longer tenable. Grimm has shown that, in one form or another, the 'beast-fable' (Ger. *Thier-sage*) goes back to the remotest antiquity, and is a common inheritance of the Aryan or Indo-Germanic races—Hindus, Celts, Greeks, Romans, Slaves, Esthonians, Germans—and even the Finns; and he explains with great clearness the conditions of thought, intellectual and religious, under which such a literary form is developed. But all nations do not attain equal success in its cultivation, and it was among the Germans, particularly the Franks, that it attained its most complete poetical elaboration. Grimm is, however, inclined to think that the particular fable of *Reineke Vos* is of German rather than Oriental origin (although the Persian version of Pilpay's fables, entitled *Anwar-i Suhaili*, or the Lights of Canopus, translated by Mr. Eastwick, Hertford, 1854, contains a story strikingly simi-

lar), and that the Franks brought it with them to the Netherlands and to France, where (and not in Low-Germany) it first appeared.

Grimm published, in the *Lateinische Geächte des 10 und 11 Jahrh* (Gött. 1838), some small pieces, containing the nucleus or germ of the fable, and showing how soon, in the hands of the verse-loving monks, it had been turned to didactic and satiric purposes. Somewhat later, other stories make their appearance, bearing more or less on the history of Reynard, but none of them setting forth the fable in the same manner as we now have it—the two principal being *Isegrimus* (apparently the composition of an ecclesiastic in Southern Flanders about the beginning of the 12th c., and containing two stories of the wolf) and *Reinardus* (also originating from a Flemish ecclesiastic named Nivardus, which besides an expansion of the *Isegrimus*, contains ten new stories; its date is about half a century later). But while, in these clerical compositions, side-allusions to the papacy, to the discipline of the church, and to the then powerful and flourishing order of the Cistercians, are very noticeable, in the mouth of the Franco-Flemish people, on the other hand, the story kept itself free of such temporary phenomena, and gradually shaped itself into a style of pure epic satire, reflecting general human characteristics. Before the close of the 12th c., this purer and more epic form of the satire found its way into both German and Flemish literature. In the former, this happened about 1170, when Heinrich der Gliechzare (i. e., Henry 'the Feigner' = Inventor or Troubadour), a native of Alsace, wrote in High-German his *Isegrims nôt*; and again in Flemish, a little later, when a poet, whose name is scarcely known, wrote *Der Reinart*, a work of the purest epic character, and far surpassing all its predecessors both in conception and execution.

Both works were afterwards redacted by unknown hands—the German, about the beginning of the 13th c., when its redactor gave it the title of *Reinhart* (published by Mailáth und Köffinger, in the 'Koloczaer Codex,' Pesth, 1813; and again in a purer state, with all his valuable historical investigations, by Jakob Grimm, *Reinhart Fuchs*, Berl. 1834); the Flemish, about the close of the 13th c., when it received the name of *Reinaert de Vos*, part of which appeared in Grimm's *Reinhart Fuchs*, but the whole of which was published by J. F. Willems (Ghent, 1836—1850), at the expense of the Belgian government.—Meanwhile, in France, the number of poems in which fables about Reynard are set forth had nightly increased, but only the oldest among those which have survived (which only reach back to about the beginning of the 13th c.) display a pure epic character. In 1826, M. Méon published a collection, in 4 vols., of the stories extant in Norman-French, under the title of *Le Roman du Renart*, to which M. Chabaille, in 1835, added *Suppléments*, with various readings and corrections. The *Renart li Contrefet*, of an unknown poet of Champagne, has only been partially printed. From such sources sprang the French chap-books (*Volksbücher*), which came into vogue after the 15th century. How popular the fable became in France may be estimated from the fact, that the German word *Reinhart* (old form, *Ruginhart*—i. e., 'bold' or 'cunning in counsel'), which merely designates the character of the Fox, has entirely superseded the old Franco-Latin word *goupil* (from the Latin *vulpes*). The Swabian court-poetry of Germany had little in harmony with the 'beast-fable,' which was little cultivated while the former continued to flourish.

In the Netherlands, on the other hand, it continued to keep its ground, but as the medieval spirit of poetry declined, it passed into prose—e. g., *De Historie van Reinaert de Vos*, published in Dutch at Gouda, in Holland, in 1479; which, in its turn, was translated into English in 1481 by William Caxton—*Hyer begyneth thystorye of Reynard the Foxe*; republished, with a few changes, by W. J. Thoms (Lond. 1844).—Thus have we sketched in meagre outline the history of the fable of Reynard the Fox in different countries, and from internal evidence it is clear, that the substance of the Low-German *Reineke Vos* of Hinreck van Alckmer or Hermann Burkhusen was derived from the Flemish sources already referred to. Its peculiarity consists in this, that it is the latest, best, and most complete of the whole series of poems about the Fox, gathered up into itself, as it were, whatever scattered merits its predecessors possess, and presenting the whole in epic unity for the pleasure and profit for all future ages. The work now consulted by general readers is Goethe's version, of which an excellent translation into English heroic verse was made by T. J. Arnold, with illustrations by J. Wolf (Lond. 1855). For a critical appreciation of the fable, see Carlyle's 'Essay on German Literature of the Fourteenth and Fifteenth Centuries' (*Miscellaneous Essays*).

REYNOLDS, SIR JOSHUA, P.R.A., is generally acknowledged to be at the head of the English school of painting; he was born on 16th July 1723. His father was the Rev. Samuel Reynolds, rector of Plympton, St. Mary, and master of the grammar-school of Plympton, Devonshire. He intended his son for the medical profession, but Joshua having manifested from an early age an ardent desire to be a painter, was, in 1741, placed under Hudson,

the principal portrait-painter of the day. After being in the studio of this artist two years, he commenced on his own account as a portrait-painter at Plymouth Dock, now Devonport, and met with great encouragement. In 1746, he went to London, and established himself in St. Martin's Lane; but on the appointment of Commodore Keppel to the Mediterranean station, he accepted an invitation to accompany him, sailed from Plymouth in 1749, and on his arrival in Leghorn proceeded to Rome. He remained about three years in Italy, most diligently employing his time in visiting the various cities where the chief art collections are to be found. On his returning to London in October 1752, his works attracted great attention, eclipsing everything that had been done there since Van Dyck's time. When the Royal Academy was instituted in 1769, he was elected President; was knighted by George III., and on Ramsay's death, in 1784, succeeded him as painter to the king. He died in his house in Leicester Square on 23d February 1793, and after lying in state at the Royal Academy, was interred in the crypt of St. Paul's.

Sir Joshua lived in friendly intercourse with Johnson, Burke, and the leading men of his period. His literary works consist of fifteen Discourses delivered in the Royal Academy; three essays contributed to the *Idler*, at Dr. Johnson's request; notes to Mason's translation of Du Fresnoy's *Art of Painting*; a few notes for Dr. Johnson's edition of Shakspeare; and notes of his tour through Flanders in 1781. In his writings, there is much valuable information on art, imparted in an admirable manner; but he has been charged with laying down in them various rules, and holding up the works of certain schools as models for the student, while he himself did not carry out these precepts in his practice as an artist; and from this an unfair inference has been drawn, that from love of gain he cultivated portrait-painting, the most lucrative branch of the profession, and recommended others to follow what is generally believed to be a more arduous but less remunerative path of art. But this accusation is most unjustly made—perhaps no other artist has handed down in writing so many practically useful maxims and observations on art. His works of this kind fortunately are numerous, and bear a very high value. There are nearly 700 engravings from R.'s pictures; most of them admirably rendered in mezzotint.—Northcote's *Life of Sir Joshua Reynolds* (3 vols. 8vo., Lond. 1819); Cunningham's *Lives of British Painters, Sculptors, and Architects* (Lond. 1854, vol. 1).

RHA-BDOMANCY. See DIVINING-ROD.

RHADAMA'NTHUS, a mythical personage, son of Zeus and Europa, and brother of Minos (q. v.). He settled in Bœotia, where he married Alcmena. So great was his reputation during life for the exercise of justice, that after his death he was appointed a judge in the under-world, along with Minos and Æacus. His special function was to sit in judgment on the actions of all those who came to Hades from Asia.

RHÆ'TIC BEDS, a series of strata forming the uppermost portion of the Trias (q. v.), which are extensively developed in the Rhetian Alps. The British beds referred to this group are more highly fossiliferous than any of the other members of the Triassic period.

RHAMNA'CEÆ, a natural order of exogenous plants, consisting of trees or shrubs; often spiny; with simple, generally alternate leaves, and stipules minute or wanting. The flowers are small, generally green. The calyx is 4—5 cleft; the petals distinct, hood-shaped, or convolute, inserted into the throat of the calyx, occasionally wanting. The stamens are equal in number to the petals, and opposite to them; the disc is fleshy; the ovary is superior, or half-superior, with two, three, or four cells; the ovules solitary. The fruit is fleshy, and does not open when ripe, or dry and separating into three parts. This order contains about 250 known species, natives of temperate and tropical countries, and very generally distributed over the globe. Some of them are used in dyeing (see BUCKTHORN and FRENCH BERRIES), some in medicine (see RED ROOT), and the fruit of some is pleasant (see JUJUBE); whilst *Hovenia dulcis*, a native of China and Japan, is remarkable for the thickening of its flower-stalks after flowering, so as to form a succulent sweet red pulp, with a flavor resembling that of a pear.

RHAPSINITUS, the Greek name of the Egyptian monarch Rameses III., first king of the 20th dynasty, and builder of the great palace at Medinat Habu. According to Herodotus, he placed two colossal statues of 25 cubits high in front of the west vestibule of the Hephæsteum at Memphis. He was the richest of Egyptian kings, having amassed 400,000 talents, or £77,500,000—an incredible sum for that period. This wealth was, however, probably in jewels as well as the precious metals, for both are recorded on the walls of the treasury of Medinat Habu. To secure this enormous treasure, he built a treasury of stone, one side of which adjoined the wall of his palace. In connection with this, is narrated a story which rather resembles the tale of Ali Baba in the *Arabian*

Nights than the sober narrative of history. The story was told by the Egyptian dragomen of the days of the Persians to the Father of History, who naively doubts its veracity; but notwithstanding some of the German researches, which attempt to connect it with Hellenic myths of the brothers Agamenes and Trophonios, it is believed to be essentially Egyptian. R. is said to have descended to Hades, and to have played at draughts with Isis, or Ceres, and he is so represented on the walls of his palace at Medinat Habu. His return was celebrated as a festival. Herodotus, who has inverted and confused the whole history of Egypt, calls R. the son of Proteus, and predecessor of Cheops, placing him 16 dynasties earlier than he should be. According to Lepsius, he reigned about 1275 B.C. According to Diodorus, R. was called Remphis, or rather Rempsis (Ramses), and by Pliny Ramses, in whose reign Troy was taken.

Pliny, *Hist. Nat.*, xxxvi. 8, 14, 2; Herodotus ii. 121—124; Diodorus, i. 62; Champollion, *Not. Descr.*; Burton, *Ezra. Hier.*; Sir G. Wilkinson, *Manners and Customs*, i. p. 121, and foll.; Lepsius *Einleit.* p. 299, and foll.

RHAPSODISTS (from Gr. *rhapto*, to string together, and *ode*, a song), in ancient Greece, were a class of persons who earned their bread by going about from place to place, reciting, in a sort of musical chant, the epic ballads of Homer and other ancient poets. They may be compared with the wandering minstrels of the middle ages; but there is this important difference, that the latter were generally the authors of the compositions which they sung. The R. were long a respected and venerated body, but lost their importance, and consequently their character, when the Homeric songs, after being written down, and perhaps woven together into their present form by the scholars at the court of Peisistratus, became generally known to the Greek world through the medium of manuscript copies. Each ballad, or at least as much as could conveniently be remembered and recited at one time, was termed a 'rhapsody,' whence the application of the term to the separate books of the *Iliad* and *Odyssey*, in which usage it is equivalent to the *Fytte* or *Canto* of Scott and Byron.

RHATANY ROOT. See **RATTANY ROOT.**

RHE'A. See **NANDU.**

RHEEA FIBRE, an exceedingly valuable East Indian fibrous material, produced by one of the nettle tribe, *Urtica tenacissima*, found indigenous in Assam. It is very nearly like the fibre of which the Chinese make their celebrated *grass cloth*, or linen, and excepting that there are at present some difficulties in preparing it, it would at once become one of the most useful and most abundant of textile fibres; large quantities have already been imported into Britain, and it is gradually getting into use.

RHEIMS, or **REIMS**, a city and archiepiscopal see in the department of Marne, France, situated on the Vesle (a tributary of the Aisne), 107 miles east-north-east of Paris, by the Paris and Strasbourg Railway. R., a very ancient city is built on the site of *Durocotorum*, which is mentioned by Julius Cæsar (*De Bello Gallico*, vi. 44) as the capital of the Remi, from which people it subsequently took its present name. Christianity may have found an entrance into R. at an earlier period, but it was not till the middle of the 4th c., that it became a bishop's see. Under the Frank rule it was a place of much importance, and it acquired a deeply religious interest from its having been the scene of the baptism of Clovis and his chief officers by the bishop, St. Remy in 496. In the 8th c., it became an archbishopric, and from the 12th c., (in 1179, in which year Philip Augustus was there solemnly crowned), it became the place for the coronation of the kings of France down to the time of Charles X., a vessel of sacred oil, called *la Sainte Ampoule*, to which a miraculous origin was ascribed, being preserved for the purpose. The only sovereigns in the long series, down to the Revolution of 1830, not crowned at R. were Henry IV., Napoleon I., and Louis XVIII. During the frenzy of the Revolution, the cathedral was attacked by the populace; and the sainte ampoule destroyed, in detestation of royalty; and in 1830, the ceremony of coronation at R. was abolished. R. is one of the principal entrepôts for the wines of Champagne, and the hills which surround the town are planted with vineyards. It is one of the great centers of the woollen manufacture in France, and its manufactures, embracing woollen goods, mixed fabrics in silk and wool, merinoes, &c., are known in commerce as *Articles de Reims*.

The town is well built, and from the material employed in building, which is the chalk-stone of the district, and from the prevalence of the older style of domestic architecture, has a picturesque appearance. Its most striking public building is the cathedral, which, although it still wants the towers of the original design, is one of the finest extant specimens of Gothic architecture. It was built in the first half of the 13th century. Its nave is 466 feet long by 99 in breadth, with a transept of 160 feet, and the height is 144 feet. Its grandest features are the western front, which is almost unrivalled, and the so-called

Angel Tower, which rises 59 feet above the lofty roof. The stained glass is remarkable for its beauty; the baptismal fonts also are of exquisite workmanship, and the organ is reputed one of the finest in France. The church of St. Remy is of greater age, and nearly of equal size, but it is of less architectural pretension. The archiepiscopal province of R. comprises the sees of Soissons, Chalons, Beauvais, and Amiens. Pop. (1881) 93,344.

RHEINGAU, a district stretching along the right bank of the Rhine, formerly belonging to the archbishopric of Mainz, now forms the administrative district of Wiesbaden, in the Prussian province of Hessen-Nassau. R. is about 12 miles long, and 6 broad. This district, one of the richest in Germany, protected by mountains from the north and east winds, and exposed to the mid-day sun, produces wines of the best quality.

RHEIN-HESS. See **HESS-DARMSTADT.**

RHENISH ARCHITECTURE, the style of the countries bor-

Fig. 1.—Plan of Church at Laach.

dering on the Rhine when the arts first revived after the fall of the Roman empire. Being, at the time of Charlemagne, part of the same empire with Lombardy, the arts of that country (see **LOMBARD ARCHITECTURE**) soon spread northwards, and similar buildings sprang up north of the Alps. There are almost no traces of architecture in Germany before the time of Charlemagne. It re-

Fig. 2.—Elevation of Church at Laach.

ceived great encouragement from him and his successors, and the Rhenish style made great progress up to the beginning of the 13th c., when the fashion of copying the Gothic architecture of France superseded it. It is, however, a well-marked style, and is complete and perfect in itself. Like the Lombard style, it is round-arched, and has some remarkable peculiarities. The earliest

churches seem to have been all circular (like the Dom at Aix-la-Chapelle, built by Charlemagne), and when this was abandoned, the circular church was absorbed into the Basilica, or rectangular church (see ROMANESQUE ARCHITECTURE), in the form of a western apse. Most German churches thus have two apses—an eastern and a western. They also have a number of small circular or octagonal towers, which seem to be similar in origin to the Round Towers of Ireland. They exemplify in a remarkable manner the arrangements of an ancient plan of the 9th c., found in the monastery of St. Gall, and supposed to have been sent to the abbot, as a design for a perfect monastery, to aid him in carrying out his new buildings.

The arcaded galleries at the eaves, and the richly carved capitals, are among the most beautiful features of the style. Examples are very numerous from about 1000 to 1200 A. D. The three great types of the style are the cathedrals of Mainz, Worms, and Speyer. The last is a magnificent building, 435 feet long by 125 feet wide, with a nave 45 feet wide, and 105 feet high. It is grand and simple, and one of the most impressive buildings in existence. There are also numerous fine examples of the style at Cologne—the Apostles' Church, Sta. Marie in Capitulo, and St. Martin's being amongst the most finished examples of Rhenish architecture. The illustrations of the church at Laach explain the peculiarities of plan and elevation above referred to. It will also be observed that there is a paradise or pavis in front of the entrances. The vaults in this case being small, the different spans were managed (although with round arches) by tilting the springing; but in great buildings like Speyer and Worms, the vaults are necessarily square in plan, in this round-arched style, and the nave embraces in each of its bays two arches of the side aisles—a method also followed by the early Gothic architects. From the use of the round arch and solid walls, the exteriors are free from the great mass of buttresses used in Gothic buildings, and the real forms are distinctly seen.

RHENISH PRUSSIA (Ger. *Rheinprovinz*, or *Rheinpreussen*), the most western and most thickly peopled of the provinces of Prussia lies along the banks of the Rhine, and is bounded on the W. by Belgium and the Netherlands. Area, 10,400 sq. m.; pop. (1880) 4,074,000, of whom about 2,950,000 are Catholics, half-a-million are of Flemish blood, and 11,000 are Walloons. In the south, the surface is mountainous, the principal ranges being the Hunsrück, the Eifelgebirge, and branches of the Westerwald. The largest river is the Rhine, which flows through the province in a north-north-west direction for 200 miles, and receives many affluents from left and right. The surface is everywhere more or less mountainous, except in the extreme north, and the soil of the higher mountain-tracts barely supports the inhabitants; while that of the valleys of the Rhine, Moselle, and Nahe are very fruitful, and the flat districts in the north are most productive in grain. Timber and minerals, including lead, copper, zinc, coal, &c., and; and the warm and hot sulphur springs of Aix (q. v.) and Bartscheid (q. v.) have a European reputation. Industries and manufactures are here prosecuted with the utmost energy, and with great success. The cotton manufactures of the Wuppertal, the silk manufactures of Krefeld and vicinity, and the woollen cloth and Cashmere manufactures of the district of Aix, are famous. R. P. came into the possession of Prussia by the treaty of Vienna in 1815. It consists of the former duchies of Cleves, Gelders, and Berg, of the principalities of Mörs and Lichtenberg, the northern and middle parts of the former archbishopric of Cologne, numerous lordships, portions from the four French departments of Rhein-Mosel, Mosel, des Forêts, and Saar, &c.

RHE'SUS MONKEY (*Macacus Rhesus*), an Indian monkey, ex-

Rhesus Monkey (*Macacus Rhesus*).

tending further north than any other species except the Entellus (q. v.), or Honuman, and, like it, partially migratory, visiting regions of the Himalaya in summer, which are far too cold for it in winter. It is held in almost as great veneration by the natives of India as the Honuman itself; and the killing of one of these animals is apt to arouse the greatest popular indignation. The monkeys live in troops in the forests, chiefly in hilly districts, and visit the cultivated grounds to carry away grain and other produce, which they store up for themselves among rocks. The

native farmers leave a share for the monkeys, believing this to be necessary for the averting of their anger, as otherwise, next year, they would destroy the whole crop whilst green. The R. M. has a stout form, stout limbs, short ears, a short tail, large callosities, the skin hanging loose about the throat and belly, the hair rather long, the back brownish, the lower part of the back and the haunches bright chestnut, or almost orange, the shoulders and arms lighter. It is one of the most intelligent and mischievous of monkeys.

RHETORIC (Gr. *rhetorike*, from *rhetor*, an orator) in its broadest sense may be regarded as the theory of eloquence, whether spoken or written. It aims at expounding the rules which should govern all prose composition or speech designed to influence the judgments or the feelings of men, and therefore treats of everything that relates to beauty or force of style—e. g., accuracy of expression, the structure of periods, and figures of speech. But in a narrower sense rhetoric concerns itself with a consideration of the fundamental principles according to which particular discourses of an oratorical kind are composed. The three chief elements of an oration are usually held to be—*inventio*, or the discovery of proper ideas; *dispositio*, or their arrangement; and *elocutio*, or the style in which they are expressed. The ancients, however, who cultivated oral eloquence more than the moderns do, reckoned other two—viz., *memoria*, or memory, and *actio*, or gesticulation. The most distinguished writers on rhetoric in ancient times were Aristotle, Cicero, and Quintilian; in modern times, Blair, Campbell, Whately, and Spalding among the English; Erneste Maass, Schott, Richter, and Felkmann among the Germans; and among the French, Rollin, Gilbert, Le Batteux, La Harpe, Marmontel, and Andrieux.

RHEUMATISM (from the Gr. *rheuma*, a flux) is a blood-disease in which inflammation of the fibrous tissues is the most marked characteristic. It occurs either as an acute or as a chronic affection; there is, however, no distinct line of demarcation between the two, and the latter is often a consequence of the former.

Acute rheumatism is indicated by general febrile symptoms, redness, heat, swelling, and usually very intense pain, in and around one or more (generally several, either simultaneously or in succession) of the larger joints, and the disease shows a tendency to shift from joint to joint or to certain internal fibrous membranes, and especially the pericardium; rheumatism being the most common origin of pericarditis, as has been already shown in the article on that disease. The pulse is strong and full, there is headache, but seldom delirium, unless the heart is affected; the tongue is covered with a creamy thick fur, the tip and edges being red; the urine is turbid, and abnormally acid; and the skin is bathed in a copious perspiration, with so characteristic a smell (resembling that of sour-milk), that the physician can often recognize the disease almost before he sees the patient. The joints are extremely painful, and the pain is much increased by pressure, and consequently by movement which gives rise to internal pressure. Hence the patient lies fixed in one position, from which he dares not stir. There are two varieties of acute rheumatism. In one, the inflammation commences not in the joint, but near it, and attacks the tendons, fasciæ, ligaments, and possibly the muscles themselves. This form is termed *fibrous* or *diffused* rheumatism. In the other variety, the synovial membrane in the joint becomes affected, and an excess of fluid is poured into the joint, distending the membrane, and making it bulge out between the spaces intervening between the various tendons, ligaments, &c., round the joint. It is the knee-joint which is most commonly affected in this way, and fluctuation may readily be perceived on applying the hands to the two sides of the knee. In this form, which is called *synovial* rheumatism, the swelling and redness come on sooner, and are more marked than in the former variety. The fibrous is by far the most severe form, and it is to it that the previous sketch of the most marked symptoms chiefly applies. In the synovial form, the fever is less intense, the tongue less foul, the perspiration far less profuse, and the membranes of the heart are much less liable to be attacked. It is to this form that the term *rheumatic gout* is often applied, and it is by no means inappropriate, because synovial rheumatism forms (as Dr. Watson has observed) a connecting link between gout and rheumatism, and partakes of the characters of both.

The only known exciting cause of acute rheumatism is exposure to cold, and especially to cold combined with moisture, and hence the greater prevalence of this disease amongst the poor and ill-clad. Sleeping in damp sheets or upon the damp ground, the wearing of wet clothes, and sitting in a cold damp room, especially if the sitter was previously warm from exercise, are examples of the kind of exposure which is apt to be followed by this disease. The excreting power of the skin being checked by the action of cold, certain effete matters which should be eliminated in the form of perspiration, are retained, and accumulate in the

blood, which thus becomes poisoned. This blood-poisoning is not, however, a universal sequence to exposure to the cold. It only occurs when there is a special predisposition to this disease, or, as it is termed, a rheumatic diathesis or constitution, and the diathesis may be so strongly developed as to occasion an attack of acute rheumatism, independently of exposure to any apparent exciting cause. Men are more subject to the disease than women, but this probably arises from their greater exposure to atmospheric changes from the nature of their occupations. The predisposition is certainly affected by age; children under ten years, and adults over sixty, being seldom attacked, while the disease is most prevalent between the age of fifteen and forty. Persons once affected become more liable to the complaint than they previously were. Dr. Fuller believes, from his observations made in St. George's Hospital, that the disease is sometimes hereditary; whether this be the case or not, there can be no possible doubt that the predisposition is very apt to exist in members of the same family. The exact nature of the poison is unknown. The late Dr. Prout regarded lactic acid as the actual *materies morbi*, and certain experiments recently made by Dr. Richardson tend to confirm this view.

The danger in cases of acute rheumatism arises almost entirely from the disease going from the joints to the heart, and setting up Pericarditis (q. v.). Hence that mode of treatment will be best which tends most surely to prevent, or, at all events, to lessen the risk of this complication. If the patient is a young person of robust constitution, and there are well-marked inflammatory symptoms (such as a flushed face and a bounding pulse), he should be at once bled from the arm. A large quantity of blood can usually be taken before any signs of faintness occur, and the bleeding is serviceable in at least three points of view. In the first place, it almost always mitigates the pain, and diminishes the febrile symptoms; secondly, it enables other remedies, as calomel, opium, colchicum, &c., to act more efficiently; and thirdly, it may occasionally cut short the attack of the disease, which, if not arrested by treatment, may run on for six weeks, two months, or even longer. Unfortunately, however, the cases of rheumatism which are fit to bear free venesection are comparatively few, especially in large towns; and further, it often happens that the physician is not called in till the proper time for free depletion is past. Purging is probably almost as efficacious as blood-letting, at the beginning of the disease. From five grains to a scruple of calomel given every night, and followed in the morning, for three or four days in succession, by an ordinary black draught, will sometimes dislodge an enormous amount of dark and foul secretions from the liver and bowels, and give marked relief. The main drawback to this mode of treatment is the pain occasioned by changing the position when the bowels act; but this may be to a great extent obviated by the use of the bed-pan. Opium (or morphia) is one of the most valuable remedies in this disease, from its power of allaying pain and procuring sleep.

Dr. Corrigan of Dublin trusts to opium alone for the cure. He begins with one grain, and repeats that quantity (or a larger dose if necessary) at intervals of two hours, until the pain disappears. He found twelve grains in the twenty-four hours to be the average amount required; but half that quantity (or even less) will generally suffice, if the opium be combined with other remedies, as, for example, if it be given with ipecacuanha (as in Dover's Powder), or with small doses of calomel. Colchicum sometimes has a marvelous effect in subduing the disease, but it must be given with extreme care, in consequence of the prostration to which an over-dose gives rise. See POISONS. Dr. Watson believes that this remedy is of most value when synovial symptoms are present, or when, in other words, the rheumatism approaches in its characters to gout. 'Large doses,' he observes, 'are not requisite. Twenty minims of the wine or of the tincture may be given every six hours until some result is obtained.' The abnormal acidity of the various fluids (the sweat, urine, and even the saliva) in acute rheumatism has led to the belief, that alkaline remedies would both neutralize the poison, and, from their diuretic properties, tend to eliminate it. The bicarbonate of potash in solution has been largely tried by Dr. Garrod, who administered it in average doses of two scruples every two hours, by night and day, for several days together. Of 51 cases so treated, the average period of treatment was between six and seven days, and the average duration of the disease was slightly under a fortnight. The medicine soon rendered the urine alkaline, but did not irritate either the bladder or the intestines. It seemed rapidly to calm the pulse and to allay the febrile heat; and in no case did any heart-complication arise after the patient had been forty-eight hours under its influence. Other physicians, including the late Dr. Golding Bird, prefer the acetate of potash.

The mode of treatment by lemon-juice in doses of one or two ounces five or six times a day, originally advocated by Dr. G. O. Rees, at first sight seems in direct antagonism to the alkaline mode of treatment. As, however, the most active principle in

the lemon-juice is citrate of potash, which, before it reaches the kidneys, becomes converted into carbonate of potash, there is less essential difference between the acid and the alkaline mode of treatment than at first sight seems to be the case. Some years ago, a new and wholly different mode of treating acute rheumatism was warmly advocated by Dr. Davies of the London Hospital. It mainly consists in the application of a series of blisters to the parts surrounding and adjacent to the affected joints. One of our highest authorities on this disease, Dr. Fuller of St. George's Hospital, after trying various hot external applications, finds that a mixed alkaline and opiate solution is far more powerful than any other in allaying acute rheumatic pain. The solution which he now usually employs is made by dissolving half an ounce (or rather more) of carbonate of potash or soda in nine ounces of hot water, and adding six fluid drachms of Battley's *Liquor opii sedativus*. This fannel, soaked in this hot lotion, is applied to the affected joints, and the whole is wrapped in a covering of thin gutta-percha.

Cases which are intermediate between acute and chronic rheumatism are of very common occurrence. In those cases of what may be termed *subacute* rheumatism, there is slight fever, and several joints are usually affected, without intense inflammation in any one joint. These cases soon show signs of amendment under mild alkaline treatment, as, for example, a drachm of liquor potassæ daily, well diluted and divided into three or four doses, and the moderate use of purgatives.

In all cases of acute and subacute rheumatism, the heart-sounds should be examined daily, or even oftener, with the view of detecting the earliest trace of cardiac affection, and, if possible, of checking its further development. For the treatment to be adopted when there is evidence that the membranes of the heart are affected, the reader is referred to PERICARDITIS (q. v.).

There are two kinds of *chronic rheumatism*, which are sufficiently distinct to require notice. In one there is considerable local heat and swelling, although unaccompanied with any corresponding constitutional disturbance; while in the other the patient complains of coldness (rather than heat) and stiffness of the affected joints. The former approximates most closely to the previously described forms of rheumatism, of which it is frequently the sequel, and must be treated in a similar manner; while the latter, which is termed by some the *passive* form, usually occurs as an independent affection. In passive rheumatism, the pain is relieved by friction, and the patients are most comfortable when warm in bed—conditions which increase the pain in the former variety. Patients of this kind derive benefit from living in a warm climate, from warm clothing, warm bathing, especially in salt water at a temperature of not less than 100°, the hot-air bath, &c. Friction with some stimulating liniment, and the peculiar manipulation known as shampooing, are here of service; and amongst the internal remedies, turpentine, cod-liver oil, sulphur, guaiacum, sarsaparilla, and Dover's Powder possess a high reputation. Dr. Fuller recommends the muriate of ammonia as a remedy of 'singular efficacy;' but of all remedies for this affection there can be little doubt that the most efficacious is the iodide of potassium, given in five-grain doses, combined with a few grains of carbonate of ammonia three times daily. A patient who is liable to attacks of chronic rheumatism should always wear flannel next the skin during the day, and at night he should sleep between the blankets, abjuring altogether the use of sheets.

RHEUMATIC DISEASES are less common in the lower animals than in men. Horses are not very liable to acute rheumatism, but suffer from a chronic variety, which occurs especially in conjunction with influenza. When affecting the limbs, it often exhibits its characteristic tendency to shift from one part to another. In cattle and sheep, rheumatic disorders are more common and acute than in horses. The specific inflammation sometimes involves most of the fibrous and fibro-serous textures throughout the body, inducing general stiffness, constipated bowels, and high fever. This is rheumatic fever—the *cline-felon* or *body-garget* of the old farriers. Sometimes the disease mainly affects the larger joints, causing intense pain, lameness, and hard swellings; occasionally it is confined to the feet and fetlocks, when it is recognized as *bustian-foul*. Cattle and sheep on bleak exposed pastures, and cows turned out of the dairy to feed on strong alluvial grazings, are especially subject to rheumatism in its several forms. Amongst dogs, rheumatism is known under the name of *keuel* lameness, and is very troublesome and intractable in low, damp, cold situations. Blood-letting is rarely admissible except in the most acute cases amongst cattle. In all animals, a laxative should at once be given, with some saline matters and colchicum, and when the pain and fever are great, a little tincture of aconite may be added. For cattle, a good combination consists of one ounce of nitre, two drachms of powdered colchicum, and two fluid drachms of the Pharmacopœia tincture of aconite, repeated in water or gruel every three hours; half this dose will suffice for horses. With a simple laxative diet, dogs should have a pill night and morning containing five grains of nitre and two of col-

chicum. Comfortable lodgings, a warm bed, horse-rugs on the body, and bandages on the legs, will greatly expedite a cure. In chronic cases, or after the more acute symptoms are subdued, an ounce of oil of turpentine, and two drachms each of nitre and powdered colchicum, should be given for a cow, half that quantity for a horse, and one-fourth for a sheep. Hartshorn and oil, or other stimulating embrocations, diligently and frequently rubbed in, will often abate the pain and swelling of the affected joints.

RHEYDT, a town of Rhenish Prussia, on the left bank of the Niers, and on the railway between Düsseldorf and Aix-la-Chapelle, 14 miles west-by-south from Düsseldorf. It has manufactures of silks and velvets, soap, glue, vinegar, and leather; it has also dyeworks, and some trade in linen. Pop. (1880) 15,087.

RHIME, or **RHYME**, is more properly, perhaps, written *rima*, as it does not seem to be derived from the Greek *rythm*, but to be a native Teutonic word, from the same root, probably, as Ger. *reihe*, a row, verb *reihen*, to array; also *reihen*, a song or a chain-dance, of which *reim* may be only a variety. In Ang.-Sax., *rim-craeft*, meant the art of numbering; *riman*, to number; and thus *rima*, although a native Teutonic word, may ultimately be from the same Aryan root as the Greek *Rythm* (q. v.), which etymologists derive from *rheo*, to flow. In early English, rhyme (and the same is true of Ger. *reim* and the other forms of the word in other northern tongues as well as in the Romance) meant simply a poem, a numbered or versified piece (compare Lat. *numeri*, numbers = verses, versification); but it has now come to signify what is the most prominent mark of versification in all these tongues, namely, the recurrence of similar sounds at certain intervals. As there may be various degrees and kinds of resemblance between two syllables, there are different kinds of rhyme. When words begin with the same consonant, we have *Alliteration* (q. v.), which was the prevalent form of rhyme in the earlier Teutonic poetry (e. g., Anglo-Saxon). In Spanish and Portuguese, there is a peculiar kind of rhyme called *Assonance*, consisting in the coincidence of the vowels of the corresponding syllables, without regard to the consonants; this accords well with the character of these languages, which abound in full-toned vowels, but is ineffective in English and other languages in which consonants predominate.

In its more usual sense, however, rhyme denotes correspondence in the final syllables of words, and is chiefly used to mark the ends of the lines or verses in poetry. Complete identity in all the parts of the syllables constitutes what the French call *rich* rhyme, as in *modèle, fidèle; beauté, santé*. But although such rhymes are not only allowed but sought after in French, they are considered faulty in English, or rather as not true rhymes at all. No one thinks of making *deplore* rhyme with *explore*. Rhyming syllables in English must agree in so far, and differ in so far; *the vowel and what follows it—if anything follow it—must be the same in both; the articulation before the vowel must be different*. Thus, *mark* rhymes with *lark, bark, ark*, but not with *remark*. In the case of *mark* and *ark*, the absence of any initial articulation in the last of the two makes the necessary difference. As an example of rhyme where nothing follows the vowel, we may take *be-love*, which rhymes with *fore-go*, or with *O!* but not with *lo*. To make a perfect rhyme, it is necessary, besides, that the syllables be both accented; *free* and *merrily* can hardly be said to rhyme. It is almost needless to remark, that rhyme depends on the sound, and not on the spelling. *Plough* and *enough* do not make a rhyme, nor *ease* and *decease*.

Such words as *roaring, de-ploring*, form *double* rhymes; and *an-nuity, gra-tuity, triple* rhymes. In double or triple rhymes, the first syllable must be accented, and the others ought to be unaccented, and to be completely identical. In the sacred Latin hymns of the middle ages, the rhymes are all double or triple. This was a necessity of the Latin language, in which the inflectional terminations are without accent, which throws the accent in most cases on the syllable next the last—*do-lorum, vi-rorum; sup-plexia, con-vicia*.

Although rhymes occur chiefly between the end-syllables of different lines, they are not unfrequently used within the same line, especially in popular poetry:

And then to see how ye're neglectit.
How huff'd, and cuff'd, and disrespektit.
Burns.

And ice mast-high came floating by.
Coleridge.

(See **LEONINE VERSES**.)

When two successive lines rhyme, they form a *couplet*; three form a *triplet*. Often the lines rhyme alternately or at greater intervals, forming groups of four (*quatrains*) or more. A group of lines embracing all the varieties of metre and combinations of rhyme that occur in the piece, forms a section called a *stave*, sometimes a *stanza*, often, but improperly, a *verse*. In the days of Acrostics (q. v.) and other conceits, it was the fashion to interlace rhymes in highly artificial systems; the most complex arrangements still current in English are the Sonnet (q. v.) and the

Spenserian (q. v.) stanza. Tennyson has accustomed the English ear to a quatrain, in which, instead of alternate rhymes, the first line rhymes with the fourth, and the second with the third.

It is a mistake to suppose that rhyme is a mere ornament to versification. Besides being in itself a pleasing musical accord, it serves to mark the endings of the lines, and other sections of the metre, and thus renders the Rhythm (q. v.) more distinct and appreciable than the accents alone can do. So much is this the case, that in French, in which the accents are but feeble, metre without rhyme is so undistinguishable from prose, that blank verse has never obtained a footing, notwithstanding the war once waged by French scholars against rhimed versification. 'The advantages of rhyme,' says Guest (*English Rhythms*), 'have been felt so strongly that no people have ever adopted an accentual rhythm without also adopting rhyme.' The Greek and Latin metres of the classic period, depending upon time or quantity, and not upon accent, were able to dispense with the accessory of rhyme; but as has been well observed by Trench (*Sacred Latin Poetry, Introduction*, 1864), even 'the prosodic poetry of Greece and Rome was equally obliged to mark this (the division into sections or verses), though it did it in another way. Thus, had dactyls and spondee been allowed to be promiscuously used throughout the Hexameter (q. v.) line, no satisfying token would have reached the ear to indicate the close of the verse; and if the hearer had once missed the termination of the line, it would have been almost impossible for him to recover it. But the fixed dactyl and spondee at the end of the line answer the same purpose of strongly marking the close, as does the rhyme in the accentuated verse; and in other metres, in like manner, licenses permitted in the beginning of the line are excluded at its close, the motives for this greater strictness being the same.' It is chiefly, perhaps, from failing to satisfy this necessary condition, that modern unrhimed verse is found unsatisfactory, at least for popular poetry; and it may be doubted whether it is not owing to the classical prejudices of scholars that our common English blank verse got or maintained the hold it has.

The objection that rhyme was 'the invention of a barbarous age, to set off wretched matter and lame metre,' rests on ignorance of its real history. It cannot be considered as the exclusive invention of any particular people or age. It is something human, and universal as poetry or music—the result of the instinctive craving for well-marked recurrence and accord. The oldest poems of the Chinese, Indians, Arabians, &c., are rhimed; so are those of the Irish and Welsh. In the few fragments of the earliest Latin poetry that are extant, in which the metre was of an accentual, not quantitative kind, there is a manifest tendency to terminations of similar sound. This native tendency was overlaid for a time by the importation from Greece of the quantitative metres; yet even under the dominance of this exotic system, rhiming verses were not altogether unknown; Ovid especially shows a liking for them:

Quot celum stellas, tot habet tua Roma puellas;

and in the decline of classicism they become more common. At last, when learning began to decay under the irruptions of the northern nations, and a knowledge of the quantity of words—a thing in a great measure arbitrary, and requiring to be learned—to be lost, the native and more natural property of accent gradually reappeared as the ruling principle of Latin rhythm, and along with it the tendency to rhyme. It was in this new vehicle that the early Christian poets sought to convey their new ideas and aspirations. The rhymes were at first often rude, and not sustained throughout, as if lighted upon by chance. Distinct traces of the adoption of rhyme are to be seen as early as the hymns of Hilary (died 368), and the system attained its greatest perfection in the 12th and 13th centuries. In refutation of the common opinion, that the Latin hymnologists of the middle ages borrowed the art of rhyme from the Teutonic nations, Dr. Guest brings the conclusive fact, that no poem exists written in a Teutonic dialect with final rhyme before Otfried's *Evangelij*, which was written in Frankish about 870.

Alliteration had previously been the guiding principle of Teutonic rhythms; but after a struggle which was longer protracted in England than on the continent, it was superseded by end-rhymes.—See Guest's *History of English Rhythms* (2 vols., Lond. 1888); where the whole subject is learnedly and elaborately treated; Trench's *Sacred Latin Poetry, Introduction* (Lond. 1864); F. Wolf, *Ueber die Laus Sequenzen, und Leiche* (Heid. 1841).

RHIN, BAS (LOWER RHINE), formerly a frontier department of France, and corresponding pretty nearly to the present German administrative district of Lower Alsace (*Nieder-Elsass*) in the imperial territory of Alsace-Lorraine. To the east lies Baden, and to the west are the French departments of Moselle, Meurthe, and Vosges. The area of Bas-Rhin, as a department of France, was 1759 sq. miles, and its pop. in 1866 was 609,987; the area of Lower Alsace is 1841 sq. m., and its pop. in 1880, 612,015. This district lies almost wholly within the basin of the Rhine, which

flows north along its eastern border. The eastern portion of the district lying along the left bank of the Rhine, consists wholly of plains; while in the west are the rugged and wooded heights which form the eastern slopes of the Vosges Mountains. In the hilly regions are many beautiful valleys. The winters are long and cold; the summer variable; the autumns always fine. Cretinism and goitre prevail in some parts, though to a less extent now than formerly. The country is unusually rich in agricultural and manufacturing resources and capabilities. A great variety of grains, fruits, and vegetables, including fine crops of hemp and tobacco, are grown extensively; and wines, red, and white, the latter held in the highest estimation, are produced abundantly. Manufactures, textile and other, are carried on on a grand scale.

Spinning-mills, weaving factories for cotton, calico, woollen, and other fabrics, are exceedingly numerous, and foundries, arms and machine factories also abound. Some timber, floated down the Rhine in rafts, is exported. The region recently occupied by the French departments of Haut-Rhin and Bas-Rhin constituted, prior to the treaty of Ryswick in 1697, one of the most densely peopled and industrious portions of Germany, called in German, *Elsass* (Latin *Alsatia*). Ceded then to France, it became the French province of Alsace, which was at the Revolution subdivided into the two departments. So it remained till, in 1870, during the war between France and Germany, Bas-Rhin and Haut-Rhin were, with portions of the departments of Moselle, Meurthe, and Vosges, erected by the king of Prussia into the German general government of Alsace. When peace was concluded at Frankfurt, the repossessed German territory was not incorporated with any of the German states; but, certain portions having been restored to France, formed a member of the new German Empire, with the title of the imperial territory (*Reichsland*) of Alsace-Lorraine (*Elsass-Lothringen*).

RHIN, HAUT (UPPER RHINE), formerly a frontier department in the east of France, now for the most part comprehended within the German district of Upper Alsace. The area of Haut-Rhin was 1586 sq. miles, and its population in 1866 was 530,285; the area of Upper Alsace being 1354 sq. miles, and its pop. (1880) 461,942. The eastern frontier is for the most part formed by the Rhine, and the western frontier by the Vosges Mountains. After the Rhine, the principal river is the Ill, into which the streams from the Vosges Mountains flow. In the middle of the district the soil is fertile, and of the valleys of the west some are exceedingly rich and productive. The vineyards are extensive, and much wine is produced. In agriculture, and in trade and manufactures, great activity and enterprise are manifested. At the treaty of Frankfurt, the cantons of Belfort, Delle, Giromagny, with 28 other communes, all formerly included in Haut-Rhin, were restored by Germany. The French remnant was then called 'Territory of Belfort,' but since 1878 is again H.-R.

RHINA'NTHUS, a genus of plants of the natural order *Sorophulariaceae*, having an inflated 4-toothed calyx; the upper lip of the corolla compressed laterally, furnished on both sides below the tip with a straight tooth or lobe, the lower one plane and 3-lobed. The capsule is compressed and 2-celled. *R. cristata-galli* is a very common British plant, an annual, 1—2 feet high, to be seen in almost every meadow and in many pastures, with yellow flowers, and rather large capsules, in which the seeds rattle when ripe, whence its common name, *Yellow Rattle*. It is also called *Cock's-comb*, from its fringed bracts.

RHINE (*Rhenus*), the most important river in Germany, and one of the most noted in Europe, takes its rise in the Swiss canton of the Grisons, and after a north-north-west course of about 850 miles falls into the German Ocean. The area of the R. basin, including its various feeders, which have been counted to the number of 12,000, is estimated at about 86,000 sq. miles. The R. divided into the Upper, Middle, and Lower R., the first of these terms being applied to the river from its source to Basel; the second applies to its course from Basel to Cologne; and the last to its course from Cologne through the Netherlands to the sea, into which it empties itself by several mouths, forming an extensive delta. The head-waters of the Upper R. consist of three main streams called respectively the Vorder R., the Mittler R., and the Hinter Rhine. The first and most easterly rises on Mount Crispalt, north-east of Mount St. Gothard, 7500 feet above the level of the sea, and flowing east, bursts like a torrent through a deep ravine.

At Dissentis, 12 miles from its source, it is joined by the Mittler R., or central branch, at the comparative low level of 3500 feet. At Reichenau, 50 miles from the source of the Vorder R., the stream is swelled by the third branch, known as the Hinter R., which, taking its rise among the glaciers of the Vogelberg, flows over a distance of 80 miles before it blends its waters with the main branches. The Hinter R., considerably the longest of the upper waters, claims to be esteemed the chief source, and at its confluence with the other branch at Reichenau, the river first assumes the general name of Rhine. At Coire, where the river

takes a sudden turn northward, it is nearly 150 feet wide, and navigable for rafts and flat boats. A little above the small town of Sargans, in St. Gall, it leaves the Grisons, and forming the boundary between the small principality of Lichtenstein and the Voralberg, on the right, and St. Gall on the left, flows in a northerly direction to Rheineck, where it enters the Boden See, or Lake of Constance, which may indeed be regarded as the river itself, augmented in its course between Rheineck and Constance by the confluence of numerous streams. Emerging from the Upper Lake at Constance, the R. enters the Unter See, or Lower Lake, a few miles below, and following a westerly course, forms the boundary-line between Switzerland and the grand duchy of Baden; and after receiving the Thur, Töss, and Aar on the left, and the mountain torrents of the Wutach and Alb on the right, pursues its course to Basel. At Schaffhausen, about 13 miles from the western extremity of the Unter See, the waters of the river, rushing over a rock 70 feet high, form the cataract known as the Falls of Schaffhausen; while lower down the narrowing of the channel through the projection of rocks on either side gives rise to rapids both at Laufenburg, and at a point ten miles below it, known as Höllenhacken, where the navigation is impeded for a considerable distance by the force of the cataracts.

Below Basel, the R., turning again due north, separates Alsace-Lorraine from Baden, forms the eastern boundary of Rhenish Bavaria, cuts the province of Rhine-Hesse in two, and flows between Hessen-Nassau and Rhenish Prussia, through which it afterwards pursues a north-west course. Before it reaches Cologne, it takes up numerous tributaries and affluents—viz., the Ill, Wiese, Elz, Kinzig, Murg, Neckar, Main, Lahn, Moselle, &c.; and passes the cities of Breisach, Strassburg, Germersheim, Spiers, Mannheim, Worms, Oppenheim, Mainz, Bingen, Coblenz, and Bonn. In the middle part of its course, the river makes great bends, the current is rapid, and navigation is rendered difficult by numerous small islands and sandbanks, which are subject to changes of form and position. Much has been done to improve the R. above Bingen. By an agreement made, in 1840, between France and Baden, it has been brought into its proper channel and considerably shortened. The valley through which the R. runs between steep banks from Mainz to Bonn, contains the picturesque scenery which has made this river so celebrated, and the vineyards from which the famous Rhinish wines are obtained. From Cologne to its mouth, the R. flows through a low level country, and soon after entering the Netherlands, divides it into two arms, the left, called the Waal, uniting with the Maas near Port Loewestein, and forming the Merwede or Merwe, which below Dordrecht takes the name of the Old Maas; the right arm, called the R., a little above Arnheim, throws off the New Yssel, originally a canal, cut by Drusus to connect the R. with the Old Yssel.

Flowing on to Wijk bij Duurstede, the R. divides again into the Lek, which unites with the New Maas near Ysselmonde, and the Kromme Rhine, which at Utrecht parts into the Vecht and the Old R., the latter as a small stream entering the North Sea by the Katwijk Canal to the north-west of Leyden. The delta of the R., which extends from about 51° 35' to 52° 20' N. lat., and occupies nearly 50,000 sq. m. of territory, belonging to the Dutch provinces of North and South Holland, Utrecht, and Guelderland, requires to be protected by strong embankments. The principal of these, which begin at Wesel, are about 25 or 30 feet above the lowest level of the river. Several canals connect the R. with the Rhone and Saone, the Scheldt, Meuse, and Danube, and thus open a line of communication with France and Belgium on the one side, and with the Netherlands and every part of Germany on the other. The commerce and navigation of the R., which are of vast extent and great importance, used to be regulated by treaties between the different states through which it passes, all of which levied tolls on vessels and goods entering their respective territories; and thus produced an accumulation of duties which pressed heavily on the transit trade. Steam-navigation is, however, conducted with greater regularity and energy on the R. than on any other river of Germany; and of late years, since the main lines of railway, running on either side of the river, have been connected by railway bridges across the river, additional importance and extension have been given to the commercial relations of all the countries connected with the Rhine. Pontoon or boat bridges cross the river at Cologne, Mainz, Mannheim, and a few other places.

RHINE, CONFEDERATION OF THE. See CONFEDERATION OF THE RHINE.

RHINE-WINE is a term of very general signification, applied, however, most frequently to those wines produced in the Rheingau (q. v.). The most valued and costly of these are the Schloss-Johannisberger, Hochheimer, Kloster-Erbacher, Rudesheimer, Steinberger, Gräfenberger, Rauenthaler, Rothenberger, Scharlachberger, and Markobrunner. The red Rhine-wines, of which the Asmannshäuser is the most celebrated, are not nearly so much

prized as the white; neither have they the strength or bouquet of the latter. The wines of the Lower Rhine, from Düsseldorf downwards, are generally of inferior quality.

The term Rhine-wine, in its general signification, includes the Pfalz and Moselle wines. It is now generally held in Germany that Rhine-wines that have been properly kept for three or four years are in the most wholesome condition for use; the very old stocks no longer find a ready market except in Russia and England.

RHINO'CEROS (Gr. nose-horned), a genus of Perissodactyle Ungulates, containing the largest and most powerful of terrestrial mammals, except the elephants. There are at least seven or eight existing species, all natives of the warm parts of Asia, the Indian Archipelago, and Africa; and numerous fossil species

Rhinoceros (*R. Indicus*).

have been discovered in the newest geological deposits. The form of the R. is clumsy and uncouth; its aspect dull and heavy. The limbs are thick and strong; each foot is terminated by three toes, which are covered with broad hoof-like nails. The tail is small, and terminated by a small tuft. The ears are moderately large; the eyes very small. The head is large, the muzzle prolonged, and the nasal bones combined into an arch for the support of a horn, which, however, does not spring from them, but merely from the skin; a second horn, in some of the species, growing above it, in like manner springing from the skin, and resting for support on the bone of the forehead. The upper lip is more or less prolonged and prehensile, in some of the species so much so that it is capable of being used to pick up very small objects.

The whole body, head, and limbs are covered with an extremely thick and hard skin, which in none of the existing species exhibits more than mere traces of hair, although there is evidence that some of the extinct ones were covered with fur; and the hardness of the skin being such that in some of the species it has not pliancy enough to permit the movements of the animal, it is in a manner jointed by means of folds on the neck, behind the shoulders, in front of the thighs, and on the limbs.

The horn of the R. is a very remarkable organ, and a powerful weapon of offence and defence. With it also the animal can root up bushes or small trees, the foliage or fruit of which it desires to eat. It is of a perfectly homogeneous structure (see HORNS), and solid.

The different species of R. display some differences of dentition. None of the species of R. displays a high degree of intelligence. Although usually harmless, they are easily provoked, and show much capriciousness of temper. When irritated, they become very dangerous; and although usually slow in their movements, they can, upon occasion, run rapidly. Their great weight and strength enable them to force their way through jungles, breaking down the smaller trees before them. The hide is proof against the claws of a lion or tiger, and is not to be penetrated by a leaden bullet, except at a very short distance, or in some of the thinner parts about the neck or chest. Bullets of iron or tin are used for shooting them.

The species of R. agree in being found sometimes solitary or in pairs, sometimes in little companies, never in large herds.

The **INDIAN R. (*R. Indicus*)** is a native of the continental parts of the East Indies, and lives chiefly in marshy jungles on the banks of lakes and rivers, often wallowing in the mud, with which it encases itself, apparently as a protection against insects, which annoy it notwithstanding the thickness of its hide. It is the largest known species of R., a large specimen being rather more than five feet in height. The horn is sometimes 3 feet in length, and 18 inches in circumference at the base. The Indian R. was known by very imperfect description to the ancient Greeks, receiving the very inappropriate name of *Indian Ass*; and from accounts of it the fable of the unicorn probably originated. Individuals have from time to time been brought alive to Europe, and have proved tolerably quiet and tractable, feeding with apparent satisfaction on moistened hay, vegetables, pulse, grain, &c.

—The **JAVANESE R. (*R. Javanicus*, or *R. Sondaicus*)** is a somewhat smaller species, also one-horned. Sumatra has a two-horned species (*R. Sumatrensis*).—Different species of R., all two-horned, are found in almost all parts of Africa, and one or more of them were known to the ancient Romans.—The **BOVELE** or **BLACK R. (*R. bicornis*, or *R. Africanus*)**, of South Africa, is the smallest of all the known species. It is of a black color, and its first horn is rather thick than long, its second short and conical. It is a fierce and dangerous animal, capable of great activity, and more dreaded by the South African hunter than the lion itself.—The **KEITLOA (*R. Keitloa*)** is larger, and has the two horns nearly equal in length, the foremost horn curved backwards, the other curved forwards. It is also a native of South Africa, and much dreaded both on account of its strength and its ferocity.—The **WHITE R. (*R. Simus*)**, or **MUCHUO**, or **MONOHO**, is the largest of the well-ascertained African species.

No species of R. is prolific. One young one only is produced at a birth, and the intervals are long. The flesh of the R. is used for food. That of the different species is somewhat variously esteemed. The skin is used in the East Indies for shields; in South Africa, it is sliced up into thongs.

The earliest remains of the R. are found in Miocene strata, and in the subsequent Tertiary deposits they frequently occur. Ten species have been described. A two-horned species was found by Pallas in the frozen gravel of Siberia, along with the mammoth, still covered with a shaggy coat of long wool, and having its flesh preserved.

RHINOPLASTIC OPERATION. When a portion or the whole of the nose has been destroyed by accident or disease, the deficiency may be restored by a transplantation of skin from an adjoining healthy part. When the whole nose has to be replaced, the following course is usually adopted. A triangular piece of leather is cut into the shape of the nose, and is extended on the forehead with its base uppermost; its boundaries when thus flattened, are marked out on the skin with ink. Any remains of the old nose are then pared away, and a deep groove is cut round the margins of the nasal apertures. When the bleeding from these incisions has stopped, the marked portion of the skin of the forehead must be carefully dissected away, till it hangs by a narrow strip between the eyebrows. When the bleeding from the forehead ceases, the flap must be twisted on itself, so that the surface which was originally external may remain external in the new position, and its edges must be fastened with stitches into the grooves prepared for their reception. The nose thus made, is to be supported with oiled lint, and well wrapped in flannel, to keep up the temperature. When complete adhesion has taken place, the twisted strip of skin may be cut through, or a little slip may be cut out of it, so that the surface may be uniformly smooth. When only a part of the nose, as one side only, or the septum, requires to be restored, modifications of the above operation required, and the skin, instead of being taken from the forehead, is taken from the cheek or the upper lip. For further details regarding this important operation, the reader is referred to Fergusson's *Practical Surgery*.

This operation is popularly known as the *Taliacotian Operation*, from its having been first performed by Taliacotus, who was professor of anatomy and surgery at Bologna, where he died in 1558. The work in which the operation is described was not published for more than forty years after his death. It appeared in 1597, under the title *De Custorum Chirurgia per Insitionem libri duo*. Instead of taking the skin for the new nose from the forehead, he took it from the arm of his patient, and there is no reason why the operation which he describes, although inferior in many respects to that at present adopted, should not be successful. The difficulty of keeping the arm sufficiently long in apposition with the face (a period of about twenty days), was doubtless one of the reasons for selecting the forehead in preference as the part from which to take the skin. The name of Taliacotus has been mainly popularized in this country by a well-known coarse joke in Butler's *Hudibras*. There is, however, little foundation for the view which Butler takes of the operation. Taliacotus discussed the advantages and disadvantages of taking the skin from the arm (he does not suggest any other part of the body) of another person, but he comes to the conclusion, that it would be impossible to keep two persons so fastened together for the necessary time, that no motion of the parts in apposition should occur, and he adds, that he never heard of the plan being attempted. It is almost unnecessary to add, that even if a nose were manufactured from the skin of a second person, there is not the slightest reason for apprehending that it would suddenly die and drop off on the death of the original proprietor of the skin, notwithstanding the cases to the contrary recorded, as illustrative of the power of sympathy, by Van Helmont, Campanella, Sir Kenelm Digby, and others. This astounding notion was resuscitated not many years ago by M. Edmund About in a popular novel, entitled *Le nez d'un Notaire*.

RHIPI'PTERA. see STREPSIPTERA.

RHIZA'NTHÆ (RHIZOGENS of Lindley) are a very remarkable natural order of plants. They are parasitical plants, brown, yellow, or purple, never of a green color, destitute of true leaves, and having cellular scales instead. The stem is amorphous and fungus-like; sometimes, as in *Rafflesia* (q. v.), there is no stem; but the flowers arise immediately from the surface of the branch or stem to which the plant is parasitically attached. Spiral vessels are either few or wanting, and the substance is chiefly cellular tissue. Whilst their general structure thus associates them with fungi, which they resemble also in their mode of decay, they have the flowers and sexual organs of phanerogamous plants. The flowers are monœcious, diœcious, or hermaphrodite. Lindley regards these plants as forming a class distinct from the other Phanerogamous plants (*Exogens* and *Endogens*), and as one of the connecting links between them and the Cryptogamous plants (*Thallogens* and *Acrogens*). There are not many more than 50 known species in all, of which one or two are found in the south of Europe, the others in Africa and the warmer parts of Asia and America. *Cynomorium coccineum* (*Balanophoraceæ*) is found in Malta, and is the *Fungus Melitensis* of apothecaries, long celebrated for arresting hæmorrhages. Others are likewise used as styptics. *Cytinus hypocistis* (*Cytinaceæ*) grows on the roots of species of *Cistus* in the south of Europe. Its extract (*Succus hypocistidis*) is used as an astringent in hæmorrhages and dysentery. A species of *Ombrophytum* (*Balanophoraceæ*) springs up suddenly after ruin in Peru, like a fungus, is insipid, and is cooked and eaten under the name of *Mays del Monte*. Different species of *Balanophora* are very abundant in Northern India. They are found in the Himalaya at an elevation of 10,000 feet, producing great knots on the roots of maple trees, oaks, &c., which are sought after by the Tibetans, and carried into Tibet, where they are made into very beautiful cups.

RHIZO'PODA (Gr. *rhizon*, a root, and *poda*, feet), an important class of the lowest of the animal subkingdoms, the Protozoa. In all the organisms of this class, the body is composed of a simple gelatinous substance, to which the term 'sarcode' is applied; and in all, locomotion is performed by the protrusion of processes which, from their function, are termed pseudopodia, or false feet. As in the case of all the Protozoa, except the Infusoria, there is no mouth or intestinal tube.

As a typical form of rhizopod, the *Amœba* (fig. 1), a minute ani-

Fig. 1.—*Amœba radiosa*.

a, young *Amœba*, with five pseudopodia protruded; b, another specimen.

mal readily obtained in this country, may be taken. On placing one of these organisms (obtained from a pond, or from a bottle containing some vegetable infusion) under the microscope, it is seen to resemble a roundish mass of semi-transparent jelly, altogether devoid of life. Soon, however, the animal begins to push out in various directions portions of the gelatinous mass of which it consists, and by the alternate expansion and retraction of these prolongations, it effects a slow and somewhat irregular locomotion. Should these processes come in contact with anything fit for food, they grasp it and coalesce around it, and the morsel soon

Fig. 2.—Sun-animalcule in the act of feeding.

Fig. 3.—*Diffugia proteiformis*.Fig. 4.—*Arcella acuminata*.

At a is seen a captured Infusorian entering the substance of the body.

Becomes enclosed in the interior of the body, much as (to use an illustration employed by Professor Greene in his *Manual of the Protozoa*) a stone may be forced into the interior of a lump of clay, or similar plastic material. When all that is nourishing is absorbed, the indigestible remains are ejected through some part of the body. A nucleus may generally be observed, and at times

(but not permanently) one or more clear vesicles may be noticed, containing a fluid which is apparently furnished during the process of digestion. The members of the genus *Amœba* (containing at least three species) may be regarded as representing the simplest forms of animal life. Closely allied to the *Amœba* is the *Actinophrys*, or Sun-animalcule (fig. 2), and both these genera are completely naked. In *Diffugia* (fig. 3), the 'sarcode' is invested with a membranous oval coat with an aperture at one end, from which the pseudopodia project. In *Arcella* (fig. 4) the soft parts are protected by a discoid, or hemispherical shield, open below; while in the *Foraminifera* (q. v.), the soft part is invested with a calcareous shell, which is sometimes simple, but more commonly consists of an agglomeration of minute chambers (fig. 5).

Fig. 5.—Structure of *Orbitolites complanatus* :

a, simple disc of *Orbitolites* laid open to show its interior; b, central cell; c, circumambient shell, surrounded by concentric zones of shells connected with each other by annular and radiating passages.

Various classifications of the Rhizopods have been proposed by different zoologists. That of Greene, in which they are simply divided into *Amœba* and *Foraminifera*, is sufficient for all practical purposes. All the *Amœba* are microscopic, and seldom exceed $\frac{1}{16}$ th of an inch in diameter. The *Foraminifera* (q. v.) are somewhat larger.

Amongst the most important contributions to our knowledge of this department of the animal kingdom must be mentioned: Schultze, *Ueber den Organismus der Polythalamien*, 1854; Williamson, *On the Recent Foraminifera of Great Britain*, 1858; Claparède et Lachmann, *Études sur les Infusoires et les Rhizopodes*, 1858—1860; Carpenter, *Introduction to the Study of the Foraminifera* 1861; and Hæckel *Die Radiolarien*, 1862.

RHODE ISLAND, one of the thirteen original United States of America, and the smallest in the Union, on the southern coast of New England, is 47 $\frac{1}{2}$ miles from north to south, and 37 miles from east to west; and has an area of 1806 sq. miles. It is bounded N. and E. by Massachusetts, S. by the Atlantic, and W. by Connecticut. It is divided into five counties, and its principal towns are Providence and Newport, the twin capitals; Bristol, Warren, Pawtucket, Woonsocket, &c. Narraganset Bay, which occupies the south-eastern quarter of the state, is from 3 to 12 miles wide, and filled with beautiful islands, the largest of which, Rhode Island, is 15 miles long, by 3 to 3 $\frac{1}{2}$ wide, and contains the town of Newport, a fashionable summer resort, with a large and spacious harbor, and formidable fortifications. Several small rivers, as the Pawtucket, Pawtuxet, Parocutuck, &c., rising in the hills of Massachusetts, flow into Narraganset Bay, and their frequent falls afford water-power to numerous manufacturing villages. The country is hilly and the soil rough and stony, and chiefly devoted to pasturage and orchards. The formation is chiefly of primary stratified and unstratified rocks, with some coal of a poor quality, iron, limestone, and marble. The climate is mild, and on the islands delightful. The population is chiefly engaged in trade and manufactures. There are in the state 142 cotton, 65 woollen, 26 iron factories; and a large coasting-trade and considerable fisheries are carried on. There are several railways. The state debt in 1878 was 2,434,500 dollars; the receipts for the year 1877-8 were 832,980 dollars. There are 62 national banks and 37 savings-banks, 6 daily and 19 weekly newspapers, about 300 churches, over 700 schools with 40,000 pupils, Brown University, and state penitentiary and asylums (see PROVIDENCE).

The government, which existed until 1842 under the charter given to Roger Williams in 1642, is similar to that of the other states. The governor has a salary of 1000 dollars, or about £200, and the lieutenant-governor 500 dollars, or £100 per annum. R. I. is believed to have been the Vinland of the Norsemen, who explored this coast in the 10th century. It was settled in 1636 by Roger Williams and his companions, Baptists, who were expelled for their religious opinions from the Puritan colony of Plymouth. The colony suffered from the Indian wars, until the defeat and death of Philip, king of the Wampanoags. Pop. in 1820, 83,069; 1840, 108,890; 1860, 174,621; 1870, 217,353, of whom 4980 were colored; 1880, 276,530.

RHODES, an island now belonging to Asiatic Turkey, and long an important, wealthy, and independent state of ancient Greece, in the Mediterranean, lies off the south-west coast of Anatolia, from the nearest point of which it is distant about 12 miles. It is 45 miles long, and 20 miles in greatest breadth, and is traversed in the direction of its length—from north-east to south-west—by a chain of mountains, which reach in Mount Artemira (the former *Atabyros*) a height of 4070 feet, and in Mount Artamiti of near 6000 feet. Pop. about 30,000, of whom 6000 are Turks, 1000 are Jews, and the remainder Greeks. The mountains are covered with forests, the valleys are fertile, and the well-watered plains form rich and beautiful pasture-lands. Of all the islands in the Levant, R. possesses the most beautiful and the most temperate climate. It produces oil, oranges, citrons, &c., and might raise in profusion most necessities and luxuries. But owing to the insecurity and extortion from which the Rhodians have long suffered, agriculture is in a very depressed state; much fertile lands lies waste, and the island does not even raise corn enough for its scanty population. A little marble is quarried. The harbors are neglected, and the trade is now inconsiderable.

R., the ancient *Rhodos*, was inhabited at a very early period. The Telchines, who are asserted by tradition to have been its most ancient inhabitants, are said to have migrated hither from Crete. It was not, however, until the immigration of a branch of the Doric race that the distinctive national character of the Rhodians became fixed. The first immigration of Dorians seems to have taken place before the Trojan war, for R. is said to have sent nine ships to Troy under the leadership of the Heracleid Tlepolemus. Situated between the three ancient continents, a position highly favorable to the development of commercial enterprise, the Rhodians at an early period rose to great prosperity and affluence. Their three most ancient towns were Lindus, Ialysus, and Camirus, and they planted numerous colonies not only on the shores in their vicinity, but also on the coasts of Lycia, Italy, Sicily, and Spain. At the end of the 5th c. B.C., they founded the city of Rhodes (q. v.); and after this event, the history of the island is comprised in that of the city.

RHODES, an ancient and famous maritime city, capital of the island of the same name, and situated on the north-east extremity of that island. Lat. of harbor 36° 26' N., long. 28° 16' E. The modern city, though scarcely one-fourth the size of the former one, has an imposing appearance. Its site is admirable, and it rises in the form of an amphitheater behind the fortified harbors, of which there are two, separated from each other by a narrow quay. At the entrance to the harbors stand the two large quadrangular towers of St. John and St. Michael. The harbors, however, are now neglected, and this once flourishing mart of the East is now comparatively desolate, and is no longer the seat of industry or active commerce. The town, overlooked by mosques and minarets, consists of ill-built houses and gloomy streets. The earthquakes of 1851, of 1856, and of 1863, as well as the frightful powder-explosion in 1856, caused by a flash of lightning, did much to devastate the town. By the powder-explosion, the church of St. John, built in 1500, and the great tower of the Knights of St. John, were shattered, together with 300 houses, under the ruins of which 1000 townspeople lost their lives; and by the earthquake of 1863, 2000 houses were destroyed, and many lives lost. The palace of the Grand Master is now in ruins, and the hospital of the knights now serves as a granary. Pop. about 20,000.

The city of R. was founded in 403 B.C., and was built on a regular plan, the unity and harmony of its architecture being secured by the circumstance, that the design of the whole was the work of one man. It was girt about by strong walls, surmounted by towers, and was provided with two excellent harbors. But it was remarkable for the number and excellence of its paintings, sculptures, and statues, as well as for the beauty and strength of its architecture. At the entrance of one of its ports stood a gigantic brazen statue of Helios, 70 cubits in height, and called the Colossus of Rhodes. Besides this statue, which is described as one of the seven wonders of the ancient world, 3000 others, of which 100 were colossal, adorned the city. The capital of a fertile and flourishing island, and the great center of the commerce of the Mediterranean, R. long enjoyed great prosperity. The arts were also prosecuted with assiduity, and intellectual activity manifested itself here long after it had declined in most parts of Greece. From the outbreak of the Peloponnesian War to the middle of the 4th c. B.C., R. was alternately in league with Athens and in arms against that city. Like the rest of Greece, it submitted to the victorious Alexander, and received a Macedonian garrison; but on the death of Alexander, 323 B.C. the Rhodians rose upon and expelled the intruders. From this time to the overthrow of the Macedonian monarchy, R. largely extended its territories, and rose to great commercial and naval importance. After the death of Cæsar, whose side the Rhodians had taken against Pompey in

the civil war, they were defeated in a naval engagement by Cæsar, who in 42 B.C. entered the city by force, massacred the hostile leaders, seized the public property, and rifled the temples. This visitation broke the power of R., but it long continued to maintain its *prestige* as a seat of learning. During several centuries, R. remained in the power of the Greek emperors. In 1310, the Grand Master of the Knights of St. John of Jerusalem settled here, and here the brethren remained till the 16th century. (See JOHN, ST., KNIGHTS OF.) Since this period, R. has remained a possession of Turkey.

RHO'DIAN LAW is the earliest system of marine law known to history, said to be compiled by the Rhodians after they had by their commerce and naval victories obtained the sovereignty of the sea, about 900 years before the Christian era. Cicero refers to the Rhodians as illustrious for their naval discipline. The collection of Marine institutions termed Rhodian Laws is to be found in Vinnius, but their authenticity is doubted. Some say that the Romans adopted these laws during the first Punic war; others say that Justinian incorporated them with the Roman law. The leading points supposed to be borrowed from the Rhodian law relate to the shares of the officers and crew of a ship, the punishment of barratry and of plundering wrecks, and compensation payable to the heirs of mariners who lost their lives in the service of the vessel.

RHO'DIUM (symb. R., Rh, and Ro, according to different chemists; eq. 52—new system, 104—sp. gr. 12.1) is one of the metals of the platinum group. It is a white, very hard metal, resembling aluminium rather than silver. It fuses less easily than platinum. It is ductile and malleable when pure and after fusion, and insoluble in all acids; but when alloyed in small quantity with platinum, copper, bismuth, or lead, it dissolves with them in *aqua regia*. It usually forms about one-half per cent. of the ore of platinum, from which it is extracted by a complicated process, for details of which we must refer to Deville and Debray's 'Memoir on Platinum and its Ores,' in the *Annales de Chimie et de Physique* for 1859. Two oxides, two sulphides, and three chlorides of rhodium have been obtained and examined by chemists. The sesquichloride unites with several soluble chlorides to form crystallizable double salts, which are of a rose color (whence the name rhodium, from the Gr. *rhodon*, a rose). An alloy of steel, with a small quantity of rhodium, is said to possess extremely valuable properties; and according to Deville, an alloy of 80 or more parts of rhodium with 70 of platinum, is easily worked, and is not attacked by aqua regia, and hence it forms an excellent material for crucibles. This metal was discovered in 1803 by Wollaston.

RHODODE'NDRON (Gr. rose-tree), a genus of trees and shrubs of the natural order *Ericææ*, having ten stamens, a very small calyx, a bell-shaped or somewhat funnel-shaped corolla, and a capsule splitting up through the dissepiments. The buds in this and nearly allied genera, as *Azalea* (q. v.), are scaly and conical. The species are numerous; they have evergreen leaves, and many of them are of great beauty both in foliage and in flowers. A few small species are natives of Continental Europe and of Siberia; but the greater number belong to the temperate parts of North America, and to the mountains of India. *R. maximum*, so designated when the far larger India species were unknown, is common in Britain as an ornamental shrub. It is a large shrub or small tree, which forms impenetrable thickets on many parts of the Alleghany Mountains, and has a magnificent appearance when in flower. The leaves are large, oblong, acute, stalked, leathery, dark green, and shining above, rusty brown beneath. The flowers are large, in umbellate corymbs, varying in color from pale carmine to lilac. This species is quite hardy in Britain; as is also *R. ponticum*, a very similar species, with narrower and more pointed leaves, which are of the same color on both sides, a native of Western Asia, and apparently also of the south of Spain. *R. Catawbiense*, a native of the southern parts of the Alleghany, with large purple flowers; *R. Caucasicum*, the name of which indicates its origin; and *R. arboreum*, a native of Nepal, with very dense heads of large scarlet flowers, and leaves 4–6 inches long, attaining in its native country a height of 80 or 40 feet, are also fine species, and well known. Most of the extremely numerous varieties now common in our gardens and shrubberies have been produced from them by hybridizing or otherwise.—Many splendid species of R. have recently been discovered in the Himalaya, the Khasia Hills, and other mountainous parts of India, by Dr. Hooker and others; and some of them have begun to be introduced into cultivation in Europe. It is impossible for us to notice more than a few.

R. Falconeri is described as in foliage the most superb of all, the leaves being 18 or 19 inches long. It is a tree 30–50 feet high, with leaves only at the extremities of the branches. It grows in Eastern Nepal at an altitude of 10,000 feet. *R. argenteum* has flowers 4½ inches long, and equally broad, clustered, and very beautiful. *R. Maddeni*, *R. Aucklandii*, *R. Edgeworthii*,

and others, have white flowers. *R. Dalhousiae* is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from three to six white lemon-scented bells, 4½ inches long, at the end of each branch. *R. Nuttallii* has fragrant white flowers, said to be larger than those of any other rhododendron. All these belong to the Himalaya. In more southern latitudes, as on the Neigherry Hills and on the mountains of Ceylon, *R. nobile* prevails, a timber tree 50–70 feet high, every branch covered with a blaze of crimson flowers.—*R. Keyssii*, and *R. Thibaudiense*, also natives of the north of India, have flowers with nearly tubular corolla.—*R. ferrugineum*, and *R. hirsutum* are small species, shrubs from one to three feet in height, natives of the Alps, and among the finest ornaments of alpine scenery. They are called *Alpenrose* (Alpine Rose) by the Germans. They are not easily cultivated in gardens. They have small carmine-colored flowers in umbellate clusters. The mountain slopes glow with their blossoms in July and August. The flora of the Himalaya contains a number of similar small species. *R. anthopogon* and *R. setosum*, dwarf shrubs with strongly-scented leaves, clothe the mountains in Eastern Nepal at an elevation of 12,000 feet and upwards, with a green mantle, brilliant with flowers in summer. *R. nivale* is the most alpine of woody plants, spreading its small woody branches close to the ground, at an elevation of 17,000 feet in Sikkin. *R. Lapponicum*, a procumbent shrub, with small flowers, grows as far north as human settlements have reached in Europe, Asia, and America.—Some of the species of this genus possess narcotic properties. An oil obtained from the buds of *R. ferrugineum* and *R. hirsutum* is used by the inhabitants of the Alps, under the name *Udo di Marmotta*, as a remedy for pains in the joints, gout, and stone. *R. chrysanthum*, a low shrub, with golden yellow flowers, native of Siberia, is also used in gout and rheumatism. *R. cinnabarinum*, a Himalayan species, poisons goats which feed upon it, and when used for fuel, causes inflammation of the face and eyes. But the flowers of *R. arboreum* are eaten in India, and Europeans make a pleasant jelly of them.

RHO'MBUS. See PARALLELOGRAM.

RHONE (*Rhodanus* of the Romans), which takes its rise in the Swiss Alps (on the western side of Mount St. Gothard, not far from the sources of the Rhine, is the only important French river which falls into the Mediterranean. Its entire length, from its origin to the Gulf of Lyon at its embouchure, is 644 miles, and the area of its river-basin 28,000 sq. miles. The R. is, for its length, probably the most rapid river in the world. On issuing from its source, it runs in a south-westerly direction through the canton of Valais, and after being swelled in its rapid course by the afflux of several tributaries, it takes a sudden turn to the north near Martigny, and throws its waters into the Lake of Geneva (q. v.). After issuing from the lake, it takes up the turbid stream of the Arve, and forcing its passage through a rocky gorge of the Jura chain, disappears below the rocks near Fort l'Ecluse for a length of 300 feet, forming the subterranean channel known as *La Perte du Rhone*. At St. Gênis, the R. enters a less mountainous district, and passing beyond the Jura district, flows through a low valley to Lyon, where it receives the Saône. From Lyon it follows a southern direction past Vienne, Valence, Montélimar, Avignon, and Arles, bifurcating near Beaucaire and Tariscon into two main streams, the Greater and the Lesser Rhone, which enclose the delta known as the Ile de la Camargue, and finally merge their waters with those of the Mediterranean. The most important affluents of the R. are, on the right, the Ain, Saône, Doubs, Ardèche, and Gard; on the left, the Arve, Isère, Drôme, and Durance. From Lyon southward, the R. is easily navigable for good-sized vessels; but the up-navigation, owing to the rapid fall of the stream, and the sudden shifting of sandbanks, is attended with considerable difficulty, and is at times almost impracticable. On account of these and other obstructions, which are greatest near the mouths of the river, the communication with the Mediterranean is chiefly effected by means of canals, which, communicating with several shore-lakes, as l'Etang de Berre and others, open a passage between the sea at Port du Bouc and the river at Arles, and thus obviate the necessity of navigating round the delta.

In its upper and middle course, the R. presents beautiful and varied scenery, enriched with a luxuriant southern vegetation, including grapes of superior quality, from which some of the finest wines of France are obtained; but below Avignon, it passes through a broad, arid tract of country, and is bounded by swampy banks. The great national commercial advantages of the R. have been considerably extended by means of numerous canals, which, by joining it to the Seine, the Loire, and the Rhine, have connected it with the Atlantic and the German Ocean.

RHONE, a small but important inland department of France, founded on the N., W., and S. by the departments of Saône-et-Loire and Loire; area, 1077 sq. m.; pop. (1881) 733,562. It lies almost wholly in the basin of the Rhone, and its great affluent the

Saône; its eastern boundary is formed by these rivers. The surface is almost entirely mountainous or hilly. Of the 689,536 acres, more than one-half is under tillage. The principal productions are vines and mulberry-trees. The wines are famous for their excellent quality. Of the Mâcon wines, grown in the north, in the former district of Beaujolais, the best are the fine red wines of Chénas; of those grown in the south of the department, called the *vins du Rhone*, the finest are the red wines of Côte Rôtie and the white wines of Condrieu. About 75,000 acres are in vineyards, and the amount of wine made annually is about 17,000,000 gallons. Silks (see LYON) are manufactured extensively, and numerous other branches of manufacture are actively carried on. The industries of the department are mentioned under the names of the towns. The department is divided into the two arrondissements of Lyon and Villefranche. Capital, Lyon (q. v.).

RHONE, BOUCHES DU. See BOUCHES-DU-RHONE.

RHUBARB (*Rheum*), a genus of plants of the natural order *Polygonaceæ*, closely allied to *Rumex* (dock and sorrel), from which it differs in having nine stamens, three shield-like stigmas, and a three-winged acheneum. The species, which are numerous, are large herbaceous plants, natives of the central regions of Asia, with strong, branching, almost fleshy roots; erect, thick, branching stems, sometimes 6 or 8 feet high; the stems and branches whilst in the bud covered with large membranous sheaths. The leaves are large, stalked, entire or lobed; the flowers are small, whitish or red, generally very numerous, in large loose panicles of many-flowered clusters. The roots are medicinal; but those of different species seem to possess the medicinal properties in very different degrees, or these properties are developed very variously in different soils and climates, or according to other circumstances not at all understood. It is not known what species of R. yields the valued R. of commerce, which comes from inland parts of China or Chinese Tartary. Some of it reaches Europe by way of Canton, but the best is brought through Russia. It is commonly known, however, in Britain as *Turkey R.*, because it was formerly brought by way of Natolia. It is carefully examined at Kiachta by persons appointed by the Russian government, so that the superior quality of all that is permitted to enter the European market is secured. R. is sometimes cultivated for its root in Europe, but the produce, *French R.* and *English R.*, is very inferior to the R. of the East, which it is often employed to adulterate. About 12 acres are devoted to the cultivation of R. for its root near Banbury, in England, the species cultivated being *Rheum raphaniticum*; but in France, besides this species, *R. undulatum* and *R. compactum* are employed. At Banbury, the roots are taken up when three or four years old, and dried in drying-houses by a carefully regulated heat.

The leaf-stalks of R. contain an agreeable mixture of citric and malic acids, and when young and tender, are much used, like apples, for tarts or pies, and also for making a kind of preserve. For these purposes, different kinds of R. are now very extensively cultivated in Britain, and in other temperate and cold countries, although it is only since the beginning of the present century that this valuable addition has been made to the plants of our kitchen-gardens; the species previously introduced having been cultivated merely as objects of curiosity, or for the sake of their roots. A number of species have been introduced into cultivation for their leaf-stalks. *R. palmatum*, the first species known, and which was once believed to yield the *Turkey R.* has roundish green leaf-stalks and half-palmate leaves, with pinnatifid pointed lobes. Its stalks are very inferior to every other kind in our gardens both in size and quality, and the appearance of the leaf is very different. The other cultivated kinds, *R. undulatum*, *R. raphaniticum*, and *R. hybridum*, with endless varieties produced by the art of the gardener, all have broad, heart-shaped, undivided leaves, and the leaf-stalks flattened and grooved on the upper side. The leaf-stalks are often also of a reddish color, which in some of the finest varieties pervades their whole flesh. R. is propagated by seed, and the plants yield a crop in the second or third year, or by dividing the roots. It prefers a light rich soil; and the ground ought to be heavily manured every year. The plants are placed 3 or 4 feet apart, according to the size of the variety. The varieties which, by excessive manuring, are made to produce the most gigantic stalks, are not nearly so good in quality as the smaller kinds. R. is cultivated on a most extensive scale by market-gardeners. It is forced in winter and early spring by being placed in pots within houses, or by having pots inverted over it, and dung and straw heaped around; and forced R. is more tender and delicate than that which grows in open air.

There are few subjects in the materia medica which are so enveloped in obscurity as rhubarb. Even the period of its introduction into medicine is uncertain, for the description given by Dioscorides of the drug which he designates *Rheum* does not correspond with our rhubarb. It was probably introduced into Europe by the Arabian physicians, somewhat previous to the time of Avicenna, in whose writings the term *Rerund* occurs—a name

still used, with a slight alteration, for *R.* by the Persians and Hindus. In the British Pharmacopœia, no attempt is made to determine the species of *Rheum* used in medicine, and there can be no doubt that the roots of several species are usually to be found in the drug-market. According to the Pharmacopœia, the root, deprived of its bark, is imported from 'Chinese, Tibet and Tartary.' Little is known of the chemical composition of *R.* root, further than that it yields a yellow coloring matter termed *Rhein* ($C_{20}H_{30}O_8$?), which is sparingly soluble in water, but dissolves freely in the alkalis, producing a reddish-brown liquid, from which the *rhein* may be precipitated in flakes on the addition of acetic acid. *R.* is very liable to adulteration; and if the adulterated *R.* be in a state of powder, the detection of the fraud is very difficult.

R. may be briefly described as a cathartic, an astringent, and a tonic. As a cathartic, it chiefly operates by increasing the muscular action of the intestines; and when the cathartic action is over, there is generally more or less constipation, arising, as is usually supposed, from the astringent action then coming into play. The appetite is also improved, and the digestive process rendered more active, by the action of this drug. It must not be forgotten that the coloring matter of *R.* passes into the serum of the blood and the secretions; and urine rendered red by its absorption has not unfrequently been confounded with bloody urine by practitioners ignorant of the very different chemical reactions of *rhein* and the coloring matter of blood.

R. is one of the best aperients for general use in infancy, in consequence of the certainty of its action, and of its tonic and astringent properties, which are of much importance in the treatment of many infantile diseases, attended with imperfect digestion and irritation of the intestinal canal. In adults, it is serviceable in chronic diarrhœa and dysentery, when it is expedient to clean out the bowels. It is also a useful aperient in convalescence from exhausting disease, as being free from the risk of overacting; and for the same reason, it is a useful medicine for persons who are constitutionally liable to over-purgation from trivial causes.

The official preparations are the *Pulsis Rhei Compositus* (composed of powdered *R.*, magnesia, and ginger, and popularly known as Gregory's Powder or Mixture—the average dose being a teaspoonful), the *Pilula Rhei Composita* (a compound *R.* pill, composed of *R.*, aloes, myrrh, hard soap, oil of peppermint, and treacle—the dose, as an aperient, being ten or fifteen grains), the *Extractum Rhei* (dose from five to ten grains), the *Infusum Rhei* (dose from two to four fluid ounces), and the *Tinctura Rhei*, which is usually given in doses of about a drachm, in association with other aperients.

RHUMB, or RHOMB (Lat. *rhombus*), a term introduced, according to Vitalis, into navigation by the Portuguese, and signifying at first a meridian, or especially the principal meridian of a map. It then came to signify any vertical circle, whether a meridian or not, and hence any point of the compass. A ship is therefore said to sail on a rhumb when its head is kept constantly directed to the same point of the compass. The rhumb-line thus crosses all meridians at the same angle, and corresponds exactly to what is known as the *Loxodromic Lines* (q. v.). In Mercator's chart the rhumb-line is a straight line (though not so in nature); but it must be carefully noticed that equal portions of it on the chart do not indicate equal distances on the surface of the globe, the divisions which are lowest in latitude always representing the greatest distance, and vice versa.

RHYME. See **RHIME**.

RHYMER, THOMAS THE. a name given to the earliest poet of Scotland. The history of his life and writings is involved in much obscurity; but it is generally believed that Thomas Rymour of Erildoune was the person whose poems and prophecies were extensively known among the people of Scotland at an early period. The *R.* derived his territorial appellation from the village of Erildoune (now Earlston), in the county of Berwick. The time of his birth is unknown; but he appears to have reached the height of his reputation in 1286, when he is said to have predicted the death of Alexander III., king of Scotland. This singular prophecy is recorded in the *Scotichronicon* of Fordun in 1430; also by the historian Boece in 1527. It is to the effect that the Earl of Dunbar, having on one occasion questioned the *R.* as to what kind of weather was to be on the morrow, was answered that on that day before noon should be the greatest storm of wind that ever was heard in Scotland. Next day, towards noon, the weather being calm, Dunbar expressed a doubt as to the truth of the prediction, when the *R.* said: 'It is not noon yet;' and immediately thereafter a messenger arriving with the tidings of the king's accidental death at Kinghorn on the previous evening, the prophet stated that that was the storm he had predicted.

From this and other prophecies, the *R.* became popularly known as 'True Thomas,' and was believed to have derived his skill from his intercourse with the Queen of Fairyland. The legend bears that he was carried off at an early age to Fairyland, and after

seven years' residence there, was permitted to revisit the earth, but still remaining bound to return to his royal mistress when she should intimate her pleasure. Accordingly, one day, when a hart and hind were seen comely and slowly parading the street of the village, the *R.* instantly rose and followed the animals to the forest, whence he was never seen to return. (Compare the myth of TANNHAUSER.)

The earliest historical document referring to Thomas Rymour of Erildoune, is a charter of Petrus de Haga of Bemersyde, to which the *R.*'s name is appended as a witness; its date is about 1260-70. Again, in a charter of 1294, Thomas of Erildoune, describing himself as 'son and heir of Thomas Rymour of Erildoune,' conveys his lands in the village of Erildoune to the Trinity House of Soltra. From this it has been inferred that the *R.* was now dead; although Blind Harry, in his *Wallace*, speaks of him as still alive in 1296. The *R.* is also alluded to by Winton in his *Chronicle*. Boece calls him Thomas Learmont, and in this has been followed by others; but there is no contemporary authority for this surname. Whether Rymour was a family surname, or a personal appellation derived from his poetical reputation, has also been discussed. The fact that his son, in the charter above referred to, applies the name to his father, but does not take it himself, seems to favor the latter view.

The *R.* is chiefly famous for the prophecies which have been attributed to him, and which were first collected and published in Edinburgh by Waldegrave, in 1603. Sir Walter Scott believed him to be the author of the famous romance of *Sir Tristram*, because his name occurs along with that of the romance in an ambiguous passage in the poems of Robert of Brunne (1303). But the romance is now believed to have had a French origin, and to be of earlier date than the time of the *R.* The other poems attributed to him are chiefly descriptive of his interviews with the Fairy Queen, and his adventures in Fairyland. They display poetical power of a very high order. These have been edited by Dr. J. A. H. Murray for the Early English Text Society (1876).

RHYNCHONELLA, a genus of brachiopodous mollusca, characterized by its trigonal acutely-beaked shell, the dorsal valve of which is elevated in front, and depressed at the sides, and the ventral valve is flattened or hollowed along the center. The genus is represented by two living species, the one from the key seas of the north, and the other from New Zealand. The shells of both are black. No less than 250 species of fossil shells have been referred to the genus. They occur in all formations from the Lower Silurian upwards.

RHYNCHOPHORA. See **WEEVIL**.

RHYNCHOPS, commonly called **SKIMMER**, is a genus of web-footed birds of the *Laridae* (q. v.) family, to which the gulls, &c. belong. The bill is broad at the base, but thence to the tip is laterally compressed. The upper mandible is the shorter. There are three or four species; the best known being the black Skimmer, found on the east coasts of North and South America. In all, the flight is swift and graceful; they rarely swim; and they feed, chiefly by night, on fish and crustaceans.

RHYTHM (Gr. *rhythmos*, any motion, especially a regulated, recurring motion; hence, measured motion, time, number), in its widest sense, may be defined as measured or timed movement, regulated succession. It seems to be a necessity for man, if movements of any kind are to be sustained for a length of time, that some more or less strict law of interchange should regulate the succession of the parts. It is even believed that the ground of this necessity may be discovered in the structure and functions of the human body. See Bain, *The Senses and the Intellect*. More particularly, in order that a number of parts may constitute a whole, or, at all events, a pleasing whole, a certain relation or proportion must be felt to pervade them. When exemplified in the arrangement of matter into visible objects, as in sculpture, architecture, and other plastic arts, rhythm is usually called *symmetry*. Rhythm applied to the movements of the body produces the *dance*. 'The rhythmical arrangement of sounds not articulated produces *music*, while from the like arrangement of articulate sounds, we get the cadences of *prose*, and the measures of *verse*. Verse may be defined as a succession of articulate sounds, regulated by a rhythm so definite that we can readily foresee the results which follow from its application. Rhythm is also met with in prose; but in the latter its range is so wide that we never can anticipate its flow, while the pleasure we derive from verse is founded on this very anticipation.'

The rhythm of verse is marked in various ways. In Sanscrit, Greek, and Latin, during their classic periods, *quantity*, or the regulated succession of long and short syllables, was the distinguishing mark of verse. In the languages descended from these three ancient tongues, as well as in all the other Aryan languages, the rhythm depends upon *accent*. See **METRE**. The recurrence of similar sounds, or *rhime*, is also used, along with accent, to render certain points of the rhythm more distinct, as well as to embellish it. See **RHIME**.

RHYTHM, in Music, the disposition of the notes of a musical composition in respect of time and measure. To rhythm, music is chiefly indebted for its order, perspicuity, intelligibility, and consequently its power and effect. The rhythmic value of a musical sound is the ratio which its duration bears to that of other sounds. See **NOTE**. A musical composition is made up of portions of equal rhythmic value, called *measures*, separated by vertical lines called bars, the length of the measure being indicated by a sign at the beginning of the movement. For the varieties of time and their signatures, see **MUSIC**. The first note in each measure is distinguished by a greater force or stress than the rest: that stress is called *accent*, and of the four measure-notes in common time the third has also a subordinate accent, as has the third measure-note in triple-time. There is also an irregular or rhetorical accent in music called *emphasis*, which may be laid on any part of the measure, and whose use is regulated by taste and feeling.

RHYTHMICAL MENTAL DISEASES. Certain affections become aggravated or mitigated at particular hours; certain others appear in paroxysms, to a certain extent of regular duration and recurrence; and a third class is named quotidian, quartan, &c., from the precise and unvarying periods at which their access returns. The element of time, and of regular intervals of time, is chiefly characteristic of morbid conditions of the nervous system. In chorea and involuntary shrieking, singing, &c., a rhythm may often be detected, of which the patient is altogether unconscious. Not merely have movements of the eyelids and of the limbs presented a perfectly timed succession, but cases are recorded where the wild gesticulations and jactations of St. Vitus's Dance have been regulated so as to correspond to popular airs. A person has been known to strike his breast with the hand for hours with the same exactitude as if measured by a time-piece. Those affected with Tarantism are prompted to dance by the sound of music; and their movements are determined, it is affirmed, not by volition, but by the cadences of the tunes played in their hearing. The victims of the dancing mania in the 15th c. were similarly affected. In many forms of insanity, there is seen a tendency to rhyming in words, as well as to rhythmical movements. A patient for three consecutive days vociferated incessantly words terminating in *-ation*.—Laycock, *Nervous Diseases of Women*, pp. 185, 314; Sauvage, *Nosologia Methodica*, tomus ii., p. 231; *Medical Critica*, *passim*.

RIAZAN, a central government of Great Russia, extends S.-E. from the government of Moscow. Area, 16,221 sq. m.; pop. (1879) 1,653,263. The principal river is the Oka, which, after forming the boundary between the governments of Moscow and Tula, and part of the boundary between Moscow and R., flows south-east to the middle of the latter, then turning north, disappears across the border on the north-east. The Oka divides the government into two unequal parts, of which the northern is low in surface and sandy in soil, while the southern presents an elevated surface and a most fertile soil. The Don crosses the south-west part of R., but is not here navigable. The chief products are iron ores, limestone, wheat, oats, rye, millet, buckwheat, and vegetables. There are many remarkably good studs. Though the chief occupations are agriculture and horticulture, there are a number of important industrial establishments, as needle, cloth, and glass factories; cotton-mills, iron-works, tanneries, and soap and tallow works. Manufactured goods and corn are exported.

RIAZAN, a town of Great Russia, capital of the government of the same name, stands on a branch of the Oka, near its junction with that river, 180 miles south-east of Moscow. It was founded in 1208, became in 1487 the residence of the princes of Riazan, and was made chief town of the government of R. in 1778. The chief fragment of antiquity is the interesting old fort called the Kremlin. There is a ferry here across the Oka, at which the products of the vicinity are shipped: 5,770,000 bushels of corn are exported annually. Pop. (1880) 19,990.

RIB, in Architecture, a projecting band or moulding on an arched or flat ceiling. It is of universal use in all styles of Gothic architecture; the early Norman examples are simple square bands crossing the vault at right angles, the groins being plain angles. In early English, the groins and ridge are also ribbed, and all the ribs are moulded. The ribs and their mouldings are multiplied as the style advances, till the whole surface becomes covered with them in the Fan-tracery Vaults (q. v.). Plaster ceilings are sometimes elaborately ornamented with patterns formed by ribs, especially in the styles of the times of Elizabeth and James I.

RIBBON, in Heraldry, a diminutive of the ordinary called the Bend, of which it is one-eighth in width.

RIBBON. See **SILK** and **SILKWORM**.

RIBBON-FISH, the popular name of a family of acanthopterous fishes, called *Tenidae*, or, more properly, *Tenionidae*, by nat-

uralists (from *tania*, a tape-worm), on account of their compressed and elongated form. Notwithstanding their peculiarity of form, they are nearly allied to the *Scomberidae*, or Mackerel family. They are of very delicate structure, with naked and silvery skin, a long dorsal fin often uniting with the tail-fin, a small mouth, and a protractile snout. They are widely distributed from polar to tropical seas, but are nowhere found in abundance, being deep-sea fishes, and mere occasional visitants of the coasts. Owing to the delicacy of their frame, perfect specimens are seldom obtained. Species exist which are nine or ten feet long, not six inches deep, and scarcely an inch thick. See **BAND-FISH**, **DEAL-FISH**, and **GYMNETRUS**.

RIBBONISM, the name of a system of secret associations among the lower classes in Ireland, the objects of which have long been a subject of much suspicion and of considerable controversy. The first origin of the associations known under this name is involved in much obscurity. From the middle of the last century secret organizations, variously designated, but for the most part connected with agrarian discontent, have from time to time arisen in Ireland. The earliest of these appears to have been that of the Whiteboys, who appeared about the year 1759. Later in the century, the fierce and sanguinary strife to which the relaxation of some of the penal laws under which the Catholics had long suffered gave occasion in the north, and which resulted in the Protestant organization already described under the head **ORANGEMAN** (q. v.), led to the Catholic counter-organization known by the name of Defenders; but this association seems to have been for the time purely local, being confined to Armagh and the neighboring counties, in which the violence of the Protestant party had originated. The severely repressive measures adopted by the government on the outbreak of the rebellion of 1698, and continued for several years, prevented any notable progress of the Catholic organization; and when at length, about 1806, such an organization was initiated, it was of necessity conducted with the utmost secrecy. The name by which the members of these associations were now known was 'Threshers.' They appeared chiefly in Sligo, Mayo, Leitrim, Longford, and Cavan; and it is worthy of note that one of their professed objects was to resist the payment of tithes, and even of the stipend commonly, although freely, paid to the Catholic priests by members of their congregations.

The associations called (it is supposed from the badge worn by the members) by the name of Ribbon societies first appeared about 1808, and originated in Armagh, whence they spread to Down, Antrim, Tyrone, and Fermanagh. There can be no doubt that their real object was a combined action, partly for self-defence, partly also probably for directly antagonistic action against the now wide-spread and formidable Orange confederacy. Their operations from the first were for the most part limited to the counties, chiefly in the north and north-west, in which the Orange associations were sufficiently numerous to be formidable; nor do they appear at any time to have had a footing in the purely Catholic counties, where there were few or no Orangemen to be encountered. The secret associations of the other districts—the midland, southern, and south-eastern counties—as the 'Carders' in East and West Meath, in Roscommon, and part of Mayo; and the 'Shanavests' and 'Caravats' in Tipperary, Kilkenny, Cork, and Limerick, had little of the religious element in their organization, being mainly due to discontents arising from alleged agrarian and social grievances.

The Ribbon association also, no doubt, addressed itself to the same agrarian and social grievances; but it is plain that its direct and immediate object was antagonism to the Orange confederation, to which, in some respects, it bore considerable resemblance, although it was deficient in that complete and wide-spread organization which so remarkably distinguished the former body. The Ribbon association was divided, like the Orange, into lodges, and the members of each lodge were bound by a secret oath to 'be true to each other,' and 'to assist each other in all things lawful.'

Stated meetings of the lodges were held, and small money contributions were exacted, both at entrance into the association, and on each occasion of meeting. The members, moreover, were known to each other by certain secret signs and pass-words, which were frequently changed, and some of the specimens of which were of a singularly absurd and ludicrous character. But there does not appear to have been anything like that complete and curious scheme of a 'Central Grand Lodge,' with its subordinate hierarchy of 'county,' 'district,' and 'private' lodges, which characterized the great rival confederation. A still more striking and important difference was in the class of men with which the Ribbon societies were recruited. They are proved to have consisted exclusively of the very lowest classes, the humble peasantry, farm-servants, and operatives of the least intelligent class. No trace appears among them of what is so striking in the Orange Association—the co-operation, or even the countenance,

of the gentry, the clergy, the commercial class, hardly even of the farming class, except a few of the sons of farmers of the lowest grade. On the contrary, an attempt which was made, in a committee of the House of Lords in 1889, to connect the Catholic clergy and the Catholics generally with the Ribbon association, proved a signal failure, as did also the attempt to show that the objects of the association were the overthrow of British rule in Ireland; and it was proved that the Catholic clergy, from the first origin of these associations, have persistently opposed them, and employed all their influence, and even their spiritual authority, to deter their flocks from taking any part in them.

From the absence of all statistical information, and from the rude and illiterate material out of which alone these societies are formed, it is impossible to offer any estimate of their number or extent. That they still exist, becomes abundantly clear on every occasion of party-strife which arises in Ireland; but they appear to have been replaced in several parts of the country by newer associations, such as the 'Phenicians,' the 'Brotherhood of St. Patrick,' and the 'Fenians,' an association which is said to possess large affiliations in America, and among the Irish in the manufacturing towns of England and Scotland. See FENIANS.

RIBEAUVILLE (Ger. *Rapportsweller*), a small manufacturing town of Alsace, pleasantly situated amid vineyards, 34 miles south-south-west of Strasburg. Excellent wines are made, and cotton goods are manufactured. The town is overlooked by the Vosges Mountains, along the crests of which runs a wall or rampart, built of unhewn stones, without cement, and from eight to ten feet high. It is of unknown antiquity, and is called the *Heidenmauer*, or Pagan wall. Pop. (1875) 5785.

RIBERA, JOSE, called **SPAGNOLETTO** ('the Little Spaniard') was born at Xativa, near Valencia, in 1588, and died at Naples in 1656 or 1659. He studied a few years with Francesco Ribalta, a Spanish painter of eminence, but resolved to visit Italy; and after working hard at Rome, and studying the greatest masterpieces in some other states, he went to Naples, where, attracted by the novelty and boldness of Caravaggio's style, he adopted it, and became the ablest painter among the *naturalisti*, or artists whose treatment of subjects was based on a vigorous and powerful, but generally coarse and vulgar representation of nature, in opposition to that formed on the study of conventional or academic rules. He settled in Naples, where he became court-painter, and executed numerous important commissions in that city; and it is there that his best works are to be seen. Salvator Rosa and Guercino are numbered among his pupils. He executed about eighteen or twenty etchings, all marked by force and freedom.

RIB-GRASS. See **PLANTAGINEÆ**.

RIBS are elastic arches of bone, which, with the vertebral

these, from being quite free at their anterior extremities, are termed *floating ribs*. A glance at a skeleton, or at a plate representing the articulated bones, will show that the ribs vary very

Fig. 2.—A Front View of the Articulations of the Ribs with the Spinal Column :

1, 1, Dorsal vertebrae; 2, 2, intervertebral cartilages; 3, 3, the anterior common ligament, extending like a ribband along the whole of the front of the vertebral column; 4, the neck, and 5 the head of rib; 6, 7, 8, three flat bundles of ligamentous fibres, radiating from the head of the rib to the adjacent vertebrae and intervertebral substances (they are removed in the lowest rib, seen in the figure); 9, the articulation between the tubercle of the ribs and the transverse vertebral process (From Gray's *Anatomy*).

considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior; this obliquity increasing to the 9th rib, and then slightly decreasing. They increase in length from the first to the eighth, and then again diminish. The spaces between the ribs are termed the *intercostal spaces*.

On examining a rib taken from about the middle of the series, we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facette being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebrae, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the tuberosity or tubercule, from whence the shaft commences. On the lower surface of this tubercule is a small oval surface, which articulates (as shown in fig. 2) with a corresponding surface on the upper part of the transverse process of the lower of the two contiguous vertebrae. The shaft presents an external convex, and an internal concave surface. A little in front of the tubercle, the rib is bent inwards, and at the same time upwards, the point where this bending takes place being called the angle. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of Mammals are mostly connected, as in man, with the bodies of two vertebrae, and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea, the posterior ribs hang down from the transverse processes alone. Their number, on each side, corresponds with that of the dorsal vertebrae. The greatest number, 23, occurs in the two-toed sloth, while in the Chiroptera, 11 is the ordinary number. In Birds, each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a 'diverging appendage,' which projects backwards over the next rib, so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebrae here never exceed 11, and are commonly 7 or 8 in number, and the ribs proceeding from them are connected with the sternum, not by cartilage, as in Mammals, but by true osseous sternal ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs.

In the Chelonian Reptiles, the ribs (as well as the vertebra and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of ankylosed ribs united by dermal plates. In the Crocodiles, there are only twelve pair of true or dorsal ribs; while in the other Saurians, and in the Ophidians, the ribs are usually very numerous. In the Frogs, there are no true ribs; the reason probably being, that any bony element in their thoracic walls would interfere with the enormous thoraco-abdominal enlargement which these animals periodically undergo at the breeding period.

Fig. 1.—The Ribs, in situ :

1 and 2 are the upper and middle parts of the sternum or breast-bone; 3, its ensiform cartilage; 4, the first dorsal, and 5 the last (or twelfth) dorsal vertebra; 6, the first rib; 7, its head; 8, its neck, resting against the transverse process of the first dorsal vertebra; 9, its tubercle; 10, the seventh or last true rib; 11, the costal cartilages of the true ribs; 12, the last two false ribs or floating ribs; 13, the grooves along the lower border of the ribs (from Wilson's *Anatomist's Vade-Mecum*).

column behind, and the sternum or breast-bone in front, constitute the osseous part of the walls of the chest. In man, there are 12 ribs on each side. The first 7 are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed *vertebro-sternal* or *true ribs*; while the other 5 are known as *false ribs*, and the last two of

In the language of the transcendental anatomists, a rib is to be regarded as a *Pleurapophysis*—one of the elements of a typical Vertebra (q. v.).

RIBS, FRACTURE OF THE, is a very common surgical accident, resulting from blows or falls upon the chest. Ribs may, moreover, be broken by mere pressure, as when persons are severely crushed in a crowd; and instances are on record in which, in the case of aged persons, the ribs have been actually fractured in violent coughing.

The treatment consists in the application of a broad flannel roller round the chest, so tightly as to prevent, as far as possible, all movement of the ribs, and to render the respiration abdominal rather than thoracic. The bandage must be prevented from falling by the addition of shoulder-straps; and in order to prevent the shoulder-blade from moving, and thus disturbing the broken ribs, some surgeons confine the arms to the side of the body. If one or both of the extremities of the fractured rib should perforate both the pleura, and wound the lung, air escapes in the act of inspiration from the lung into the pleural cavity, and from thence through the wound in the costal pleura into the cellular or areolar tissue of the trunk, giving rise to *emphysema*, in the form of a soft puffy tumor, that crepitates and disappears on pressure.

RICORD, PHILIP, a distinguished French physician, was the son of a wealthy ship-owner, and was born on the 10th of December 1800, at Baltimore, whither his father had gone in 1790, to repair his fortunes, which he had lost under the India Company. He came in 1820 to Paris, where he was attached in succession to the Hôtel-Dieu under Dupuytren, and to the Pitié under Lisfranc. He graduated as Doctor in Medicine in 1826; but was unable, from the scantiness of his private means, to begin practice in Paris. His professional career, therefore, commenced at Olivet, near Orleans, and was thence transferred to Croüy-sur-Oucre, where he rapidly rose to distinction as a practitioner. In 1828, he returned to Paris, where he delivered two annual courses of lectures at the Pitié on surgical operations; and was appointed surgeon-in-chief to the hospital for venereal diseases. This post he held with brilliant success till his retirement in October 1860. It was here that he won his world-wide reputation in the specialty which he had chosen—a reputation which he owed to his combination of accurate physiological and pathological knowledge, with great manual dexterity as a surgeon, and felicitous inventiveness and resource as a physician. He did much to improve the classification of enthetic diseases; and, at the Venereal Hospital delivered annually, from 1834, a course of lectures on Syphilology, for which a special amphitheater was granted to him. For his suggestions on the cure of varicocele and on the operation of urethraloplasty, he received in 1842 one of the Montyon prizes.

M. R.'s practice is the most extensive and the most lucrative in Paris, inasmuch that while an inmate of the debtors' prison at Clinchy, he was literally besieged by crowds of patients. He has been since 1850 Member of the Academy of Medicine (section of Surgical Pathology); Member of the Surgical Society; and consulting-surgeon to the Dispensary of Public Health. In 1862, he was appointed Physician in Ordinary to Prince Napoleon; and in 1869, consulting surgeon to the late emperor; having already on the 12th of August 1860 been raised to the distinction of Commander of the Legion of Honor. His works are numerous, the most important of them being these: *On the Employment of the Speculum Bivale* (1833), invented by himself; *On the Blennorrhagia of the Female* (1834); *On the Employment of Mercurial Ointment in the Treatment of Erysipelas* (1836); *The Monography of Chancre* (in which he gives a detailed exposition of his own system); *Theory of the Nature and Treatment of Epididymitis* (1838); *Treatise on Venereal Maladies* (1838); *On Blennorrhagic Ophthalmia* (1842); *Iconographical Clinic of the Venereal Hospital* (1842–1851); and *On Syphilisation and the Contagion from Secondary Accidents* (1853). He has also contributed to the medical journals a multitude of Memoirs, Observations, Researches and Communications on his specialty. His latest works are those entitled *Lectures on Syphilis* (3d ed. 1869), and *Lectures on Chancre* (2d ed. 1860), both remarkable for their fluency and grace of style.

RICARDO, DAVID, a political economist and statesman, was born in London on the 19th of April 1772. He was of Jewish extraction; and his father, who was a respectable member of the Stock Exchange, brought him up to his own business. There was an alienation between them on account of the son marrying out of the Jewish persuasion, and conforming to Christianity. Young R. practised in the Exchange until the year 1818, and whether from his own skill as a broker, or the favor extended to him on account of the position in which he was placed by his conformity, he realized a large fortune, preserving throughout his career in business an honorable reputation. While thus practically occupied, he was ardently working his way back to the first principles of political economy, and especially the finance department of it. In 1810, he produced a notable sensation by his pamphlet entitled *The High Price of Bullion a Proof of the De-*

preciation of Bank-notes. The title was a condensation of the principle worked out in the treatise, which gave one of the earliest distinct announcements of the principle of a metallic basis, and the propensity that a paper currency always has to redundancy, if it be not in some form or other restrained by the operation of such a basis. This was followed by several pamphlets, each in its turn a success in securing fame and influence. In 1817, appeared his principal work *On the Principles of Political Economy and Taxation*. He had previously in one of his pamphlets touched on the most important feature of this work—the elucidation of the true theory of rent, as not being incidental and casual, like the profits of stock, but a fund that must, under certain conditions of population, come into existence, whoever may draw it (see RENT).

Some critics of R. found that the elements of the theory were given in *The Bee* by Dr. Anderson (see ANDERSON, JAMES). R., however, who probably had not read *The Bee*, reached his conclusions in a different and original form, and from his happy method of elucidation, at once secured a general adhesion to the soundness of the theory, which was strengthened by comparing it with Anderson's remarks. R.'s work is one of the clearest and least tedious of all books on political economy. Like almost all works, however, written before free trade actually showed its power, it narrows the influence of the elements from which the riches of the world can be increased. Like Malthus, he was unable to anticipate the effect of an industrious people having the whole world for their market, and spoke of population outrunning subsistence, and the wages of labor being measured by the price of commodities. In 1818, he entered parliament, and kept his seat till his death. As he had a very clear method of announcing a principle, and being known as a successful man of business, his speeches had perhaps more influence in all matters of trade and money than those of any other member in the present century. He was a zealous student of geology, chemistry, and other sciences. He died on the 11th of September 1823.

RICA SOLI, BETTINO, Baron, born at Florence 9th March 1809, was descended from a very ancient Lombard family, which established itself in Tuscany in the 13th century. R. studied at Pisa and Florence, and from an early period of his life was imbued with a desire to ameliorate the civil and religious condition of his country. His friends and associates were men like Poerio, Pepe, Coletta, Giordani, Nicolini, &c. But he was averse to revolution, and finding no legitimate opening for himself in political life, quietly subsided into a country gentleman, and set about 'improving' his estates. He was one of the best agriculturists in Italy, and wrote works on the cultivation of the vine, of the olive, and of the mulberry. His wines of Chianti gained for him the cross of the Legion of Honor. In 1847, he appeared as a politician; but he hoped to obtain liberty and good laws from princes, and not from the people, and when Leopold II. fled to Gaeta, he retired from public life. Very soon, however, he joined with other Tuscan gentlemen, and after the defeat of Novara, he overthrew the government of Guerrazzi, and recalled the Grand Duke, trusting to the constitutional promises given by the latter.

Leopold returned, accompanied by the Austrians; and R., indignant at this treachery, sent back his decoration to the prince, and shut himself up in his castle of Brolio—addicting himself more than ever to agricultural pursuits. For ten years he worked successfully at the drainage of the Tuscan Maremma (q. v.). In 1859, when Tuscany wished to take part in the war of Italian independence, R. reappeared. The Grand Duke fled, and R. was made dictator of Tuscany. After Villafranca, he remained alone in the government, beset by the French emissaries, who were advising him to recall Leopold II. R. fiercely refused to do so; he wished the annexation of Piedmont; and to those who spoke of the dangers he was incurring, he answered in those words, which history will never forget: '*Dopo Villafranca ho sputato sulla mia vita*'—literally: '*After Villafranca I have spit upon my life*.' His obstinacy saved Italy, and produced the unity of the Peninsula. On the death of Cavour (1861), R. was called to the ministry, and by another abrupt and decided act, he promulgated political and administrative unity. His cabinet, undermined by Rattazzi, did not stand, and he therefore resigned (March 1862). R. returned to power in June 1866, and retired in April the following year, when he was succeeded by Rattazzi. He then retired from public life, for which the state of his health now unfitted him, and died 23d October 1880.

RICCI, MATTEO, a celebrated Italian, founder of the Jesuit missions to China, was born at Macerata, in the Marches of Ancona, October 6, 1552; and after studying law at Rome, entered the Society of Jesus in 1571. Six years later, he accompanied to India Père Valignan, 'Inspector-general of the Eastern Missions.' On account of his fine combination of zeal and tact, he was chosen by his superior to introduce a knowledge of the Christian religion into China, and after preparing himself for the arduous undertaking by a study of the Chinese language at

the Portuguese settlement at Macao, he endeavored to effect an entrance into the empire. But his first efforts were vain, and it was not till 1583 that the Jesuit Fathers obtained permission to settle at Tchao-king-fu. R. quickly saw that it was hopeless to attempt the conversion of the Chinese except by accommodating himself to their intellectual tastes and beliefs, as far as the principles of his religion permitted. Aware of the value which the ruling class—the mandarins—attached to literary skill, he executed and published a Chinese *Map of the World*, and also a little *Catechism*, in which he set forth only such portions of Christianity as embody the general principles of morality. These two productions won R. a high reputation among the Chinese *literati*; the most illustrious mandarins came to visit him, and expressed their esteem for his character and talents. In 1595, he boldly resolved to go to Peking, believing that he could accomplish far more as a religious propagandist in the metropolis than elsewhere. Having obtained permission from his superiors to assume the dress of a Chinese scholar, he set out in the train of a mandarin, who did not allow him, however, to proceed further than Nanking. Expelled thence, he was obliged to return homeward; but at Nan-tchang-fu, the indomitable and adroit priest composed two treatises, entitled the *Art of Memory* and a *Dialogue on Friendship*, in imitation of Cicero, which so pleased the taste of the Chinese, that they ranked them along with their most esteemed books, and the fortunate author was allowed to proceed north. He reached Peking, and although he could not obtain an interview with the sovereign, he was permitted to fix his residence at Nanking, the second city in the empire, where his fame as a scholar increased from day to day.

In 1600, he and his companions were allowed to settle at Peking, and even to build a church. He spent the remainder of his life in teaching mathematics and other sciences, in writing works of a secular as well as a religious kind, and in using his great influence with the king, the court, and the learned classes generally to obtain a favorable attention to the claims of that religion which he represented. R. made several striking conversions, and through his zeal, missionary establishments were set up in the principal cities of China. He died May 11, 1610, and was universally mourned. In the annals of the Chinese empire, he is designated sometimes *Li-ma-teou*, and sometimes *Si-thai*. The most important (for us) of his numerous writings are his Memoirs, published by Père Trigault, under the title of *De Christiana Expeditione apud Sinas suscepta ab Societate Jesu, ex M. Ricci's Commentariis Libri V.* (Augsb. 1615; Lyon, 1616), which contains a vast number of valuable observations on the geography and history of China. The family of R. possess 66 interesting letters of the great missionary.

RICCIO, or RIZZIO, DAVID, an Italian of considerable ability and accomplishments, who, in the reign of Mary Stewart, Queen of Scots, came to Edinburgh in the train of the ambassador from Savoy. His first employment at court was as a musician; but his skill and fidelity led Mary to advance him to the post of her French secretary, about the time of her marriage with Darnley; and in this situation he was believed to possess considerable influence over the queen. His advancement was distasteful to the nobles in general, but more especially to the party of the Reformers, who suspected him of intriguing with the papal court. He became obnoxious on other grounds to Darnley and his father, the Earl of Lennox. The former, who had for a time been on the most friendly footing with him, was easily led to believe not merely that he was the real obstacle to his favorite design of having the crown settled on him and his heirs, but also that he had supplanted him in the affections of the queen.

In this belief, he entered into a compact with the leaders of the Protestant party—including Murray, Ruthven, Morton—to assassinate R., and slay even in the queen's palace and presence whoever opposed them. Darnley formally bound himself to prevent the attainer of the conspirators, and procure their pardon, and to support and advance the Protestant faith, while the conspirators in return obliged themselves to procure the wished-for settlement of the crown in his favor. Accordingly, on the 9th March 1566, when Mary, then seven months with child, was sitting at supper in a small cabinet adjoining her bedroom, at Holyrood, attended by the Countess of Argyle, the Commendator of Holyrood, Beaton Master of the Household, Arthur Erskine, Captain of the Guard, and R., the king led the conspirators up a secret stair, while the Earl of Morton, with a troop of soldiers, seized the gates of the palace. Led by the king, the conspirators burst into the cabinet, overturned the table and threw themselves on R., who sprang for protection behind the queen. Ruthven drew his dagger; Ker of Fawldonside, it is said, held a pistol to the queen's breast; while George Douglas, natural son to the Earl of Angus, snatching the king's dagger, stabbed R. over the queen's shoulder, and dragging him from the cabinet, despatched him in a pool of blood, in the adjoining apartment, with fifty-six wounds. This murder was the first of a series of tragic events

in which Mary Queen of Scots was involved. John Knox, in his *History of the Reformation*, characterizes it as 'a just act, and most worthy of all praise.'

RICE (*Oryza*), a genus of grasses, having panicles of one-flowered spikelets, with two very small pointed glumes; the florets compressed, the palea strongly nerved, awned or awnless, six stamens, one germen, and two feathery stigmas. The only important species is the COMMON R. (*O. sativa*), one of the most useful and extensively cultivated of all grains, supplying the principal food of nearly one-third of the human race. It seems to

Rice (*Oryza sativa*).

be originally a native of the East Indies, but is now cultivated in all quarters of the globe, and almost wherever the conditions of warmth and moisture are suitable. It is adapted to tropical and sub-tropical climates, rather to the latter than the former; and requires much moisture, rather, however, in the soil than in the air. R. is an annual, varying from one foot to six feet in height. There are many other distinguishing characters of the varieties in cultivation; some having long awns, and some being awnless; some having the chaff (palea), when ripe, yellow, white, red, black, &c. The seed or grain of R. grows on little separate stalks springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and of oats. R. requires a moist soil, sometimes flooded; and the cultivation of it has in many places been attended with an increase of intermittent fevers, and of general unhealthiness, the rice-fields being artificially flooded at certain seasons. The cultivation of R. is most extensively carried on in India, China, Cochinchina, and other S.E. parts of Asia, Japan, Egypt, S. Carolina, Georgia, and other S. states of N. America. The quantity exported from India, whence we obtain our chief supplies, was, in 1871, estimated at 16,386,335 qrs. valued at £4,468,000. The total import into this country in 1880 was 7,889,710 cwts., value £3,755,199.

In some parts of the East, canals are carried along the sides of hills, in order to the irrigation of land for the cultivation of rice. In Carolina, R. is sown in rows, in the bottom of trenches, which are about 18 inches apart; the trenches are filled with water to the depth of several inches, till the seeds germinate; the water is then drawn off, and afterwards the fields are again flooded for rather more than a fortnight, to kill weeds. They are flooded again, when the grain is near ripening.—In Europe, the cultivation of R. is confined to the most southern regions. It is most extensively carried on in the plains of Lombardy, and in Valencia in Spain. Attempts have been made to cultivate it in more northern parts of Europe, but without success. Marshy situations, where there is always the same abundance of water, are not so suitable to R. as those in which the supply of water is regulated according to the season and growth of the plant.

Like most cultivated plants, it is very liable to variation, and in India and Ceylon, at least 120 known varieties are cultivated. The best of all R. known in the market is that of Carolina, yet the introduction of R. into that country took place only about the last years of the 17th or the first of the 18th century. Its cultivation there, however, rapidly extended.

R. is known in India as *Paddy*. Another use of this name is to designate R. in the husk.

In China, R. is generally sown pretty thickly on very wet land, and afterwards transplanted to the land which it is finally to occupy. The plants *tiller* or spread at the root very much, so that

each sends up several or many stalks. The rice-grounds are carefully kept clear of weeds, although often so wet that a man cannot walk in them without sinking to the knees. In many parts of China, and in other warm countries, it is common to obtain two crops of R. in a year.

R. is shelled and quickly dried before being brought to market. Good Indian R. has the following composition:

	Per cent.
Moisture.....	13.00
Nitrogenous Matter.....	7.44
Starch.....	77.63
Fatty or oily matter.....	0.70
Ash.....	1.23
	100.00

R. contains, therefore, according to the prevalent views of modern chemists, a smaller amount of *flesh-forming* substances, and a larger amount of *fat-forming* or *heat-giving* substances than any other grain. As a food, it is particularly well adapted for hot climates, as it appears to be almost a cure for dysentery and other bowel complaints, independently of which it is a sufficiently nutritious food without being heated. Owing to the small quantity of gluten which it contains, it is capable by itself only of an imperfect fermentation, and is unfit for being baked into bread. It is, however, subjected to fermentation in many countries. The beer made from R. by the Japanese is called *Saki*, and is in general use among them; but before being drunk, it is heated in kettles. Several kinds of *Rice wine* are made by the Chinese, some of them highly esteemed, and very intoxicating. A spirit is distilled from the lees, called *Shou-choo* or *Sam-choo*. The common Arrack (q. v.) of the East is made from rice, and rice is also employed to a very great extent by distillers in Britain.

Rice starch is made in considerable quantity in Britain. It is sold under the name of *Patent Starch*, and is used in laundries and muslin manufactories.—The straw of R. is used to make straw-plait for bonnets.

The refuse of R., which remains when it is cleaned for the market, and consists of the husk, broken grains, and dust, is valuable as food for cattle. It is known as *Rice-meal* and *Rice-dust*.

CANADA R. (*Zizania aquatica*), the WILD R. of North America, is a species of grass quite different from the true R., and of a different genus. It is common in North America, and particularly abundant in the north-western parts of it; growing in miry places and shallow water, often in the margins of lakes. It has a culm 7–8 feet high, with broad diffuse leaves, and a large terminal panicle of male flowers, with a spike of female flowers at the summit. The flowers have six stamens. The seeds are about half an inch long, slender, farinaceous, affording very good meal, and much used by the Indians where the plant abounds. Attempts to introduce this plant into Britain have hitherto proved unsuccessful; but there are many northern regions apparently more suitable to it, and it has not received all the attention it deserves.

RICE-PAPER. See PAPER.

RICHARD I., king of England, surnamed CŒUR DE LION, was the third son of Henry II. by his queen Eleanor. He was born at Oxford in September 1157. In the treaty of Montmirail, entered into 6th January 1169, between Henry and Louis VII. of France, it was stipulated that the duchy of Aquitaine should be made over to R., and that he should do homage for it to the king of France; also, that he should marry Adelais, youngest daughter of Louis. In 1178, R. joined his mother and his brothers Henry and Geoffrey in their rebellion against the king. The rebels submitted in September 1174, when two castles in Poitou were allotted to Richard. In 1183, a second family feud broke out in consequence of R. refusing to do homage to his elder brother Henry for the duchy of Aquitaine. In this war, his father sided with R. against Henry and Geoffrey. It was ended by the death of Prince Henry, when R., actuated probably by jealousy of his youngest brother John, declared himself the liegeman of France for his possessions in that country. This stepped to a war between the king of England and Philip of France, in which R. fought against his father. The balance of success being decidedly with France, a treaty in accordance with this fact was about to be executed, when, by the death of Henry II., on 6th July 1189, R. became king of England. He landed in his own country on 15th August 1189, and was crowned in Westminster Abbey on the 3d September following. In the hope of gaining salvation, and with the certainty of following the occupation which he loved best, he now set out with an army to join the third crusade, then about to leave Europe. He united his forces to those of France on the plains of Vezelai, and the two armies (numbering in all 100,000 men), marched together as far as Lyon, where they separated and proceeded by different routes to Messina, where they again met. Here R. betrothed his nephew Arthur to the infant daughter of Tancred, king of Sicily, with

whom he formed a close alliance. The Sicilian throne was at that time claimed by the Emperor Henry VI.; and the alliance with Tancred, from this cause, afterwards turned out a very unlucky one for Richard.

Having settled a difference which now arose between him and Philip respecting his old engagement to Philip's sister Adelais, the English king, on 7th April 1191, sailed from Messina for Cyprus, carrying along with him Berengaria, daughter of Sancho VI., king of Navarre. He had fallen in love with this princess, and he married her in the island of Cyprus, where he halted on his way to Palestine. But even love did not make him forget his favorite pastime of war: he attacked and dethroned Isaac of Cyprus, alleging that he had ill used the crews of some English ships which had been thrown on his coasts. Having then presented the island to Guy of Lusignan, he set sail on 4th June 1191, and on the 10th of the same month he reached the camp of the crusaders, then assembled before the fortress of Acre. The prodigies of personal valor which he performed in the Holy Land have made the name of Richard the Lion-hearted more famous in romance than it is in history. The man was the creation and impersonation of his age, and the reader who follows his career may perhaps be more interested than he would be by the lives of greater men, or by the history of a more important period. On 9th October 1192, he set out on his return to England. After some wanderings and adventures, he became the captive of the Emperor Henry VI., who shut him up in a castle in the Tyrol. John, meanwhile, ruled in England, and he and Philip of France had good reasons for wishing that R. should never return to his kingdom. He disappointed them; not, however, until he had paid a heavy ransom, and even, it is said, agreed to hold his kingdom as a fief of the empire. On 13th March 1194, he found himself once more in England. His brother John, who had acted so treacherously towards him, he magnanimously forgave, but with Philip of France he could not deny himself the pleasure of a war. In the contest which followed he was generally victorious, but in the end it proved fatal to himself. He was killed by an arrow shot from the castle of Chalus, which he was besieging, on 26th March 1199. If R. had the vices of an unscrupulous man, he had at least the virtues of a brave soldier.—See *Chronicles and Memorials of Richard I.*, by W. Stubbs, from MS. in Lib. of Corpus Christi Col., 1864.

RICHARD PLANTAGENET, second son of John, king of England, was born on 5th January 1208. In 1226, he was created Earl of Cornwall by his brother Henry III. In 1232, he put himself at the head of the party opposed to Hubert de Burgh, whose influence was at that time supreme in the councils of the king. Immense wealth, a calm, practical temperament, and a shrewd eye for his own worldly interest, were the elements which combined to make R. P. a considerable power in the state. His influence prevailed, and De Burgh was driven from his position with loss both of honors and estate. In 1256, R. P. was elected titular king of the Romans; and though his election was disputed, he was crowned at Aix-la-Chapelle. Subsequently, he exercised some of the nominal rights which belonged to his sovereignty. In the great struggle which took place between Henry III. and his nobles, R. P. at first acted the part of a mediator; subsequently, however, he took a decided part with his brother against the party which was headed by Simon de Montfort; and on 14th May 1264, he was taken prisoner by that leader at the battle of Lewes. De Montfort shut him up in Kenilworth Castle, from which he was released at the end of a year. The rest of his life does not seem to have been marked by any event of historical importance. He was thrice married: in 1230, to Isabel, daughter of the Earl of Pembroke; in 1243, to Sanchia of Provence, sister of Queen Eleanor; and in 1267, to Beatrice, daughter of Theodorick de Falkmonte. He died on the 2d of April 1272. His character seems to have been unmarked either by great virtues or great vices.

RICHARD II., king of England, the second son of Edward the Black Prince and Joanna of Kent, was born at Bordeaux on 3d April 1366. He succeeded to the throne on the death of his grandfather, Edward III., 28th June 1377. He being a minor, the government was vested in a council of twelve, from which were excluded the king's three uncles, John of Gaunt, Duke of Lancaster; the Earl of Cambridge, afterwards Duke of York; and the Earl of Buckingham, afterwards Duke of Gloucester. This arrangement is, however, supposed to have been collusive, and intended to lull the popular suspicion of Lancaster, under whose control the council really was. The reign of R. is interesting to the student of English constitutional history. We find the recently-established House of Commons eagerly pressing forward to procure a share of political power, by means of the efficient engine of which it had then acquired the sole control—the right of taxation. Again, we find the laboring classes now beginning to aspire to be freed from the state of bondage in which they had hitherto been kept. The famous capitation tax, in

posed in 1380, gave rise in the following year to the rebellion of Wat Tyler (q. v.). In June 1382, R. was married to Anne of Bohemia, daughter of the Emperor Charles IV. The next two years were occupied with a war with France, transferred in 1385 to Scotland, where for a while the king conducted it in person. In the absence of John of Gaunt in Spain, the Duke of Gloucester had put himself at the head of affairs; and an attempt which R. made at this time to free himself from control having been defeated, several of his counsellors were put to death, which step, on the part of the victorious party, was approved of by parliament, by whom further executions were ordered among the king's adherents; and the sentences were carried into effect. In 1389, however, R., by a sudden movement, succeeded in throwing off the yoke. Gloucester was obliged to retire; but from indolence and want of capacity, the king soon allowed the reins of government to slip from his own hands into those of the Duke of York, and Lancaster's son, Henry of Bolingbroke.

In 1394, the Queen died, and soon after a marriage treaty was concluded between R. and Isabella, infant daughter of Charles VI. of France. Gloucester reprobating this marriage, which seems to have been unpopular, R. caused him to be privately arrested and conveyed to Calais, where he died, or was murdered, as has been conjectured. On the meeting of parliament, the king had his own way; the Earl of Warwick was banished, and the Earl of Arundel beleaguered. Having triumphed over his foes, R. now began to quarrel with his friends. A misunderstanding having taken place between Bolingbroke and Mowbray, Duke of Norfolk, the king, desirous to be rid of both, sent the former into banishment for ten years, and the latter for life. But Bolingbroke had been assiduously cultivating the popularity which his cousin had been as assiduously throwing away; and the result became apparent in 1399. On his return, in that year, from a military expedition in Ireland, R. found that Bolingbroke had, in his absence, landed in England; that he had soon found himself at the head of a formidable army, and that the Duke of York, had yielded and gone over to his side. The army which the king had had with him in Ireland, also, no sooner landed than it almost entirely passed over to the invader. R. found himself without force or friend, while Bolingbroke, now styling himself Duke of Lancaster, was at the head of 80,000 men. Meeting the conqueror at Flint Castle, R. was carried captive in his train to London. On 29th September 1399, he formally resigned his crown. On the following day, the resignation was ratified by parliament, and the crown conferred on Lancaster. By order of the peers, R. was confined secretly in a castle, but where is not known. In the February following his resignation, the nation was told that he was dead, and his body, or what was supposed to be it, was brought with much pomp from Pontefract Castle, and shown to the people. There were rumors at the time of his having been murdered and long afterwards of his being alive and in Scotland. But nothing really authentic is known regarding the end of Richard II.

RICHARD III., king of England, was the youngest son of Richard Duke of York, and the great-grandson of Edmund Duke of York, the fifth son of Edward III. R. was born at Fotheringhay Castle on 2d October 1452. On the defeat and death of their father in 1460, he and his brother George, afterwards Duke of Clarence, were sent by their mother to Utrecht, where they remained for a short while under the protection of the Duke of Burgundy, until the crown was won by their eldest brother, Edward IV. In 1470, R. along with Edward remained in Flanders, whither they had fled on the success achieved for Margaret of Anjou by the Earl of Warwick. In 1471, he led the van of his brother's army at Barnet; he also rendered efficient assistance at the crowning victory of Tewkesbury. It is said that he and Clarence murdered Prince Edward, son of Henry VI., after the battle. It has also been popularly believed that he murdered Henry himself in the Tower. Now Duke of Gloucester, in 1472 he married Lady Anne Neville, daughter of Warwick and widow of Prince Edward. He has been generally accused of complicity in the judicial murder of his brother Clarence in 1478, and Shakespeare has placed the charge almost beyond the power of historical criticism to efface. The evidence, however, seems to be almost null. In 1483, on returning from an expedition into Scotland, he heard of the death of his brother the king. He met the Duke of Buckingham at Northampton, where it is believed that those measures were concerted which resulted in the execution of Hastings and others, the confinement in the Tower of the infant children of the late king, and the placing of the English crown on the head of Richard III. His reign dates from 26th June 1483. He was crowned at Westminster on the following 8th of July. For some time he seems to have been really popular. He was well received on a tour which he made in the northern counties.

On reaching York, however, on his return, he heard of a formidable insurrection which had broken out in the south in favor of his nephew, Edward V. But the bold and remorseless nature

of R. was on this occasion triumphant. It was soon known over the land that the royal children were dead. Little doubt has ever been held that they were murdered, or that the deed was done at the instigation of their uncle. The insurrection was quelled, and Buckingham, who had been at the head of it, found guilty of treason and executed. The parliament, which met on 23d January 1484, declared the issue of the late king to be bastard, and the property of the late rebels confiscated. R. now offered to marry the Princess Elizabeth, daughter of Edward IV., to his eldest son, Edward, on whose premature death he offered to marry the princess himself, his own queen being still alive. On the death of Anne, however, supposed to have been murdered by poison, on 16th March 1485, R.'s counsellors dissuaded him from marrying Elizabeth, on the ground of the popular indignation which the step was sure to excite. Meanwhile the crimes which his ambition had already led him to commit, had excited the deepest disgust both among nobility and people. One by one his adherents were dropping off, and crossing to France to join the Earl of Richmond. At last the storm burst. On the 7th August 1485, Richmond landed at Milford Haven. On the 21st of the same month was fought the decisive battle of Bosworth. It deprived Richard both of his crown and life, and decided the long war of the Red Rose and the White in favor of the House of Lancaster. R. was doubtless a man of great energy and ability, but in his aims, selfish and unprincipled. It must, however, be kept in view that his age was one in which human life was held of little value, and deception regarded almost as an accomplishment. See Life by J. H. Jesse (London, 1862.)

RICHARD OF CIRENCESTER—in Latin, *Ricardus Corinensis*—a well-known early English chronicler, was born at Cirencester in Gloucestershire, in the first half of the 14th c., but nothing whatever is known of his family or circumstances. In 1350, he entered the Benedictine monastery of St. Peter, Westminster—whence he is sometimes called the 'Monk of Westminster'—and remained there for the rest of his life. His leisure was devoted to the study of British and Anglo-Saxon history and antiquities. In the prosecution of his investigations, R. is said to have visited numerous libraries and ecclesiastical establishments in England, and we know for certain that in 1391 he obtained a license from his abbot to visit Rome. He died in 1401 or 1402. R.'s principal works are *Historia ab Hengista ad Ann. 1348*, in two parts, of which the first (preserved in the public library of Cambridge) treats of the affairs of England from the Saxon invasion to the death of Harold; two theological productions (in the Peterborough library), a *Liber de Officiis Ecclesiasticis*, and a *Tractatus super Symbolum Majus et Minus*; and above all his *De Situ Britannia*, a treatise on the ancient state of Great Britain. This work—of which, however, it must be admitted that the authenticity is doubtful—was, curious to say, first brought to light by Dr. Charles Julius Bertram, professor of English at Copenhagen in 1747, who professed to have discovered it in the Royal Library there, and who sent a transcript of it, together with a 'fac-simile' of the original, to the celebrated English antiquary, Dr. Stukeley. This gentleman published an analysis of it in 1757, and in the same year Professor Bertram published the whole treatise, along with the 'remains' of Gildas and Nennius, under the title *Britannicarum Gentium Historia Antiqua, Scriptores tres, Ricardus Corinensis, Gildas Badonicus, Nennius Banhorvensis*. A new edition with an English translation and a 'fac-simile,' and a biography of the supposed author, appeared at London in 1849, and a reprint forms one of the 'Six Old English Chronicles' in Bohn's 'Antiquarian Library' (1848). If we could feel quite sure that the work was genuine, it would be of the highest importance for the study of British and Roman-British antiquities, but unfortunately Bertram's 'original' (like the 'original' of Macpherson's *Ossian*, and Joe Smith's *Book of Mormon*) is not to be found, nor does it appear that anybody ever saw it but himself, so that Gibbon's praise, 'that he [Richard] shows a genuine knowledge of antiquity very extraordinary for a monk of the 14th century,' must be regarded with suspicion.

RICHARDSON, SAMUEL, the first great English novelist, was born in Derby in the year 1689. His father, though originally connected with a higher grade of society, was a joiner. It was his ambition to educate his son for the church; but for this means were found deficient, and at the age of 17, with simply such an education as a country school could then furnish, the young man fared forth to London, where he became apprentice to one John Wilde, a printer. In the discharge of his business duties he was exact and careful, and on the expiration of his apprenticeship he became foreman of Mr. Wilde's establishment. Some years afterwards, he started as printer on his own account in Salisbury Court, Fleet Street; and on finding his success assured, he wedded Miss Allington Wilde, the daughter of his late employer. After her death in 1731, he was again married to a Miss Leake. By each lady he was blessed with six children, of whom only four daughters along with their mother survived him. Throughout

life, in his business relations, he was prosperous; very early he had influence to secure the lucrative post of Printer of the Journals of the House of Commons; in 1754, he became Master of the Stationers' Company; and in 1760, he purchased the moiety of the patent of King's Printer; but died on 4th July of the year following.

Richardson's genius flowered late. Till he had turned 50, his relations with literature, except in the way of printing it, were of the most slight and amateur kind; but in 1740 he surprised the world with his *Pamela*, which had instant and great success. Its continuation, to which the author was stung by the attempt of some hungry scribe to make a meal or two by the issue of a pretended sequel, entitled *Pamela in High Life*, was, however, pronounced much inferior. Memorable in itself, the work is now to most readers more so, as having suggested to Fielding his *Joseph Andrews*, originally conceived as a parody of Richardson's somewhat prudish moralities. The exquisiteness of the satire was not appreciated by Richardson; and he never forgave Fielding for it, or could speak of him after with common temper or patience.

In 1748, he issued the first four volumes of *The History of Clarissa Harlowe*—by common consent his masterpiece—a work which in its progress to completion excited the most intense interest. His third and last great work, *The History of Sir Charles Grandison*, was published in 1753. As a whole, this is less interesting than its predecessors; and in his representation of the life of the fashionable classes, of which he had no clear personal knowledge, the writer succeeds but indifferently.

R.'s method of minute elaboration has in itself some tendency towards an effect of tedium; moreover, the epistolary vehicle which he has chosen, though with certain advantages of its own, does not subserve rapidity of movement; and as his stories run to immense length, their perusal involves some effort of patience. But in the depth and simplicity of his sentiment, his profound knowledge of the heart, and mastery of elemental emotion, there are singular sources of attraction; and in virtue of the overwhelming effects of pathos in which the interest of his *Clarissa* culminates, a place must always be assigned him among the very few potent masters of genuine tragic passion. His specialty lies in subtle analysis of the intricacies of female mind and emotion; and in this particular field he has scarcely perhaps been surpassed. A curious sort of passionless confidential intimacy with women, it seems from his earliest years to have been his instinct to cultivate; throughout life he was the center of a circle of female friends and admirers, who came to him with their little delicate secrets, as to a kind of lay father-confessor; and of the fruits of his nice observation of them he has given us to the full in his novels. The success of these is said to have bred in him a somewhat inordinate vanity, the only little flaw in a character unusually blameless and amiable. Of works of less importance he published, besides occasional contributions to periodicals, *The Negotiations of Sir Thomas Roe in his Embassy to the Ottoman Porte from 1621 to 1628* (1740, fol.); *An Edition of Æsop's Fables, with Reflections; Familiar Letters to and from several Persons on Business and other Subjects*; and in 1804 there appeared his *Correspondence Selected and Published, with a Biography by Anna Letitia Barbauld*.

RICHARDSON, SIR JOHN, K.C.B., M.D., LL.D., &c., a celebrated traveler and naturalist, was born November 5, 1787, at Dumfries, of which town his father, Gabriel Richardson, Esq., was several years provost. In his 14th year, he left the Academy of Dumfries to study at the University of Edinburgh, with a view to the medical profession. After obtaining his diploma, R. entered the royal navy, and in 1807 was appointed assistant-surgeon to the *Nymphæ* frigate, in which he was present at the battle of Copenhagen. Sometime later, the *Nymphæ* was engaged in the blockade of the Tagus, when, after twice volunteering to go in the boats on cutting-out expeditions, R. was transferred to the flag-ship. After the convention of Cintra the ships left the Tagus, and R. was nominated to the *Blossom* sloop of war, in which he served on the coast of Africa, Lord Exmouth removing him to the *Bombay*, 74, in 1810. His next services were in the *Cruiser*, on the Baltic and North Sea stations; afterwards surgeon of the 1st battalion of Royal Marines, stationed in Canada, and later doing service in Georgia, R. having charge of the hospital ship for the sick and wounded of the brigade. His next appointment, 1819, was that of surgeon and naturalist to the overland expedition under Franklin. In 1822, R. returned to England, and early in 1824 became surgeon to the Royal Marines at Chatham. In 1825—1827, he accompanied Franklin in his overland expedition to the mouth of the Mackenzie, and by orders of the Admiralty was detached to survey the coast between that river and the Coppermine, executing the task with singular success and ability. On returning from this expedition, R. resumed his duties at Chatham, remaining there till his promotion, 1838, to be physician of Haslar Hospital, and inspector of naval hospitals and fleets. In 1846, R. received the honor of knighthood; and two

years later, moved by genuine friendship and unsurpassed self-devotion, set out to search for and if possible save his former traveling companion, Sir John Franklin, of whom nothing had been heard for upwards of two years.

On March 25, 1848, R., accompanied by Mr. Rae, departed from Liverpool to look for the missing expedition between the Mackenzie and Coppermine Rivers. Landing at New York, R. hastened by way of Montreal and the Canadian lakes to the headwaters of the Mackenzie, which he descended, and then turned eastward by Capes Bathurst and Parry. Contrary to former experience, the sea towards Cape Krusenstern was found closely packed with dangerous drift-ice. After immense labor the party reached Cape Hearne, where it was found necessary to abandon the boats, and after 12 days' fatiguing march, through half-frozen swamps and over hills covered with snow, succeeded in gaining Fort Confidence, at the north point of Great Bear Lake. Here R. spent the winter in scientific observations, returning to England in 1849, and resuming his duties at Haslar. In 1855, R. tendered his resignation, after 48 years of almost unexampled activity in the public service. Moved in all his actions by a high sense of honor and sincere piety, possessed of the most unselfish nature, and a mind so acute as almost intuitively to form correct judgments, united with the humble and loving disposition of a child, R., during his long career, was one of the most lovable as well as useful men of the present century. Up till his death, 5th June 1865, he possessed much of the elasticity of youth; and whenever a scientific society assembled, he was found leaving for a time his quiet home by the Lake of Grasmere to take part in the deliberations.

R. was a fellow of the Royal Societies of London and Edinburgh, of the Royal Geographical Society, member of the Geographical Society of Paris, and of many other literary and scientific bodies in Great Britain, the continent of Europe, and America. He contributed largely to the account of Franklin's first expedition (Lond. 1823); and to that of the second expedition (Lond. 1828). In 1836, appeared *Fauna Boreali-Americana, the Fish; A Boat Voyage through Rupert's Land and the Arctic Sea* (Lond. 1851); *The Polar Regions* (1861). Besides zoological appendices to the voyages of Parry, Ross, Back, &c., his contributions to the Journals and Transactions of various societies have been very numerous. A recent work is the *Museum of Natural History*, in conjunction with several other distinguished naturalists.

RICHELIEU, ARMAND JEAN DU PLESSIS, CARDINAL, DUC DE, was born of a noble but impoverished family at Paris, September 5, 1585, and was educated for the military profession at the College de Navarre. On the retirement to a religious life, however, of his elder brother, who held the bishopric of Luçon, R., with a view to succeeding to this preferment, betook himself to ecclesiastical studies, and underwent the preliminary examination for his degree at the Sorbonne. In 1607, he was consecrated Bishop of Luçon at Rome by Cardinal de Givry, in presence of Pope Paul V., and for some time devoted himself zealously to the discharge of his duties in his diocese. At the States-General in 1614, being appointed one of the representatives of the clergy, he attracted the notice of the queen-mother by an address which he delivered in the presence of the young king, Louis XIII.; and by his appointment in 1616 as secretary at war and foreign affairs, the way seemed opened to his success in political life; but in one of the vicissitudes of state intrigue common at that period, he soon found it necessary to withdraw from court, and return to his diocese.

Meanwhile a rupture occurred between the queen-mother and the king, and R., through the agency of a very remarkable man—the celebrated Capuchin Father Joseph—whose fortunes thenceforward were inseparably united with those of R., succeeded in effecting their reconciliation (August 1620) and the restoration of the queen to her position at court. The foundation of R.'s influence in consequence was solidly laid; but he appears to have acted with much tact and patient forbearance. He formed an alliance with the powerful favorite, the Duc de Luynes, and in 1622 was named cardinal, and two years later, 1624, he was made minister of state—a position which, although frequently menaced, and constantly beset by every variety of court intrigue, he retained to the end of his life. His first important measure was the conclusion of the alliance with England, by the marriage of Henrietta, sister of the king, with Charles, then Prince of Wales, in 1624. His successful conduct of the war of the Valteline, an affair of much delicacy for a cardinal, as presenting the pope himself as the antagonist of France, tended still more to strengthen his power. His enemies, however, were constantly on the watch for opportunities of undermining his influence, and even of bringing about his death. The queen withdrew her favor, and the king, while he trusted him implicitly, never ceased to fear him. The crisis of the struggle took place December 11, 1630, when R. himself believed that his fate was inevitable. His disgrace, indeed, had been decided; the king, fearing

to meet him face to face, had refused him an audience. His attempts to force an entrance to the king at the Luxembourg were defeated; but Louis, in his weak fear of R., having withdrawn to Versailles, the cardinal there succeeded in obtaining 'an audience, and having once effectually overborne the weakness and alarmed the fear of the sovereign, his supremacy remained from that day firmly and irrevocably established. This famous day is known as *Le Journee des Dupes*.

The administration of R. forms an epoch in the history of the constitution of the kingdom of France, as well as of her relations with other countries. It is memorable for several great measures, or series of measures, through which the posture of affairs underwent a complete and permanent change. Of these, the first and the most lasting in its results was that by which the absolute authority of the sovereign was established. From the medieval period, the power of the French kings had been controlled, and in many cases overridden by the feudal privileges of the nobles; and in the stormy conflicts of the 16th and of the beginning of the 17th centuries, the power of the crown had often been reduced to a cipher. By a succession of vigorous and energetic, and it must be added not unfrequently unscrupulous measures, R. succeeded in breaking down the political power, and subduing the arrogant assumptions of the great families; the heads of several among which were brought to the scaffold, while not a few were condemned to life-long imprisonment. Among his most inveterate and most powerful adversaries was Gaston, Duke of Orleans, brother of the king; but R. triumphed over him, and even the queen-mother, Maria de Medicis, was obliged to bow before the unbending spirit of R., and to withdraw into exile at Cologne; and R., at the close of his career, delivered up the royal authority, which he had wielded for 18 years, almost without a single constitutional check upon its absolute exercise.

Another of the great enterprises of this minister was the overthrow of the Huguenot party as a political power, and a rival of the throne in France. The siege and capture of Rochelle, which he conducted in person (1638), was followed by the submission of the other Huguenot strongholds. R., however, secured for the Huguenot body a certain measure of religious toleration; and, on the whole, is confessed to have used his success in this conflict with moderation.

In the external relations of France, the great object of all his measures was the overthrow of the preponderance of Austria. With this view he did not hesitate to foment the internal disaffections of Germany, even allying himself with this design with the German Protestants, and even with the great champion of the Protestant cause, Gustavus of Sweden; and in connection with his anti-Austrian policy, he also took part with the disaffected Spanish provinces in the Netherlands. His designs on Belgium, however, failed of success. With similar views he lent his support to the revolt of Catalonia against Philip IV., and sent an army into Piedmont; nor is there any part of his foreign policy to which he adhered with such pertinacity to the very end of his life.

His internal administration of France has been severely criticised. He was reckless and unscrupulous in the use of means against his enemies, and the expenditure which his foreign wars entailed led to many and oppressive impositions. His own personal expenditure was magnificent even to prodigality, but he is acquitted of all sordid schemes of self-aggrandizement.

R. died at Paris, 4th December 1642. Notwithstanding his many distracting occupations, the writings which he left behind fill several volumes. Some of these, ascetical or controversial, were written before his entrance into political life. Of his later writings, his *Testament Politique* and his *Memoirs* have attracted much notice. He even indulged occasionally in literature, and wrote two plays of indifferent reputation. His letters are numerous, and many of them full of interest. He was a liberal patron of literature, and to him France owes the establishment of the Royal Printing Presses and the foundation of the French Academy.

RICHMOND, a market-town and parliamentary and municipal borough in the North Riding of Yorkshire, on the left bank of the Swale, 42 miles north-west of York. The parish church is chiefly in Gothic, but partly in Norman architecture; the grammar-school has an endowment of £270 a year, and attached to it are six scholarships. Though the trade of R. is now much less extensive than in earlier ages, iron and brass founding and tanning are carried on, and there are a paper and several corn mills. The borough returns one member to the House of Commons. Pop. of municipal borough in 1871, 4443; in 1881, 4502.

The Earldom of Richmond was conferred by the Conqueror upon his kinsman, Alan Rufus, Count of Bretagne; but came into the possession of the crown when Henry, Earl of Richmond, succeeded Richard III. as Henry VII. The title of Duke of Richmond was afterwards conferred by Charles II. upon his son Charles Lennox, in whose family it still remains. The castle, sur-

rounded by picturesque scenery, stands on a rock overlooking the river. In the vicinity are some ruins of a small monastery, founded in 1258.

RICHMOND, a rising town of Surrey, 10 miles west-south-west of London by railway, stands partly on the summit and declivity of Richmond Hill, and partly on the level right bank of the Thames. The rich and beautiful scenery of the vicinity is seen with advantage from the terrace, which stretches along the brow of the hill. The parish church contains the tombs of Thomson the poet, and of Edmund Kean the tragedian. The banks of the Thames are studded with villas, and around the town are numerous nurseries and kitchen gardens. Pop. (1881) 19,068, who derive their subsistence chiefly by providing for the wants of the immense number of visitors and pleasure-seekers who frequent the town, especially during summer.

R., which was formerly called Scheen or Sheen, received its present name from Henry VII., who named it after his own earldom. It was a royal residence in the time of Henry I., and since that time the sovereigns of England have frequently resided here, and here Edward III., Henry VII., and Elizabeth died. Richmond Park, 8 miles in circuit, is open to the public.

RICHMOND, the capital of Virginia, U. S. America, on the left bank of the James River, at the head of tide water, 150 miles from its mouth, lat. 37° 32' 17" N., long. 77° 27' 28" W., 100 miles south of Washington, picturesquely situated on the Richmond and Shockoe Hills, on the lower falls of the James River, and regularly laid out and built, and surrounded with beautiful scenery. The capitol is a stately building in the center of a park of 8 acres, the grounds of which are ornamented with trees and statuary. There are also handsome state and county edifices, penitentiary, theater, orphan asylum, 50 churches, 3 colleges, 7 daily and 14 other newspapers, several cotton and tobacco factories, extensive flouring-mills, forges, furnaces, and machine shops. Tobacco and flour are the principal articles of export from R. Vessels drawing 10 feet can come within a mile of the center of the city; those of 15 feet to three miles below. A canal round the falls gives a river navigation 200 miles further, and a canal and several railways connect it with the great network of southern railways. R. was founded in 1742. In 1811, the burning of a theater destroyed the lives of 70 persons, including the governor of the state. In June 1861 it was selected as the Confederate capital, and from that period was the objective point of a series of formidable military expeditions for its capture, under Generals M'Dowell, McClellan, Burnside, Hooker, Meade, and Grant, and defended by General Lee with a large army and formidable lines of fortifications, until the seizure of the lines of supply by Generals Grant and Sheridan compelled its evacuation after a series of sanguinary battles, April 3, 1865. A considerable portion of the city was destroyed by the retreating Confederates. Pop. (1870) 51,038; (1880) 63,803.

RICHMOND, a city of Indiana, U. S., on the east fork of Whitewater River, 70 miles north-west of Cincinnati, and the focus of several railways. It was founded by a colony of Friends in 1816. The river gives water-power to factories of cotton, wool, flour, and several extensive implement factories. R. has a brisk trade with a fertile and populous country. There are 20 churches and 8 newspapers. Pop. (1860) 6603; (1870) 9445; (1880) 12,743.

RICHTER, JEAN PAUL FRIEDRICH, better known as 'Jean Paul,' a German humorist and sentimentalist of the greatest singularity, hence called by his countrymen *Der Einzige* (The Unique), was born at Wunsiedel, in Bavaria, March 21, 1763. His father, who was a poor schoolmaster at the period of R.'s birth, subsequently became parish priest at Schwarzenbach, on the Saale; but his circumstances always remained straitened, and he died burdened with debt, while his son was attending the gymnasium at Hof. Nevertheless, R. went to the university of Leipzig in 1780 to study theology, which did not prevent him from roving freely over the whole circle of literature. The exact extent of his scholarly acquirements cannot well be ascertained; his studies were never systematic, and it is probable that he was not deeply read in any single branch of learning, but he carried in his head or in his note-books a vast confused miscellany of facts, literary, scientific, philosophical, and theological, and strewed them with original profusion over the pages of his works, where they do duty as metaphors, or illustrations after the most grotesque and wonderful fashion. The English satirists, Pope, Swift, and Young, appear to have been special favorites with him; and among his own countrymen, Hamann and Hippel. But the most marvelous thing about his student-life was not the extent or variety of his reading, but the fact that he had the heart to read at all! During the whole time he was plunged in the most miserable poverty. He could hardly get a single private pupil, and passed many a day without tasting food. Hunger was, in truth, his constant companion. In desperation he betook

himself to literature for a subsistence, but it was long before he won recognition.

His first composition, *Das Lob der Dummheit* (The Praise of Folly), modelled on the *Moria Encomium* of Erasmus, could not find a publisher; his second, written, he tells us, while he was surrounded by 'unpaid debts and unsold boots,' *Grönländische Prozesse* (Greenland Lawsuits, 2 vols., Berl. 1783—1785), did succeed in getting itself published but not read, and at length the heroic fortitude of R. gave way. In 1785, he fled from the city to avoid incarceration for debt, and took refuge with his mother at Hof. Here his circumstances were little better; and in 1786, he was glad to accept a tutorship at Töpen in the family of Herr von Oerthel. In 1790, at the request of several families of Schwarzenbach, he removed thither to take charge of the education of their children, and lived in this way as a private school-master for some years. Meanwhile, he had not given up authorship. In 1788, appeared at Gera his *Auswahl aus des Teufels Papieren* (Selection from the Devil's Papers), which, however, in spite of its captivating title, did not prove more popular than its predecessors. R. seemed destined to failure as a writer. His sarcastic, far-glancing, and grotesquely-sportful humors were so unlike anything else in literature, and so oddly, not to say extravagantly, expressed, that the mass of readers could make nothing of them at all, and perhaps charitably regarded the author as crazy.

But in 1793 the turning-point in his fortunes and fame occurred. In that year, a work which he had published at Berlin, *Die Unsichtbare Loge* (The Invisible Lodge), and which was a sort of romance based on his experience as a schoolmaster, proved unexpectedly successful, and R. began to grow a little more familiar with the sight of gold. It was followed by *Hesperus* (4 vols., Berl. 1794), the work by which he is perhaps best known out of Germany; *Quintus Fixlein* (Baireuth, 1796); *Biographische Belustigungen unter der Gehirnschale einer Riesin* (Biographical Recreations under the Cranium of a Giantess, Berl. 1796); *Blumen-, Frucht-, und Dornenstücke* (Flower, Fruit, and Thorn Pieces, 4 vols., Berl. 1796—1797), the opening chapter of which contains his magnificent 'Dream of the Dead Christ,' translated into English by Carlyle; *Jubelseniör* (The Parson in Jubilee, 1797); and *Das Campanerthal* (Erfurt, 1798), a work on the immortality of the soul, which attracted the notice and won for its author the friendship of Herder.

R. was now one of the greatest celebrities of Germany; his books had become quite the rage, especially among educated women. He himself, too, was personally a great favorite; there was something in his conversation and manner so winning, joyous, and charmingly tender, that it excited not only friendship but love. We read of one brilliant woman, Charlotte von Kalb, who actually sought to obtain a divorce in order that she might marry R.; and of another who committed suicide because he would not return her unlawful passion. This last incident affected R. profoundly. He was not only perfectly innocent in all his relations with the other sex, but pure and high-minded to a degree, and he had remonstrated with the unhappy maiden in the most wise and delicate manner. In 1801, after he had become famous, he married Caroline Mayer, daughter of Professor Mayer of Berlin, and with his young wife traveled about Germany a good deal, visited Goethe and Schiller, with neither of whom, however, he became intimate, and formed a closer acquaintance with old Gleim, Wieland, &c.; but ultimately settled at Baireuth, in Bavaria, where he devoted his time with the most honorable assiduity to work. His ærial, fantastic, many-hued creations—his solemn images of glory and gloom—his riant humors—his burlesque speculations on life, manners, and, indeed, on the *omne scibile*—his innumerable descriptions of nature, soft-glittering as with morning dew, flowed from him as from inexhaustible fountains. The productions belonging to his later period of a humorous kind are, *Titan* (4 vols., Berl. 1800—1803), considered by R. himself his greatest work; *Fliegel Jahre* (happily rendered by Carlyle 'Wild Oats,' 4 vols., Tüb. 1804—1805); *Katenberger's Badereise* (3 vols., Heidelb. 1809); *Des Feldpredigers Schmelzle Reise nach Flütze* (Tüb. 1809); and *Der Komet, oder Nikolaus Markgraf* (3 vols., Berl. 1820—1822).

Among works of a professedly reflective or philosophical character (though the elements of humor and poetry are by no means absent), we may mention his *Vorschule der Aesthetik* (3 vols., Hamb. 1804), *Levana oder Erziehungslehre* (Brunswick, 1807), a treatise on education; and numerous other pieces. R. died November 14, 1825. In his latest years he was afflicted with a decay of his physical powers, and in his last year with total blindness. The death of his son Max, in 1821—a youth of great promise—indicted an incurable wound on his heart.—See *Wahrheit aus Jean Paul's Leben* (Bresl. 1826—1833), a work begun by R. himself; *Döring's Leben und Charakteristik Richters* (2 vols., Leip. 1830); *Spazier's Jean Paul Friedrich Richter ein Biographischer Commentar zu dessen Werken* (5 vols., Leip. 1833). Some of his pieces have been translated into English by Carlyle and others; Carlyle has

also given us two admirable essays on the life, writings, and genius of the man, to which we refer our readers.

RI'CINUS. See CASTOR-OIL PLANT.

RI'CKETS, or RACHI'TIS (from the Gr. *rhachis*, the spine, because a peculiar form of spinal curvature results from the affection), is regarded by some writers as a special disease of the bones, and by others as merely one of the various forms of scrofula. Whichever view be correct, there can be no doubt that the general symptoms in rickets are closely allied to those in scrofula, and that the same general plan of treatment is equally useful in both affections. The characteristic symptom in rickets is the imperfect development, atrophy, softness, and consequent distortion of some or many of the bones. The bones thus affected consist of a sort of gelatinous tissue, which will bend without breaking; and they are so soft that they may be cut with the knife. On microscopico-chemical examination, the structural arrangement of the bone is found to be unaffected, while there is a great deficiency of the earthy salts to which the normal bones owe their firmness.

While 100 parts of healthy bone contain about 32 per cent. of organic matter, and 68 per cent. of inorganic matter, or earthy salts, the proportions are altogether reversed in rickets. Thus, in this disease, Marchand found 79.4 per cent. of organic matter, and 20.6 of earthy salts in a femur; while Ragsky found 81.12 per cent. of organic matter, and only 18.88 of earthy salts in a humerus: thus showing that these bones contained less than one-third of the normal quantity of earthy salts. The weight of the body acting on bones thus constructed causes them to bend, and the thighs or shins are abnormally arched, or the spine is curved, or, in slighter cases, only the normal form of the ankle is modified. In aggravated cases, the chest is so affected as to give rise to the condition known as *pigeon-breasted*; the lower jaw is imperfectly developed, and the teeth project; and the pelvis becomes so altered in form as to render future child-bearing in the highest degree perilous. Rickets is exclusively a disease of childhood, and generally attacks the children of the poor.

The treatment must be mainly directed to the improvement of the general health. Free exposure to pure, bracing air, sponging with sea-water, or sea-bathing if the little patient can bear it, an abundance of animal food, cod-liver oil, iron, and quinia, include all that need be said about general treatment. Dr. Druitt recommends a jelly containing phosphate of lime (with the view of restoring to the bones the salt in which they are specially deficient). It is well worthy of further trial, and may be prepared as follows: Boil about four ounces of ivory-dust in water for ten minutes; then strain off the water, and throw it away with the impurities which it has taken up. Add more water in which the dust should be stewed till the jelly is extracted, and the dust itself is soft enough to crush between the teeth. Lemon-juice, wine, sugar, or other flavoring ingredients, may be added; and the softened ivory dust should be eaten with the jelly.

When a child with crooked legs is brought to a surgeon, he must carefully ascertain whether the crookedness depends on mere relaxation of the joints, or whether it lies in the bones themselves. In the former case, the child will probably grow up straight when his general health improves; whereas in the latter case (if the femur or tibia is absolutely bent), the surgeon must give a very guarded opinion.

RICKMAN, THOMAS, a distinguished architect, was born at Maidenhead in 1776. He was unsettled in early life, and tried several employments both in London and Maidenhead. He managed his father's business of druggist for some time, and afterwards became a clerk in an insurance office. He seems to have always had a love for architecture, and to have studied it carefully. In 1808, he began to give his full attention to it, and wrote the classification of Gothic styles, which has rendered him famous. He first pointed out the features which distinguish the different periods of that style. He divided it into four periods, and called them Norman, Early English, Decorated, and Perpendicular (q. v.), and these names and the dates he assigned to them are still the most frequently used.

R. became after this an architect in Birmingham, and was employed to design a great many buildings, especially churches. He died in March 1841. His work is called *An Attempt to discriminate the Styles of Architecture in England from the Conquest to the Reformation*. It was first written for Smith's *Panorama of Science and Art*, and has passed through several editions; that by Parker of Oxford (1847) is the best.

RI'COCHET, in Artillery, is the bounding of a shot along the ground which takes place when a gun is fired low. Ricochet firing is found extremely useful both in its actual and moral effect in clearing the face of a ravelin, bastion, or other rather long line of fortification. If well directed, the ricochet shot bounding along will dismount guns, scatter the gunners, and greatly intimidate the garrison. Vauban first introduced ricochet firing at the siege of Philipsburg in 1688. The defence against this sort of attack

consists in earthen traverses along the threatened line, or in a bonnet (see *FORTIFICATION*) at the point of parapet nearest the enemy. In the field, ricochet, where the shot or shell is made to bound forward at least ten times, produces most disastrous and demoralizing effects on masses of cavalry and infantry, whom it hews down in long lines.

RIDDLE (Ger. *räthsel*), a paraphrastic presentation of an unmentioned subject, the design of which is to excite the reader or hearer to the discovery of the meaning hidden under a studied obscurity of expression. In the present day, the riddle is a mere *jeu d'esprit*—a sort of witty pastime for idle people; we only meet with it under the form of *Conundrum* (q. v.), but anciently—and its antiquity is very great—it held a far higher place, and was put to far more important uses, although in its inferior phase of *conundrum* it was likewise a part of the intellectual entertainment at Greek, and latterly at Roman banquets. Among the easterns, it naturally associated itself with their symbolical modes of thought, and was also, as it still is, abundantly employed for didactic purposes. The so-called Proverbs or sayings attributed to Solomon frequently assume the form of riddles. Josephus relates, on the authority of Dios, the Phœnician historian, and of Menander of Ephesus, that Hiram, king of Tyre, and Solomon had once a contest in riddles or dark sayings, in which Solomon first won a large sum of money from Hiram, but ultimately lost it to Abdomen, one of Hiram's subjects—a curious instance of philosophical gambling.

Every reader of the Old Testament is familiar with the riddle which Samson proposed to the Philistines, and the 'enigmas' (as the Septuagint has it) that the Queen of Sheba proposed to Solomon, though it is perhaps doubtful if the latter were more than hard or difficult questions plainly put. The riddle is found in the Koran, and several books of riddles exist in Arabic and Persian. It would appear that they were also known to the ancient Egyptians, while among the Greeks they were allied in the earliest times with the *oracula*, or mystic utterances of the inspired priests, and were generally, as is the case with Samson's riddle, in verse; but in Greece they first came into vogue about the time of the 'Seven Wise Men,' one of whom, named Kleobulos, as also his daughter Kleobuline, was celebrated for the composition of metrical riddles (*griphoi*), some of which are still remembered. Even the greater poets did not refuse to introduce the riddle into their writings, or to devote whole poems to the subject—as, for example, the *Syrinx*, commonly ascribed to Theocritus. Homer, according to a statement in Plutarch, died of chagrin at not being able to solve a riddle; and the riddle of the Sphinx (see *EDIPUS*) is probably the most celebrated in the whole circle of philosophical puzzles. Among the Romans, professional riddle-makers did not make their appearance till the latest period of Roman literature, the reason assigned for which is the superior gravity and earnestness of the Roman genius, which, it is said, did not easily find pleasure in such modes of intellectual activity. Appuleius wrote a *Liber Ludiciorum et Griphorum*, but it is no longer extant, and almost the only name we can fix upon is a certain Cælius Firmianus Symposius, whose riddles, comprising a hundred hexametrical triplets, are termed by Aldhelmus (8th c.), apparently with justice, *Carmina inepta*.

The riddle, but more perhaps as an amusement for the baronial hall on winter-nights, or for the monastic mess-room, than as a serious intellectual effort, was much cultivated during the middle ages. This character of lively or amusing puzzle it has ever since for the most part retained. Many specimens of what would now be termed 'riddle' or 'conundrum books' exist in French, English, and German collections of manuscripts, and were printed at an early period. One of these, entitled *Demands Joyous*, which may be rendered 'Amusing Questions,' was printed in English by Wynkin de Worde in 1511. Many of these 'joyous demands' are simply coarse jests; but others, again, illustrate the simple, child-like religious belief of medieval Christendom—e. g., Demand: 'What bare the best burden that ever was borne?' Response: 'The ass that carried our Lady when she fled with our Lord into Egypt.' Some are really fitted to excite risibility—e. g., Demand: 'What is that that never was and never will be?' Response: 'A mouse's nest in a cat's ear.'—What is the worst bestowed charity that one can give? 'Alms to a blind man; for he would be glad to see the person hanged that gave it to him.' The Reformation, at least in Protestant countries, checked, if it did not wholly stop, the merry pastime of riddle-making; but in the 17th c. it began to creep into favor again. Le Père Ménétrier, a learned Jesuit, wrote a grave treatise on the subject; and in France, riddles soon rivalled in popularity the madrigals and sonnets of the period. The Abbé Cotin was a famous fabricator of riddles, and published a *recueil* of his own and those of his contemporaries, preceded by a dissertation, in which he modestly dubbed himself *Le Père de l'Enigme* (The Father of the Riddle); but, as a French critic remarks, posterity has not recognized his paternity.

In the 18th c., the taste for the manufacture of riddles continued to increase, and most of the brilliant French *littérateurs*, such as Boileau, Voltaire, and Rousseau, did a little in this line, until, finally, the *Mercure de France* became a fortnightly repository of riddles, the solution of which was sufficient to make a reputation in society. In Germany, Schiller gave a broader development to the riddle. In his hands, it once again became something grave and sibylline, and obtained in expression a high degree of literary beauty and force. A good collection of the best riddles is to be found in Ohnesorgen's collection, entitled *Sphinx* (6 vols. Ber. 1833).

RIDGE, the upper angle of a roof, usually covered with lead or zinc, and sometimes with stone or tile. Ridges are often ornamented with a cresting or running design, and recently cast-iron has been much used for this purpose.

RIDING (Saxon, *trithing*, third part), a term applied to three parts into which the county of York is divided, termed respectively East, West, and North Riding. A similar division existed in several other counties in the anglo-Saxon period; there were the *laths* of Kent, the *rapes* of Sussex, the *parts* of Lincoln. The trithing, lath, or rape was formed of three or more hundreds, and presided over by a trithing-man or lath-grieve. In *Domesday Book*, we find Yorkshire divided, as at present, into three ridings, and subdivided into wapentakes. See *WAPENTAKE*.

RIDING-MASTER, an officer in the cavalry, military train, and artillery, whose duty it is to instruct the officers and men in the management of their horses. He is most commonly selected from the ranks; his pay is 9s. a day, rising by length of service to 10s. 6d. and 12s.; besides which, he receives £7 per troop per annum for riding-house expenses; and he is believed to make some profit out of this allowance. The riding-master has the relative rank of lieutenant, and, after an aggregate service of 30 years, including at least 15 years as riding-master, he has the right to retire on 10s. a day, with the honorary rank of captain.

RIDLEY, NICHOLAS, one of the most noted leaders of the Reformation in England in the 16th century, was a native of Northumberland, and born about the commencement of the century. He was educated at the foundation-school of Newcastle-upon-Tyne, and subsequently at Pembroke Hall, Cambridge. He became a Fellow of this college in 1524, and ultimately President. The spirit of the Reformation had already begun to penetrate the universities both of Oxford and Cambridge. Tyndale and Bileney had taught the new doctrines in the latter place; and Ridley, no less than Cranmer and Latimer, all Cambridge students about the same period, had probably caught something of their spirit. This reforming tendency was greatly strengthened by a tour on the continent of Europe, which he undertook on the completion of his studies. He encountered some of the most active Reformers abroad, and after a three years' absence, he returned, with his principles firmly grounded in favor of the new course of things. He became proctor to the university of Cambridge, and in this capacity protested against the claims of the papal see to supreme ecclesiastical jurisdiction in England. He was also chosen public orator, and, under the patronage of his friend Cranmer, advanced first to be one of the king's chaplains, and then, in 1547, nominated Bishop of Rochester. He distinguished himself by his vehement denunciations of the idolatrous use of images and of holy water, and very soon became one of the most prominent, as he remained one of the most consistent and inflexible supporters of the Reformed doctrines. He joined actively in the measures of Edward VI.'s reign, and on the deprivation of Bonner, Bishop of London, Ridley became his successor, three years subsequent to his elevation to the see of Rochester. In this high position he distinguished himself by his 'moderation, his learning, and his munificence.'

He earnestly promoted the Reformation, yet without bigotry or intolerance, he exerted himself in the foundation of Christ's Hospital, and of the hospitals of St. Bartholomew and St. Thomas in Southwark, the two latter of which have become eminent as schools of medicine—the former as a school of classical and general instruction. He assisted Cranmer in the preparation of the 41 articles, afterwards reduced to 39. On the death of Edward VI., he warmly espoused the unfortunate cause of Lady Jane Grey; and on its speedy failure, and the accession of Mary, his known connection with it, as well as his general activity in the cause of the Reformation, exposed him to the vengeance of the papal party, again ascendant. He was committed to the Tower in 1553, and in the subsequent year, when a convocation was convened at Oxford for the discussion of the doctrine of transubstantiation, he was removed thither along with Cranmer and Latimer, in order that he might engage in the discussion. It was not to be expected, however, that any good would issue from such a step as this. The discussion proved a mere pretence; the Reformers were adjudged defeated and obstinate heretics, and condemned to suffer at the stake. On the 16th October 1555, R. was led forth to execution, along with his friend and fellow-reformer, Latimer.

He suffered in front of Balliol College, cheerful, steadfast, and consistently enduring as he had been throughout his life. He was, according to Burnet, one of the ablest of all who advanced the Reformation in England. His character is pure, elevated, and self-denying. Foxe says of him he was 'wise of counsel, deep of wit, benevolent in spirit.' His gentleness wins our sympathy, while his scholarly and calm intrepidity excite our admiration.

RIENZI, COLA DI, the famous Roman tribune, was born at Rome in 1313. His parentage was humble, his father being a tavern-keeper, named Lorenzo (by abbreviation, Rienzo), and his mother a washerwoman. Until his twentieth year, he lived among the peasants of Anagni; then he returned to his native city, where he studied grammar and rhetoric, read and re-read the Latin historians, philosophers, and poets (Greek was scarcely yet known in Italy), and excited his imagination, while at the same time he colored his speech, with the prophetic enthusiasm of the inspired writers. The assassination of his brother by a Roman noble, whom he found it impossible to bring to punishment, is considered to be the incident that finally determined him to deliver the city, as soon as he was able, from the barbarous thralldom of the barons. He assumed the significant title of 'consul of orphans, widows, and the poor.' In 1343, he was appointed by the heads of the Guelph party spokesman or orator of a deputation sent to the papal court at Avignon to beseech Clement VI. to return to Rome in order to protect the citizens from the tyranny of their oppressors. Here he formed a close friendship with Petrarch, through whose assistance he obtained a favorable hearing from his Holiness, who appointed him notary to the City Chamber. In April 1344, R. returned home, and sought to obtain the countenance of the magistrates in his ideas of reform; but reform, he found, was impossible without revolution; yet he did not *conspire*, properly speaking, to the very last moment. During three years, he loudly and openly—perhaps even ostentatiously—menaced the nobles, for the enthusiasm of R. for a nobler and juster government, though sincere, was showy and vain. The reason why the nobles took no steps to crush him was because they thought him mad. At last, when R. thought he could rely on the support of the citizens, he summoned them together on the 20th of May 1347, and surrounded by 100 horsemen and the papal legate, he delivered a magnificent discourse, and proposed a series of laws for the better government of the community, which he termed *il buono stato*, and which were unanimously approved of.

The aristocratic senators were driven out of the city, and R. was invested with dictatorial power. He took the title of 'tribune of liberty, peace, and justice,' and chose the papal legate for his colleague, but reserved to himself the direction of affairs, after having, however, suggested the institution of a syndicate, to which he should be responsible. The pope confirmed the eloquent dictator in his authority; all Italy rejoiced in his success, and foreign lands, even warlike France (according to Petrarch), began to dread the reviving majesty of the Eternal City. A bright dream now seems to have flashed across R.'s imagination—the unity of Italy and the supremacy of Rome! Every great Italian has dreamed that dream from Dante to Mazzini. R. despatched messengers to the various Italian states, requesting them to send deputies to Rome to consult for the general interests of the Peninsula, and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and on the 1st of August 1347, two hundred deputies assembled in the Lateran Church, where R. declared that the choice of an emperor of the Holy Roman Empire belonged to the Roman people, and summoned Ludvig of Bavaria and Karl of Bohemia, who were then disputants for the dignity, to compare before him. This step was wildly impolitic. R. had no material power to enable him to give efficacy to his splendid assumption. The pope was indignant at the transference of authority from himself to his subjects; and the barons, taking advantage of certain ceremonial extravagances which the dictator had committed, and which had diminished the popular regard for him, gathered together their forces, and renewed their devastations. After some ineffectual resistance, R. resigned his functions, weeping all the while, and withdrew from Rome, which was entered by the barons two days after. His tenure of power had lasted only seven months. In the solitudes of the Neapolitan Apennines, where he found refuge, R. would seem to have recovered his enthusiasm and his faith.

Regarding his fall as a just chastisement of God for his love of worldly vanities, he joined an order of Franciscan hermits, and spent nearly two years in exercises of piety and penitence—all the while, however, cherishing the hope that he would one day 'deliver' Rome again. This ambition to play a distinguished part made him readily listen to a brother-monk, who, about the middle of 1350, declared that, according to the prophecies of Joachim of Flores, of Cyrillus, and of Merlin, R. was destined, by the help of the emperor Karl IV., to introduce a new era of

happiness into the world. R. betook himself at once to Prague, and announced to the emperor that in a year and a half a new hierarchy would be established in the Church, and under a new pope, Karl would reign in the West, and R. in the East. Karl, not knowing very well what to say in reply to such language, thought it safest to put the 'prophet' in prison, and then wrote to inform his friend the pope of the matter. In July 1351, R. was transferred to Avignon, where proceedings were opened against him in reference to his exercise of tribunitial power. He was condemned to death, but his life was spared at the earnest entreaties of Petrarch and others; and the next two years were spent in an easy confinement in the French papal city. Meanwhile the state of matters at Rome had become worse than ever. The great families were even more factious, more anarchical, more desperately fond of spilling blood than formerly; and at last Innocent VI. sent Cardinal Athonoz to re-establish order. R. was also released from prison, and accompanied the cardinal.

A residence was assigned him at Perugia; but in August 1354, having borrowed money, and raised a small body of soldiers, he made a sort of triumphal entry into Rome, and was received with universal acclamations. But misfortune had impaired and debased his character; he abandoned himself to good living, and his once generous sentiments had given place to a hard, mistrustful and cruel disposition. The barons refused to recognize his government, and fortified themselves in their castles. The war against them necessitated the contraction of heavy expenses; the people grumbled; R. only grew more severe and capricious in his exactions and punishments. In two months his rule had become intolerable, and on the 8th of October, an infuriated crowd surrounded him in the Capitol, and put him to death with ferocious indignities.

RIE'SENGEIRGE (giant mountains), a mountain range about 23 miles long by about 12 miles broad, between Bohemia and Prussian Silesia. See **BOHEMIA**.

RIE'SI, a town of Sicily, in the province of Caltanissetta, and 13 miles south from Caltanissetta. It is situated at the base of a mountain of the same name, not far from the left bank of the Salso. There are sulphur-mines in the mountain. Pop. (1871) 11,548.

RIE'TI (ancient, *Reate*), a city of Central Italy, in the province of Perugia, in Umbria, is situated at the foot of a hill, on the banks of the Velino, 45 miles north-east of Rome. It is walled, its streets are regular, and it has a fine cathedral, and many benevolent institutions. It is the seat of an archbishop. R. was a noted city of the Sabines. Pop. 12,900.

RIFF, THE, a portion of the coast of Morocco which extends from Tangier on the west to near the western frontier of Algiers, having a length of about 210 miles, with a breadth of 58. The name, in the Berber language, which is that of the inhabitants, signifies a mountainous and rugged coast. The Riff mountains, which stretch along near and parallel to the coast, are green and wooded, and are here and there intersected transversely by fertile valleys or deep ravines, each of them possessing its brook or rivulet, which descends to the Mediterranean. The R. region is separated from the parallel mountain chain south of it by an extensive, fertile, and well-watered plain, in which stands the city of Fez. The inhabitants of the R. are almost wholly Berbers, who are employed in feeding and breeding cattle, fishing, and occasional piracy. On account of the injuries inflicted by them on merchant vessels, most of the maritime states of Europe agreed to pay an annual sum as quit-money. However, in 1828, Austria declined further payment of the tax. A Venetian vessel was seized by the pirates, in the harbor of Rabat, but the arrival of an Austrian fleet off the port produced restitution of the ship and its cargo, as well as the formal renunciation of all further claims. France followed the same course by declaring war against the Sultan of Morocco, and obtained compensation, in 1844, since which period piracy has much diminished. Its example was followed by the Spaniards in 1859. The sultan, however, had always discountenanced piracy, but his authority in the R. was too weak to compel obedience.

RIFLE-BIRD (*Ptiloris Paradiseus*), a bird of the family *Urupidae* with a long curved bill, and in size about equal to a large pigeon. It inhabits the south-eastern districts of Australia, and is found only in very thick 'bush.' The male is regarded as more splendid in plumage than any other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green, of most brilliant lustre. The tail is black, the two central feathers rich metallic green.

RIFLED ARMS were invented for the purpose of remedying certain defects essentially connected with cylindrical smooth-bore guns. These defects, which are chiefly owing to atmospheric resistance, showed themselves in the erratic motion of the ball,

especially when fired at a long range, and arose from the following causes: *First*, The ball never fitted tightly, and, in consequence of this, its center was below the center of the bore. A portion of the explosive force of the powder escaped over the top of the bullet, and was not only wasted, but exercised a downward pressure on the ball, tending to squeeze it into the under side of the barrel, and so great was this pressure, that in guns of soft metal, as brass, a perceptible dint was produced after a few rounds. Another and more important consequence of the looseness of the ball was, that the action of the powder on it was necessarily irregular, and its resulting motion along the barrel was a series of oblique impacts, now against one side, now against the other, and the direction of its motion after expulsion was necessarily not in line with the axis of the barrel, and depended upon the side of the barrel with which it was last in contact.

Secondly, Balls can never be perfectly homogeneous, and the violent and sudden pressure of the exploded powder produces a slight change of shape; consequently, the center of gravity can never accurately coincide with the center of the sphere, the air resists its forward motion unequally, and true flight is precluded. *Thirdly*, As a consequence of the friction of the ball against the sides of the barrel, it acquires a rotatory motion, the direction of its rotation after expulsion being determined by the particular point of the muzzle with which it was last in contact. Thus, if it finally touched the top or bottom of the muzzle, the plane of rotation of the anterior surface of the ball would be in line with its progressive motion, and the rotation would be in an upward or downward direction; if it last rebounded from the right side, the plane of rotation would be in line with its path, and the rotation of the anterior surface from left to right, and so on. The ball, in its rapid flight, compresses the air in front, and produces a vacuum behind; the denser, because more compressed, air in front, attempts to rush round the sides of the ball to fill up the vacuum. Now (see fig. 1), let us suppose that the ball, while in rapid advance, is also revolving in a horizontal plane, and from left to right, the side A, whose rotation conspires with the motion of translation, resists, by its friction, the attempt of the air to reach the vacuum by that side; while the side B, whose rotation is against the motion of translation, conspires to aid the air in reaching the vacuum. It follows from this, that the air is denser in front of A than in front of B; its resistance on the side A is greater than that on B, and the ball, in consequence, is deflected towards the side on which the resistance is least (towards the right in this instance). If the ball struck the top of the muzzle, its revolution would be in a vertical plane in line with the barrel, and in an upward direction, under which circumstances the ball would tend, first, downwards from the first reason, and then upwards from the third; while, if it struck the bottom of the muzzle, the contrary would be the case.

These aberrations of the ball from its true theoretical path, as was evident to artillerymen, could never be wholly annihilated while smooth-bores were used, and they set themselves to discover how they might be counteracted. It occurred to them that this could best be managed by securing that the plane of rotation of the ball should be at right angles to its motion of translation, as the irregularities in its structure, which produce aberrations of the first and second kind, would thus act equally in all directions, producing an exact counterbalance, while the aberration from the ball's rotation would wholly disappear; and the constancy of the vertical transverse position of the plane of the ball's rotation was obtained by making one or more spiral grooves along the interior of the barrel.

As early as 1498, the citizens of Leipzig possessed the germ of the future rifle, for their arms had a grooved bore, but the grooves were straight. Not many years after, in 1520, Augustin Kutter (or Koster) of Nürnberg was celebrated for his rose or star-grooved barrels, in which the grooves had a spiral form. It took its name from the rose-like shape of the bore at the muzzle; and, setting aside superiority of workmanship subsequently developed, Kutter's arm was the veritable rifle, and to him, therefore, so far as history shows, is due the invention of this terrible weapon, which reduces the flight of the projectile to a question of the individual skill of the marksman. The spiral groove gives to the bullet, if it fits into the grooves, a rotation rapid in proportion to the force of the explosion and the sharpness of the twist in the spiral. This revolution of the bullet on its own axis keeps that axis, gravity excepted, in the line in which it leaves the piece.

In 1628, Arnold Rotsiphen patented a new way of 'making gonnies,' which, from a subsequent patent granted him in 1635, appears to have consisted, among other improvements, in rifling

the barrels. It would be tedious to enumerate the various principles of rifling which were tried during the two centuries following Rotsiphen—suffice it to say, that scarcely a form of rifling now prevails but had its prototype among the old inventions. The difficulty of mechanical appliances making the rifling true, deferred, however, their general introduction, and the cost of rifled arms limited their use to the purposes of the chase. The revolutionary government of France had rifles issued to portions of their troops, but they met with so indifferent a success that Napoleon recalled them soon after he came to power. In the Peninsula, however, picked companies of sharpshooters practised with rifles with deadly effect on both the English and French sides. During the American war, 1812–1814, the Americans demonstrated incontestably the value of rifles in warfare; but many years were yet to elapse before they were definitively placed in the hands of soldiers, many of those of every nation in the Crimea having fought with the ineffective and almost ridiculous 'Brown Bess.' Soon after the French invaded Algeria, they had armed the Chasseurs d'Orleans with rifles, to counteract the superior range of the Arab guns. The intility of the old musket was shown in a battle during the Kaffir war, where our men discharged 80,000 cartridges, and the loss of the enemy was 25 men struck. After experiments with the old musket, it was found that its aim had no certainty whatever beyond 100 yards. It was soon discovered that a spherical ball was not the best missile; one in which the longer axis coincided with the axis of the gun flying true—the relative length of the axis and the shape of the head being matters of dispute.

The first war-rifle was that of Captain Delvigne, proposed in 1826, and adopted for a few men in the French army; but this still included the old and rude plan of forcing the leaden ball through the grooves by blows of the ramrod, it being of course requisite that the projectile should occupy the grooves tightly. In 1842, Colonel Thouvenin invented a *carabine à tige*, in which the breech had a small pillar screwed into it, round which the powder lay, and on the end of which the bullet rested, its base being flattened out by the force of the ramrod. Colonel Delvigne added a conical bullet to this rifle, and the combined invention was issued to the Chasseurs d'Afrique in 1846. But the *tige*, or pillar, became bent by usage, and was found otherwise objectionable. It was superseded by using with a grooved barrel the Minié bullet, which, being made smaller than the bore of the piece, could be almost dropped into the barrel. It was of lead, and in its base it contained a conical recess, to receive the apex of a smaller iron cup. The force of the explosion drove this cup into the bullet, causing the lead to expand into the grooves of the barrel. (It is right, however, to state that this contrivance is claimed for a Mr. Greener as early as 1836.) The Prussians, meanwhile, had armed their troops with the needle-rifle (*Zündnadelgewehr*), now superseded by the *Mausers*. In England, however, no improvement took place until 1851, when 28,000 rifled muskets to fire the Minié bullet were ordered to be issued. Notwithstanding the many advantages of the Minié system, it was found defective in practice. Experiments were set on foot in all directions, and resulted in 1853 in the production of the Enfield rifle, which had three grooves, taking one complete turn in 78 inches, and fired a bullet resembling the Minié, except that a wooden plug was substituted for the iron cup. From 1853 to 1865, this was the weapon of the British army. In 1865, the adoption of Breech-loading Arms (q. v.), caused the Enfield to be converted into a breech-loader by fitting the 'Snider' breech mechanism to the Enfield barrel.

This arrangement was, however, only temporary, and after a most exhaustive series of trials before a special committee on breech-loading rifles, the Henry barrel was in 1871 adopted in conjunction with the Martini breech for the new small-bore rifle for the British army, now known as the Martini-Henry rifle. No fewer than 104 different kinds of breech-loading small-arms were submitted to this committee, who decided that the Henry .45-inch bore barrel 'was the best adapted for the requirements of the service,' on account of its 'superiority in point of accuracy, trajectory, allowance for wind, and penetration,' and also on account of its great durability. The Henry system of rifling is the invention of Mr. Alexander Henry, gunmaker, Edinburgh, and its essential peculiarity consists in the form of the rifled bore. Figs. 2 and 3 represent an end section of a barrel rifled on this system. The rifling forms 7 plane surfaces A (fig. 3), and the periphery of the projectile, which is indicated by the dotted circle C, touches the planes A, at the center. In addition to the bearing surfaces thus obtained, there are 7 angular projections B, which extend inward from the planes A, so that the apex of each of the projections B is concentric with the center of the surfaces of its contiguous planes A. These angular ridges fill up to a great extent the spaces between the angles of the planes A, and the periphery of the projectile, thus reducing the windage, and from their peculiar construction facilitating the expansion of the bullet to the major diameter of the bore, so that the rotatory or spiral motion

Fig. 1.

Horizontal section of a spherical bullet, the straight arrow showing the direction of its forward motion or motion of translation, and the curved arrows that of its motion of rotation. The ball, in this instance, is supposed to have struck against the right side of the muzzle.

of the projectile is obtained with greater certainty; at the same time, the figure of the projectile is so little altered that it traverses

Fig. 2.

Fig. 3.

through the air with less resistance, and consequently its flight is rendered more accurate.

The length of the Henry barrel is 32½ inches. The mean diameter of the bore is .450 of an inch, and the rifling takes one complete turn in 22 inches. Its bullet is solid, with a slight cavity in the rear, and weighs 480 grains, the charge of powder being 85 grains. The range, accuracy, and penetration of the 'Henry' barrel is nearly twice that of the present Enfield-Snider barrel, while the highest point of its trajectory at five hundred yards is 2 ft. lower, or 9 ft. as compared with 11 ft. The maximum range of the Henry barrel is about 3200 yards at an angle of 28° 15'. A new barrel has, however, been produced by the Royal Small-Arms Factory, and by 1883, has been issued for trial in small numbers. The grooves are of the form termed 'ratchet,' and are shallower and more numerous than in the Henry barrel, which it is intended to supersede. Their spiral is also sharper, viz., 1 turn in 15 inches, and the bore is reduced to .40 inch diameter. The cartridge for this barrel is more of a trumpet than a bottle shape; the bullet is lighter (384 grains), but the charge of powder remains the same (85 grains). The trajectory of this arm is very flat owing to its enormous muzzle velocity, viz., 1570 feet per second. It is also exceedingly accurate, and has a maximum range of over 4000 yards. As it is intended to retain the Martini breech action, the new rifle complete is called the Martini-Enfield.

The term magazine arms or repeating arms is applied to fire-arms which contain, or have attached to them, a case, holding from 4 to 10 (and more) cartridges, which, being in connection with the lock action of the weapon, supplies a reserve of ammunition which can be rapidly fired in cases of emergency; the arm is also capable of being used as a 'single loader' on ordinary occasions. The idea is an old one, the first practical application of which was the revolver, if we except certain ancient flint-lock weapons of a past age. The best-known systems at the present time are the Spencer, Winchester, Vetterli, Krag, Kropatchek, Burton, Hotchkiss, Green, Jarman, and Mannlicher. All the great powers are adopting some form of magazine rifle for army and navy.

As with small-arms, so with cannon, rifling is no new discovery. In the museum at St. Petersburg is a cannon which was rifled in nine grooves as early as 1615. In 1661, the Prussians experimented with a gun rifled in 13 shallow grooves. By 1696, the Germans had tried elliptical bores. From thence till 1833, many attempts were made to rifle cannon, with more or less success. In 1833 and 1836, Monsieur Montigny of Brussels tried rifled guns with considerable success. In 1845, Colonel Cavalli of the Sardinian service commenced experiments with his rifled cannon: two Swedish officers next produced rifled cannon; but none of these systems were permanently adopted. The Crimean war set inventors vigorously at work, and many admirable guns have resulted from their attempts, the great difficulty of the day being to decide which is most effectual. The first point was the metal; and here cast-iron was found quite useless, being incapable of resisting the explosion of the large charges necessary to force closely fitting projectiles through rifled barrels. Several plans were resorted to. Sir William Armstrong welds coils of wrought-iron round a mandrel into one homogeneous mass of extraordinary tenacity, which he again strengthens by similar rings round the breech. Mr. Whitworth forces rings of wrought-iron over the barrel by hydraulic pressure; the Woolwich system is to shrink coils of wrought-iron over an inner tube of mild steel toughened in oil, and it gives perfect satisfaction. The French rifle brass guns, and use small charges; having also guns of wrought-iron. The Austrians have made a new bronze alloy (the invention of General Von Uchatius) which has proved extremely strong; the Belgians have tried Bessemer's steel. The system of rifling was the next important matter. Mr. Lancaster adhered to his oval bore; Sir William Armstrong produced a bore rifled in a great number of small sharp grooves (this gun was adopted by the

British government); Mr. Whitworth retained a hexagonal bore; and the French government adopted a bore with two, and subsequently three rather deep spiral grooves.

After careful experiments, the Austrian, Spanish, Dutch, and Italian governments have concurred in the French system. These several bores are shown below in section. In the Armstrong, the rotation is communicated to the projectile by the latter being cased with lead, which the explosion forces into the grooves. The numerous fine grooves impart a very correct centering to the shot, and give extreme accuracy of range; but they render the gun a delicate weapon. In the Whitworth, the shot is constructed to pass freely through the spiral hexagonal bore, windage being prevented by a greased wad. Lancaster's shot are elliptical, to correspond with the bore. The French projectiles have ribs or studs of projecting metal to correspond to the grooves.

Fig. 4.

(The Ellipse of the bore in the Lancaster is exaggerated to show the principle.)

The Armstrong gun was officially adopted into the British service in 1859, as the best weapon then known, but it has been superseded by an improved version known as the Woolwich gun. This gun has a modified form of the French rifling; but generally with a larger number of grooves (from 32 to 38) according to size of gun.

The Americans have several types of rifled ordnance. Herr Krupp's cannon are famous over the world. The Gatling, mitrailleuse, and Nordenfeldt gun are rifled machine-guns, and may be described as either single or many barrelled, with a cartridge feeding, firing, and extracting arrangement, which permits of a continuous rain of bullets, either of the ordinary rifle calibre, or, as with the Nordenfeldt naval pattern, of an inch or so in diameter, capable of piercing the sides of torpedo boats. The machine is mounted for field service on a wheeled carriage with a large supply of ammunition. See REVOLVER; SHOT; SHELLS; FIRE-ARMS; CANNON.

RIFLEMEN are troops armed with rifles, and employed more or less as sharpshooters. The name has nearly lost all meaning, for the whole infantry are now riflemen; but as late as 1854, the riflemen were quite the exception, the army generally having the smooth-bore 'Brown Bess.' During the French war, the 60th and 95th Regiments were armed as riflemen, taught light infantry drill, and clothed in dark green. The 95th became the Rifle Brigade. For the Volunteer riflemen, see VOLUNTEERS.

RIGA, capital of the Russian government of Livonia, and next to St. Petersburg the most important Baltic seaport. It lies on the right bank of the Dwina, crossed here by a bridge of boats and a new railway bridge 10 miles from the mouth of the river at Dünaburgon, on the Gulf of Riga, where there is a fortress defending the Dwina. Ships come up to Riga. R. has ample railway connections with most part of Russia and Germany. It was till of late defended by walls and bastions. These are now removed; and the city proper is separated from its three suburbs by promenades on both sides of the encircling canal. A citadel stands on the north of R. The chief buildings are the cathedral, the church of St. Peter, the town-hall, and the ancient castle; also the modern bourse, theater, asylums, hospitals, and schools. Of more than a dozen stone churches, 7 are Lutheran, 4 Russian, 1 Anglican; and there are 10 wooden ones besides. R. possesses numerous official, literary, educational, and beneficent institutions. Its manufactures are mainly of cotton, machines, tobacco, starch, soap, candles, leather; and its large exports are chiefly flax, hemp, grain, linseed, and wood. Half of the total population (168,850 in 1880) are Germans; and of the remainder, half are Russians and half are Lithuanians.

R. was founded in the beginning of the 13th c. by Albert Buckshoeven, Bishop of Livonia, and soon became a first-rate commercial town, and member of the Hanseatic League. The

Teutonic Knights possessed it in the 16th century. In 1621, R. was taken by Gustavus Adolphus, and held under Swedish dominion till 1710, but was finally annexed to Russia in 1721.

RIGA, GULF OF, an inlet in the north-east of the Baltic Sea, washes the shores of the three Baltic Provinces, Courland, Livonia, and Esthonia. It is over 100 miles in length from north to south, and is about 70 miles in breadth. The islands of Oesel, Dagö, Mohn, and Worms stand in the entrance to it, and narrow the mouth of the gulf to a passage about 20 miles in width. The chief river which falls into the gulf is the Dwina. Sandbanks render navigation in some parts dangerous.

RIGGING, in a ship, is a combination of very numerous ropes to afford stability to the masts, and to lower and hoist the sails. Notwithstanding the complication which the cordage of a rigged ship presents at first sight to the eye, the arrangement is remarkably simple. In all substantial points, the rig of each mast is the same; to understand one is, consequently, to understand all. In the accompanying diagrams, the same notation is observed throughout, spars being shown by capital letters; sails by italic letters; *standing rigging*, by Roman numerals; and *running rigging*, by Arabic numerals. To avoid a confusing number of symbols and needless repetition, the corresponding ropes, &c., on each mast bear the same numbers, and in the key, the name of such rope *per se* is only given. To find the full title of a rope, it is necessary to prefix (unless it pertain to the bowsprit or gaff) the name of the mast (mizzen, main, or fore) to which it belongs. For example, the spars marked D are, counting from the left, i. e., the stern, called respectively mizzen-royal-mast, main-royal-mast, and fore-royal-mast; the standing-ropes marked IV, are the mizzen-stay, main-stay, and fore-stay; and the run-

are to raise and lower the upper masts and the yards, to trim the sails, to hoist the signals and other flags, and occasionally to furl the sails.

Fig. 3.

Spars, &c.—A, Mast; B, Topmast; C, Topgallantmast; D, Royal-mast; E, Yard; F, Topsail-yard; G, Topgallant-sail-yard; H, Royal-yard; I, K, Truck; L, Bowsprit; M, Jib-boom; N, Flying jib-boom; O, Martingale; P, Chains; Q, Top; R, Cap; S, Cross-tree; T, Topmast Cap; U, Gaff; V, Boom, or Spanker-Boom.

Sails.—a, Mainsail; b, Topsail; c, Topgallant-sail; d, Royal; e, Spanker.

Standing Rigging.—i, Shrouds; ii, Topmast Shrouds, crossed by Ratlings; iii, Topgallant Shrouds; iv, Stays; v, Top-mast Stay; vi, Topgallant Stay; vii, Royal stay; viii, Topmast Backstay; ix, Topgallant Backstay; x, Royal Backstay; xi, Flying jib-boom Martingale Stays; xii, Jib-boom Martingale Stays; xiii, Martingale Back-stays; xiv, Bobstays.

Running Rigging.—1, Lifts; 2, Topsail Lifts; 3, Topgallant-sail Lifts; 4, Royal Lifts; 5, Braces; 6, Topsail Braces; 7, Topgallant Braces; 8, Royal Braces; 9, Signal Halyards; 10, Jib-stay; 11, Flying jib-stay; 12, Sheet; 13, Peak Halyards; 14, Vangs; 15, Topping Lifts; 16, Spanker Sheet.

Each mast has the following standing rigging: at each side *shrouds* (I, II, III.), consisting of several very thick (usually plaited) ropes; in front, the *stay* (IV., V., VI., VII.); and behind, the *backstays* (VIII., IX., X.), coming down to the ship's sides behind the shrouds. Across the lowermost and topmast shrouds, thin ropes, called *ratlings*, are hitched horizontally, and form convenient ladders for the men to use in going aloft. The standing rigging of the lower mast reaches the chains on the ship's sides; while the shrouds of the topmast and topgallantmast are worked into the top, their stays to the tops of the masts nearer the bow in each case (the bowsprit serving as an anterior mast for the fore-rigging); all the backstays, however, are brought down to the ship's sides. In steamers, the mainstays require modification, in order to avoid the funnel; they are often adjusted on a plan similar to that of the backstays. The standing rigging of the bowsprit consists of the bobstays (XIV.), generally of chain; the martingale stays (XI., XII.), and martingale backstays (XIII.), which all exert an adverse pressure to that of the stays from the foremast, topmast, &c.

The *running rigging* is of four classes: 1. Lifts for the upper masts and the jib-boom. These are not shown in the diagrams, from the fact that they run parallel, and closely contiguous to the masts, topmasts, and bowsprit.

2. The lifts for the yards and sails. Each yard has two lifts, one proceeding from a point near either extremity, and passing through a pulley at the head of that section of the mast to which the sail or yard belongs. They are worked either on the deck or in the top. The yard-lifts are shown by the numbers 1, 2, 3, 4. The gaff and boom have separate lifts working into the mizzen-top (13, 15). Each jib-sail has a lift (not shown), which acts parallel and close to IV., V., 10, or 11. If the ship carry stay-sails, there will be lifts parallel to the main and mizzen topmast stays and higher stays.

3. The ropes for adjusting the sails when spread. These comprise, first, the sheets for hauling down the lower corners of each sail—specimens are shown at 12; secondly, the braces for turning the yards about, to trim the sails to the wind. Each yard has two braces, one from either end passing to an adjoining mast, except the main braces, which are brought to the ship's side near the stern. The braces are shown at Nos. 5, 6, 7, 8. The vangs and

Fig. 1.

Fig. 2.

ning-ropes bearing the figure 5, are mizzen-braces, main-braces, and fore-braces.

Rigging is either *Standing* or *Running*. The former is employed in maintaining, in fixed position, the masts and bowsprit; the latter runs freely through numerous blocks, and its functions

spanker sheet (14, 16) perform similar offices for the spanker. There are minor ropes in connection with the sails, for assisting in furling, reefing, spreading, &c.; but it would have rendered the diagram too complicated to have inserted them.

4. Ropes in connection with the flags. Each mast has at its head a *truck*, containing two or more small pulleys. Over each of these, a thin halyard is passed, and brought down double to the deck. On these, any required flag is rapidly bent and hoisted with great ease. There are two pair of similar halyards to the gaff-peak; and when the ship is to be decorated on any festive occasion, similar halyards are affixed to the end of each yard-arm.

In different classes of ships, slight modifications occur in the rigging, to suit particular circumstances, but the main principles of rigging are as detailed above for all sizes of decked vessels. See SAILS.

RI'GHI, a mountain of Switzerland, in the canton of Schwyz, between Lakes Lucerne, Zug, and Lowerz, is isolated, and commands extensive views of some of the finest Swiss scenery. It is easily accessible; six mule-paths and the R. railway opened in 1871, lead to the summit, which, though it forms an admirable natural observatory in favorable weather, is only 5905 feet above the sea. Verdant pastures clothe the entire summit, and the slopes are belted with forests. Crowds of tourists, of both sexes, ascend the R. every season, in order to enjoy the fine views, which, in clear weather, it commands. There is a large hotel at the top, where tourists pass the night, in order to see the sun rise. The native spelling is *Rigi*.

RIGHT, in Legal language, is that kind of interest or connection with a subject-matter which serves as a foundation for an action or suit, or other protection of a court of law or equity; and hence it means an interest that can be enforced, for if it is such as a court of law or equity cannot take notice of, it may be called a natural or moral, but it is not a legal right. Strictly speaking, right merely means a relation between external nature and some person or other, and therefore there is no such thing as abstract rights, for a right is only intelligible when predicated of some person who can exercise or enforce it. There is an old practical division of all rights into rights of the person and rights of things. In the former class are included such divisions as rights of personal security and liberty; rights connected with marriage, infancy, &c.; while in the latter class are included the general rights arising out of the possession of real and personal property. There are various subjects which do not fall under either division exclusively; indeed, none of the usual divisions of rights can be said to be more than vaguely descriptive of their subjects.

It might naturally be expected that the correlative legal expression for rights should be wrongs, but this is not the case, the word wrong being used technically to mean only that class of infringements of one's rights which are connected with the person or the personal use of property. Thus, the refusing or withholding payment of a debt is not correctly called a legal wrong; but an assault or injury to one's person, or to one's property, irrespective of any contract, is properly called a wrong or a tort. The word right is also used more or less technically, in a narrower sense. An action, called a writ of right, had for its object to establish the title to real property; but it was abolished, the same object being secured by the order of ejectment. A *petition of right* is a proceeding resembling an action by which a subject vindicates his rights against the crown, and recovers debts and claims, the first step being a petition, which is allowed by the home secretary, and referred for trial to a court of law. A *right of way*, is a right of a private owner or occupier to a way over the land of an adjoining proprietor, as incidental to his possession of a house, or premises, or land. *Right of action*, means simply a right to commence an action in one of the courts of law to recover damages or property. *Right of common*, means a right of one, who is not the owner or occupier of waste land, to send cattle to graze upon it, or to cut turf, or exercise some partial right of property over it. *Right of entry*, is a right to possess and use land or premises, &c.

RIGHTS, DECLARATION AND BILL OF. The convention which called the Prince and Princess of Orange to the throne of England, set forth, in a solemn instrument known by the name of the *Declaration of Rights*, those fundamental principles of the constitution which were to be imposed on William and Mary on their acceptance of the crown. This declaration, drawn up by a committee of the Commons, of which Mr. (afterwards Lord) Somers was chairman, and assented to by the Lords, began by declaring that King James II. had committed certain acts contrary to the laws of the realm. The king, by whose authority these unlawful acts had been done, had abdicated the throne; and the Prince of Orange having invited the estates of the realm to meet and deliberate on the security of religion, law, and freedom, the Lords and Commons had resolved to declare and assert the

ancient rights and liberties of England. It was therefore declared, that the power of suspending and of dispensing with laws by regal authority is illegal; that the commission for creating the late Court of Commissioners for Ecclesiastical Causes, and all commissions and courts of the like nature, are illegal; that the levying of money for the use of the crown by prerogative, without grant of parliament, is illegal; that it is the right of the subjects to petition the king, and all prosecutions for such petitioning are illegal; that the raising or keeping of a standing army in time of peace, except with consent of parliament, is illegal; that Protestant subjects may have arms for their defence; that the election of members of parliament should be free; that freedom of speech in parliament should not be questioned in any place out of parliament; that excessive bail ought not to be required, or excessive fines imposed, or cruel or unusual punishments inflicted; that jurors should be duly impaneled, and that jurors in trials for high treason should be freeholders; that grants and promises of fines and forfeitures before conviction are illegal; and that for redress of all grievances, and the amendment, strengthening and preserving of the laws, parliaments ought to be held frequently.

All these things the Lords and Commons claimed as their undoubted rights and liberties; and having done so, they resolved that William and Mary should be king and queen of England for their joint and separate lives, the administration being during their joint lives in William alone; and that on their decease the crown should descend to the issue of the queen, then to that of Anne and her posterity, and, failing them, to the issue of William.

This Declaration of Rights was presented to the Prince and Princess of Orange at Whitehall, and accepted by them along with the crown. Being originally a revolutionary instrument, drawn up in an irregular assembly, it was considered necessary that it should be turned into law. The Declaration of Rights was therefore brought forward in the parliament, into which the convention had been turned, as a Bill of Rights, and passed the Commons; but an amendment proposed in the Lords regarding the settlement of the crown on the issue of the Princess Sophia, in the event of Mary, Anne, and William all dying without issue, led to several ineffectual conferences between the two Houses, which ended in the measure being dropped. The bill was, however, reintroduced in the following session of parliament (1689) without the proposed amendment, when it passed both Houses, and obtained the royal assent—a clause, however, being added, which originated in the House of Lords, to the effect that the kings and queens of England should be obliged, on coming to the throne, in full parliament or at the coronation, to repeat and subscribe the declaration against transubstantiation, and that a king or queen who should marry a papist would be incapable of reigning in England, and his subjects would be absolved from their allegiance.

RIGHTS OF MAN, a famous statement of rights, principally drawn up by Dumont, author of the *Souvenirs de Mirabeau*, and solemnly adopted by the French National Assembly on the 18th August 1789. It declares that all mankind are originally equal; that the ends of the social union are liberty, property, security, and resistance to oppression; that sovereignty resides in the nation, and that all power emanates from it; that freedom consists in doing everything which does not injure another; that law is the expression of the general will; that public burdens should be borne by all the members of the state in proportion to their fortunes; that the elective franchise should be extended to all; and that the exercise of natural rights has no other limit than their interference with the rights of others. Mirabeau endeavored in vain to induce the Assembly to postpone publishing any declaration of rights until after the formation of the constitution; but the deputies, feeling that a contrary course might imperil their popularity, issued the declaration—a proceeding which Dumont himself afterwards compared to placing a powder-magazine under a building, which the first spark of fire would blow into the air. Louis XVI., under the pressure of the events of the 5th of October, after first refusing, was induced to yield his adhesion to it. The dogma of the equality of mankind on which the declaration rests, had before been set forth in the American Declaration of Independence of 1776. Thinkers are now much less inclined than they were in the age of Rousseau to build social theories on such abstract, *a priori* assumptions; and the truth of this doctrine of original equality is directly impugned. Dumont himself asks: 'Are all men equal? Where is the equality? Is it in virtue, talents, fortune, industry, situation? Are they free by nature? So far from it, they are born in a state of complete dependence on others, from which they are long of being emancipated.'

The principles laid down in the *Rights of Man* were attacked by Edmund Burke in his *Reflections on the French Revolution*, who represented the declaration as a digest of anarchy. It was in reply to Burke's *Reflections* that Thomas Paine published in London his *Rights of Man*, an apology for, and commentary on,

the principles of the French constitution, for which he was prosecuted for libel on an information by the attorney-general, and found guilty.

RIGID DYNAMICS is that portion of theoretical Dynamics (q. v.) which, based on the theory of the free and constrained motion of *points*, applies the principles thence deduced to a *system* of points rigidly connected, so as to bear throughout the whole continuance of their motion the same invariable position with relation to each other; in other words, as no body in nature can be considered as a point, but is truly a system of points, rigid dynamics has for its aim to apply the abstract theory of dynamics to the cases actually occurring in nature. For a long time, problems of this sort were not resolved by any general and adequate method, but each class was worked out according to a method specially applicable to its particular circumstances. The great general principle discovered by the French geometer, commonly known as *D'Alembert's principle*, which applies equally to all such problems, and removes the necessity for specially investigating each particular case, was an inestimable boon to mechanical science. It is thus stated in his *Traité de Dynamique*: 'In whatever manner a number of bodies change their motions, if we suppose that the motion which each body would have in the following moment, if it were perfectly free, is decomposed into two others, one of which is the motion which it *really* takes in consequence of their mutual actions, then the other component will be such, that if each body were impressed by a force which would produce it alone, the whole system would be in equilibrium. In this way every dynamical problem can be compelled to furnish an equation of equilibrium, and so be changed into a problem of *Statics* (q. v.); and thus the solution of a difficult and complex problem is effected by means of the resolution of a much easier one. D'Alembert applied his principle to various problems on the motions and actions of fluids, the precession of the equinoxes, &c.; and subsequently, in a modified form, the same general property was made the basis of a complete system of dynamics, by La Grange, in his *Mécanique Analytique*.

RI'GOR MO'RTIS is the term usually given to the peculiar temporary rigidity of the muscles that occurs shortly after death. It begins immediately after all indications of irritability (see **MUSCLE**) have ceased, but before the commencement of putrefaction. In the human subject it most commonly begins to show itself about seven hours after death, although cases are occasionally met with in which 20, or even 30, hours may have elapsed before it begins to appear. This condition of rigidity usually lasts for about 30 hours; but it may pass off in ten hours or less, or may be prolonged to four or six days. The muscles of the neck and lower jaw are first affected, then those of the trunk, then those of the upper extremities, and lastly those of the lower extremities. In its departure, which is immediately followed by decomposition, the same order is followed.

This subject has been admirably discussed by Dr. Brown-Sequard in the 'Croonian Lecture' for 1861, and contained in *The Proceedings of the Royal Society* for that year. In this lecture he examines successively the relations existing between muscular irritability, *post-mortem* rigidity, and putrefaction, in a variety of cases. The following are his chief conclusions: 1. Paralyzed muscles are endowed with more irritability than healthy muscles; cadaveric rigidity sets in late, and lasts long; and putrefaction appears late, and progresses slowly. 2. Experiments made on numerous animals show that when muscular irritability is increased by a diminution of temperature, the increase has the same effect upon rigidity and putrefaction as when it is caused by paralysis. As a general rule, when there was a difference of 14° to 18° F. in the temperature of two animals of the same age and species, irritability and rigidity lasted twice or three times longer in the cooler animal than in the other, and putrefaction in the former was much less rapid.

3. It was maintained by John Hunter that cadaveric rigidity does not take place after death by lightning; but it is now known that this view is not generally true. When lightning destroys life by producing such a violent convulsion of every muscle in the body that muscular irritability at once ceases, the ensuing rigidity may be of such short duration as to escape notice; but if it causes death by fright, hæmorrhage, or concussion of the brain, cadaveric rigidity will appear as usual. 4. In animals that have been over-driven, hunted to death, &c., rigidity comes on very quickly, lasts for a very short time, and is rapidly succeeded by putrefaction; and various facts quoted by Brown-Sequard show that over-exertion acts similarly in man. 5. The nutrition of the muscles exerts a modifying influence on rigidity and putrefaction. In cases of death from decapitation, strangulation, sudden hæmorrhage from a wounded artery, &c., cadaveric rigidity does not begin till 16 or 18 hours after death, and lasts from six to eight days; while in a case of death from exhaustion, after a prolonged typhoid fever, rigidity became evident within three minutes after the last breathing, while the heart was still beating;

disappeared in a quarter of an hour, and was at once succeeded by signs of putrefaction before the man had been dead an hour. 6. When death follows violent and prolonged convulsions (as in cases of tetanus, hydrophobia, &c.), cadaveric rigidity sets in soon (usually within an hour after death), and ceases before the end of the tenth hour; and when the convulsions were caused by strychnine, similar results were obtained.

From these facts this accomplished physiologist deduces the general law, that 'the greater the degree of muscular irritability at the time of death, the later the cadaveric rigidity sets in, and the longer it lasts, the later also putrefaction appears, and the slower it progresses.'

The exact cause of this rigidity is not accurately known. The old view that it depended on the coagulation of the blood is no longer tenable. It most probably results from the spontaneous coagulation of a fibrinous material contained in the muscular juice.

R'IGVEDA, the first and principal of the four Vedas. See **VEDA**.

RI'MA-SZO'MBATH, a market-town of Hungary, on the river Rima, 23 miles north-east of Pesth. Articles in wood are largely manufactured, and there is a trade in linen and bullock's hides. Pop. (1880) 4500.

RI'MINI (ancient *Ariminum*), a city of Central Italy, province of Forlì, in Romagna. It is situated on the river Marecchia, and though the ancient harbor has been gradually filled up by the sands brought down by that stream, the port is still the resort of a large number of vessels engaged in fisheries, which employ nearly half the pop. of the town. Pop. (1871) 10,000. R. has fine streets, well-built houses, a handsome town-hall with porticoes, many fine churches, among others the cathedral built by Leon Battista Alberti, the interior of which is full of monuments; outside it is adorned with sarcophagi. It has a library, many superior schools, and two orphan asylums. Among its ancient monumental edifices still remaining, may be numbered the marble Bridge of Augustus over the Marecchia, and the marble Arch of Augustus. Its manufactures are glass and sail-cloth. R. was founded by the Umbri; it was conquered by the Romans, sacked by Sulla, frequently destroyed by the Barbarians, then given by Charlemagne to the Church.

RINDERPEST. See **CATTLE-PLAGUE**.

RINFORZA'NDO (Ital., strengthening), in Music, a direction to the performer indicating increased tone and emphasis.

RING (Sax. *ring* or *hring*, a circle or circular line), a circle of gold or other material. The practice of wearing rings has been widely prevalent in different countries, and at different periods. Rings have been used to decorate the legs, arms, feet, toes, neck, fingers, nose, and ears. The practice of wearing rings suspended from the nose, which is bored for that purpose, has been found among various savage tribes, more particularly the South-Sea islanders. Bracelets, necklaces, and ear-rings have been worn among nations both savage and civilized; but the most universal and most famous use of rings is on the finger. Finger-rings are alluded to in the Books of Genesis and Exodus; Herodotus mentions that the Babylonians wore them; and from Asia they were probably introduced into Greece. The rings worn in early times were not purely ornamental, but had their use as signet-rings. The Homeric poems make no mention of rings, except ear-rings; but in the later Greek legends, the ancient heroes are described as wearing finger-rings; and every freeman throughout Greece seems afterwards to have had one. The practice of counterfeiting signet-rings is alluded to as existing in Solon's time. The devices on the earlier rings were probably cut in the gold; but at a later period, the Greeks came to have rings set with precious stones, which by and by passed from articles of use into the category of ornament. Persons were no longer satisfied with one ring, but wore two or three—and their use was extended to women. The Lacedæmonians wore iron rings. The Romans are said to have derived the use of rings from the Sabines; their rings were at first, as those of the Greeks, signet-rings, but made of iron. Every free Roman had a right to wear one; and down to the close of the republic, the iron ring was worn by those who affected the simplicity of old times. Ambassadors, in the early age of the republic, wore gold rings as a part of their official dress—a custom afterwards extended to senators, chief magistrates, and in later times to the equites, who were said to enjoy the *jus annuli aurei*, from which other persons were excluded.

It became customary for the emperors to confer the *jus annuli aurei* on whom they pleased, and the privilege grew gradually more and more extensive, till Justinian embraced within it all citizens of the empire, whether *ingenui* or *libertini*. The signs engraved on rings were very various, including portraits of friends or ancestors, and subjects connected with mythology or religion; and in the art of engraving figures on gems, the ancients far surpassed artists of modern times. The later Romans, like the

Greeks, crowded their fingers with rings, and the more effeminate among them sometimes had a different ring for summer and winter. Rings entered into the groundwork of many oriental superstitions, as in the legend of Solomon's ring, which, among its other marvels, sealed up the refractory Jins in jars and cast them into the Red Sea. The Greeks mention various rings endowed with magic power, as that of Gyges, which rendered him invisible when its stone was turned inward; and the ring of Polykrates, which was flung into the sea to propitiate Nemesis, and found by its owner inside a fish; and there were persons who made a lucrative traffic of selling charmed rings, worn for the most part by the lower classes.

Fig. 1.

Various explanations have been given of the connection of the ring with marriage. It would rather appear that wedding-rings were worn by the Jews prior to Christian times. Fig. 1 shows a Jewish marriage ring beautifully wrought in gold filigree, and richly enamelled, now in the possession of Lord Londesborough. It has been said that as the delivery of the signet-ring to any one was a sign of confidence, so the delivery of a ring by the husband to the wife indicated that she was admitted into his confidence. Another explanation is, that the form of the ring symbolizes eternity and constancy; and it has been alleged that the left hand was chosen to denote the wife's subjection to her husband, and the third finger, because it thereby pressed a vein which was supposed to communicate directly with the heart.

The third finger has always been selected as the finger on which official rings are to be worn. Bishops on their consecration receive a ring to be worn on the third finger of the right hand, in order to indicate ecclesiastical authority, and doctors were formerly in use, for a similar reason, to wear a ring on the same finger. A ring has been much used at betrothal as well as marriage, and in many parts of the continent of Europe a wedding-ring is worn by the husband as well as the wife. In Britain, rings are occasionally worn on all the fingers except the first finger and thumb; the Germans usually wear a signet-ring on the first finger. During the 16th, 17th, and

Fig. 2.

18th centuries it was a very common practice to have mottoes inscribed on rings (fig. 2), including wedding-rings, and the motto was called the *posy* or *chanson*. The ring was the symbol of the dominion of Venice over the Adriatic; and yearly, on Ascension Day, a ring was thrown by the doge from the ship *Bucentaur* into the sea, to denote that as the wife is subject to her husband, so is the Adriatic Sea to the republic of Venice.

In pagan times in Europe, the ring seems to have been connected with fidelity or with espousals. Fig. 3 shows a form of

Fig. 3.

betrothal ring called a *gimmel*, or linked ring, which was used in later times; the upper fig. shows the three parts brought together; the lower fig., the parts separately. By an ancient Norse custom, described in the *Eyrbyggja Saga*, when an oath was imposed, he by whom it was pledged passed his hand through a silver ring, sacred to that ceremony; and in Iceland the ceremony of betrothal used to be accompanied by the bridegroom passing his four fingers and thumb through a large ring, and in this manner receiving the hand of the bride, as represented in a woodcut in an old edition of *Olavus Magnus*. As lately as 1780, the practice existed in Orkney of a man and woman plighting their faith at the Standing Stones of Stennis by joining their hands through the perforated stone of Odin.

Rings were greatly used in ancient Egypt. They were called *tebb*, finger-rings, and *khatem*, signets, both kinds being represented in the sculptures and mentioned in the hieroglyphs. Be-

sides these two classes, solid rings of gold and silver were used as money. Rings for the fingers are of the most remote antiquity, and were the emblems of rank and power. They were of two kinds; the solid ring, made of gold, silver, copper, or iron, having a square or oval bezel, on which the subject to be impressed was sunk or cut in intaglio. The oldest of these were of gold, iron not having been in use till the Roman rule over Egypt, or about the 1st c. A.D. A remarkably fine specimen is one of a Hemphite priest or flamen of the monarch Cheops, who lived in the time of the 26th dynasty, about the 5th c. B.C. But rings of this class are probably not so old as the other kind, which have a square or oblong plinth of gold, stone, or glass, on which the subjects are engraved also in intaglio. These plinths are pierced through their long axis to admit the metal ring on which they revolve, and are secured to it by wire coiled round the ring at the place of insertion. Scarabæi of glazed steatite, set in frames of gold or silver, were often used for bezels. The bezels have their base engraved with hieroglyphs and other subjects, the names of monarchs, figures of deities, mottoes, and devices. Such rings were used by functionaries; and in the account of the investiture of Joseph in the Book of Genesis, a ring was put on his finger as a symbol of his rank.

The poorer classes had rings of ivory or blue porcelain, with solid oval bezels, having in intaglio similar subjects. Rings appear to have been placed on all the fingers, and even the thumb, and the hands of ladies were loaded with these costly ornaments. A cat, emblem of the goddess Bast or Pasht, the Egyptian Diana, was a favorite subject of ladies' rings. The third finger of the left hand was the ring finger. Some remarkable instances of gold rings with revolving bezels have been found, as that of Thothmes III. in the collection of Lord Ashburnham, and another with the name of the monarch Horus, which contained gold to the value of £20. Such rings could give two impressions, like the seal and countersal of modern times.—Wilkinson, *Mann and Cust.*, vol. iii. pp. 370 and foll.; Bonomi, *Trans. R. Soc. Lit.*, New Series, vol. i. p. 108; Prisse, *Mon. Egypt.*, Pl. xlvii.; also *Antique Gems and Rings*, by King, 2 vols., 1872; *Finger Ring Lore*, by William Jones, F.S.A., 1876.

RINGBONES consist of a circle of bony matter round the horse's coronet, are most common in the fore limbs of draught horses with short upright pasterns, and much worked upon the hard roads; but they also occasionally appear on the hind limbs of lighter-bred horses. They seldom cause lameness, except when rapidly and recently formed; but as they are apt to stiffen the neighboring joints, they constitute unsoundness. Rest should be enjoined, and cold bran poultices or swabs, kept cool and moist by any refrigerant mixture, applied continuously until heat and tenderness are removed, when the fetlock is to be fired or dressed with fly-blister, or the ointment of the red iodide of mercury.

RING DOVE. See PIGEON.

RING MONEY. At an early stage of society, prior to the invention of coinage, but after the inconveniences of direct barter had been discovered, the precious metals, formed into rings, were used as a medium of exchange; these same rings being also serviceable in some cases as personal ornaments. The use of ring money among the Egyptians is proved by representations of gold and silver money in their paintings, an instance of which is to be seen in one of the grottoes in the Hill of Shek Aba at Quorneh, which bears the cartouche of Amunoph II. inscribed on its walls. The gold or silver rings were formed of a wire or bar of metal bent into a circle, but not quite united at the extremities, so that it could be easily made into a chain, from which portions could be detached at pleasure. It seems probable that the individual loops were not adjusted to a particular weight, but that each bundle of loops amounted in the aggregate to a particular weight. A metallic currency of this kind seems to be alluded to in the incident in the Book of Genesis, of the Hebrew patriarchs finding their money 'in full weight' at the mouth of their sacks. Ring money, both of gold and silver, similar to what is represented in the Egyptian paintings, was brought by Mr. Bonomi from Nubia. Some of the silver rings had been worn as bracelets, and were ornamented with engraved work. This kind of currency has probably never gone out of use in some parts of Africa since the remote period when it was employed in paying the exactions of the Pharaohs. Ring money for African traders is regularly manufactured at Birmingham of copper, or an alloy of copper and iron, and known under the name of 'Manillas.'

The ring money of the East found its way at an early period to Western Europe, including the British Islands. In Sweden and Norway its use seems to have continued down to the 12th c., or even later. A Norse law made about the year 1220, alludes to an established ring money, of which each ring was of a definite weight. The medieval ring money had so far advanced beyond the Egyptian as to have each ring adjusted to a special weight, for which it might pass without weighing. Cæsar mentions gold

and iron rings as used in Gaul and Britain for money; and gold and silver, and occasionally brass, ring money has been dug up in many parts of Britain, consisting of bars of metal bent in a circular shape; the ends in what seem to be the older specimens are left plain; in those of later times, they are flattened and ornamented. One example, found in one of the *Weems*, or subterranean dwellings of the island of Shapinshay in Orkney, is composed of three bars of gold twisted together like a cord. A remarkable silver chain of 93 rings, weighing above 93 ounces, was dug up in 1805 near Inverness, in the course of the excavations for the Caledonian Canal, and is now in the museum of the Scottish Antiquaries. Some of the larger specimens of gold ring money are very highly decorated. The gold torque worn round the neck of the Gallic warriors, weighing sometimes as much as four pounds, besides being a personal ornament, was adjusted to a certain weight as money.

Among the various modifications of ring money in use in different countries, may be mentioned the silver fish-hook money of Ceylon, mentioned by Tavernier, of the form of a flat wire bent into a hook, and issued as late as 1659. Specimens of it have lately been dug up.

RING OUZEL (*Turdus torquatus*, or *Merula torquata*), a species of thrush, rather larger than the blackbird, which it much resembles. It is a native of Europe, and chiefly of the western parts of it; spends the winter in the south of Europe or in Africa, and visits more northern regions in summer. It is of frequent occurrence in many parts of the British Islands. It is seldom seen in the more cultivated and thickly-peopled districts, but prefers mountain slopes, heathlands, and their vicinity. It makes its nest generally in heathy banks, often under a bush. The nest is of coarse grass, within which is a thin shell of clay, and an inner lining of fine dry grass. The R. O. is a constant visitor of gardens in the neighborhood of its haunts, committing great depreda-

Ring Ouzel (*Turdus torquatus*.)

tions, particularly when cherries are ripening. In Scotland it is known as the *Moor Blackbird*. It is of a bark-brown color, almost black; the feathers edged with blackish-gray, the feathers of the wings more conspicuously edged with gray; a crescent-shaped white collar on the throat. The song consists of a few loud, clear, and plaintive notes.

RINGWORM is a popular term for several distinct forms of skin-disease which occur in patches of a circular or annular form on the body, and especially on the scalp. Thus, a species of Lichen (q. v.), known to dermatologists as *Lichen circumscriptus*, in which the papules assume a circular arrangement, is commonly

Parasitic Fungus from the Root of the Hair in a case of True Ringworm, highly magnified.

(Copied from Aitken's *Science and Practice of Medicine*, 9d ed.)

A, isolated spores; B, spores united at their ends; C, C, empty tubes; D, sporular tubes.

regarded as ringworm; and the two species of Herpes (q. v.), known as *Herpes circinatus* and *H. Iris*, in which the vesicles oc-

cur in circular patches and in concentric rings, are usually included in the same term. None of these are, however, cases of true ringworm (*Tinea tonsdens*), which is a disease dependent on the presence of a special vegetable (fungous) parasite, now known to botanists as the *Trichophyton tonsurans*, or hair-plant, and discovered in 1845 by Maluisten. It consists of oval, transparent spores or globules, about $\frac{1}{100}$ th of an inch in diameter, for the most part isolated, but sometimes connected by articulated filaments. This fungus is seated in the interior of the hair-roots, and the hairs and the fungi simultaneously increase in size. The diseased hairs lose their elasticity and break, when they have risen a line or two above the scalp. In these cases the short stump of hair soon loses all its characteristics. If the hair breaks before emerging from the scalp, a little prominence is formed, consisting of fungus, epidermis, and sebaceous matter, and the assemblage of such little prominences gives the scalp the rough appearance known as goose-skin. This parasite exists, according to Dr. Aitken—whose *Science and Practice of Medicine* contains an excellent abstract of all that is known regarding parasitic diseases—in the *Herpes tonsurans* of Cazenave, which is the *Porrigio scutellata* of Willan, the *Tinea tonsurans* of Bazin, and the *Trichosia furfurans* of Erasmus Wilson and Dr. Wood. There are three varieties of true ringworm, which are described by Aitken under the following names: (1.) Ringworm of the Body (*Tinea circinata*); (2.) Ringworm of the Scalp (*Tinea tonsurans*); and (3.) Ringworm of the Beard (*Tinea sycosis*).

1. *Ringworm of the Body* first appears as a rose-colored and slightly-elevated spot about the size of a fourpenny-piece, on which a bran-like desquamation of epidermis soon begins, accompanied by slight itching. This spot gradually increases in size, but retains its circular form; and as it extends, the healing process commences at the center, so that the circular red patch is converted into a ring, enclosing a portion of healthy skin; and a ring thus formed may continue to increase till it reaches a diameter of four inches, or even more. It is apt to affect the face, the neck, the back, and the outside of the wrist. This form of ringworm frequently terminates spontaneously.

2. *Ringworm of the Scalp* usually occurs in children, and is especially prevalent when the nutrition is defective, or there is a scrofulous taint in the constitution. It appears in the form of round, scaly, irritable patches on different parts of the head; and the irritation often occasions the formation of minute vesicles. The hairs at these spots become dry and twisted, and are easily extracted; and when the disease advances, they break close to the scalp if an attempt is made to extract them. The stumps, and the epidermis surrounding them, become covered with a characteristic grayish-white powder, consisting of the spores of the fungus. The diseased parts are slightly elevated and puffy, and differ from the healthy scalp in color, being bluish or slate-colored in dark persons, and grayish-red or yellow in fair patients. The inflammation will last as long as the growth of the fungi continues; and even when they die spontaneously, as sometimes occurs, the affected spots remain permanently bald, in consequence of the hair-bulbs having become obliterated.

3. *Ringworm of the Beard* is chiefly met with on the chin, hairy part of the cheeks, and upper lips of men; but it occasionally attacks the axillæ and pubic region of women. It commences like ringworm of the body, but when the deeper structures become affected, pustular indurations, resembling Acne (q. v.), occur, and the hairs become readily detached. On examining the hairs under the microscope, it is seen that they are thickened; that their bulbs are partially disorganized; and that the medullary portion is atrophied.

The essential point in the treatment of all the varieties of true ringworm, is to apply to the roots of the hairs a preparation which will destroy the fungus; but before this can be done, the hair must be removed, if the disease has not already effected the removal sufficiently. This is best effected with small pincers about three inches long, and constructed so that the two extremities, which should be a couple of lines broad, shall come together very exactly. Or, in place of using the forceps, an ointment, composed of lime and carbonate of soda, of each 1 part, and 30 parts of lard, may be applied, which will soon remove the hair. French dermatologists recommend the application of 'l'Huile de Cade,' or 'oil of pitch,' obtained by the dry distillation of the wood of the *Juniperus oxycedrus*, to the part from which the hairs are to be removed, believing that it lessens the sensibility, and tends to loosen the attachment of the hair. In order to destroy and remove the plant, lint dipped in a solution of sulphurous acid should be continuously applied—sulphurous acid being probably the most energetic parasiticide at present known. Amongst the solutions that have been applied with the same object, may be mentioned that of corrosive sublimate, 1 part to 250 of water. The general health must be at the same time attended to, and the internal use of cod-liver oil may usually be advantageously combined with the local applications.

Ringworm in the lower animals, as in the human subject, con-

sists of the growth of a vegetable fungus on the surface of the skin, is common amongst young animals, is decidedly contagious, and communicable from man to the lower animals, and probably, also, from the lower animals to man. Commencing with a small itchy spot, usually about the head or neck, or root of the tail, it soon spreads, producing numbers of scurfy circular bald patches. It is unaccompanied by fever, and seldom interferes seriously with health. After washing with soap and water, run over the spots lightly every day with a pencil of nitrate of silver, or rub in a little of the red ointment of mercury, or some iodide of sulphur liniment.

RINNS OF GALLOWAY. See WIGTONSHIRE.

RIOBA'MBA, a town of Ecuador, 100 miles south from Quito, situated among the Andes, on an affluent of the Pastaza, a large branch of the Amazon. It is sometimes called New R., having been built instead of a former town of the same name, which was destroyed by an earthquake in 1797, and the ruins of which are 9 miles distant, at the foot of Chimborazo. Pop. about 16,000, in great part consisting of Indians.

RIO BRA'NCO, a river of Brazil, the largest affluent of the Rio Negro, rises near the sources of the Orinoco, in lat. about 3° N., long. about 64° W. It flows first east to long. 61° W., and then south-south-west to the Rio Negro, which it joins after a course estimated at 700 miles in length. At its junction with the Negro it is upwards of a mile in breadth, and its lower course resembles a string of lakes connected by narrow canals. Its navigation is much impeded by rapids and waterfalls.

RIO BRAVO DEL NORTE, or RIO GRANDE. See BRAVO DEL NORTE.

RIO DE JANEIRO, a maritime province in the south-east of Brazil, bounded on the S. and E. by the Atlantic. Area 26,530 sq. m.; pop. without the city (1872) 782,724. The coast on the north-east is low and lined with lagoons; but in the south the scenery of the shores is unusually beautiful. Mountain-ranges occupy the middle of the province, among which the peaks of the Organ Mountains, rising to from 6000 to 7000 feet, are conspicuous. Of the rivers the Parahiba is the chief. The soil is fertile, and the principal productions are sugar, coffee, cocoa, cotton, rice, and maize. The province is traversed by a railway. The capital is Praia Grande or Netherohy, which, including the district of St. Domingo, contains about 25,000 inhabitants. The largest and most important town, however, is Rio de Janeiro (q. v.).

RIO DE JANEIRO, generally called Rio, the capital of the Brazilian empire, and the largest and most important commercial emporium of South America, stands on a magnificent harbor, 75 miles west of Cape Frio, in lat. 22° 54' S. long. 43° 15' W. The harbor or bay of R., said, and apparently with justice, to be the most beautiful, secure, and spacious bay in the world, is land-locked, being entered from the south by a passage about a mile in width. It extends inland 17 miles, and has an extreme breadth of about 12 miles. Of its numerous islands, the largest, Governor's Island, is six miles long. The entrance of the bay, guarded on either side by granite mountains, is deep, and is so safe, that the harbor is made without the aid of pilots. On the left of the entrance rises the peak called, from its peculiar shape, Sugar-loaf Mountain; and all around the bay, the blue waters are girdled with mountains and lofty hills of every variety of picturesque and fantastic outline. The harbor is protected by a number of fortresses. The city stands on the west shore of the bay, about 4 miles from its mouth. Seven green and mound-like hills diversify its site; and the white-walled and vermillion-roofed houses cluster in the intervening valleys, and climb the eminences in long lines. From the central portion of the city, lines of houses extend four miles in three principal directions. The old town, nearest the bay, is laid out in squares; the streets cross at right angles, are narrow, and are paved and flagged; and the houses, often built of granite, are commonly two stories high. West of it is the elegantly built new town; and the two districts are separated by the Campo de Santa Anna, an immense square or park, on different parts of which stand an extensive garrison, the town-hall, the national museum, the palace of the senate, the foreign office, a large opera-house, &c. From a number of springs which arise on and around Mount Corcovado (3000 feet high, and situated 3½ miles south-south-west of the city), water is conveyed to R. by a splendid aqueduct, and supplies the fountains with which the numerous squares are furnished.

Great municipal improvements have within recent years been introduced; most of the streets are now as well paved as those of the finest European capitals; the city is abundantly lighted with gas; and commodious wharfs and quays are built along the water-edge. R. contains several excellent hospitals and infirmaries, asylums for foundlings and female orphans, and other charitable institutions, some richly endowed; about fifty chapels and churches, generally costly and imposing structures, with rich internal decorations; and several convents and nunneries. In the

College of Pedro II., founded in 1837, the various branches of a liberal education are efficiently taught by a staff of eight or nine professors; the Imperial Academy of Medicine, with a full corps of professors, is attended by upwards of 300 students; there is also a theological seminary. The national library contains 100,000 vols. The trade and commerce of R. is great, and is annually increasing. In the period 1870—80, the value of the total imports was about £9,500,000 per annum; the total value of exports varied from £9,000,000 to £10,500,000. In the year 1878—79, the value of coffee exported was £9,242,156; gold in bars and dust, £192,630; diamonds, £46,774; tobacco, £79,635; hides, £84,686. In 1875—76, the total shipments of coffee amounted to £8,891,138. The value of imports, consisting of silk, linen, cotton, and woollen goods, iron, &c., was £9,000,000 in 1877. In 1877, 3411 foreign vessels, of 1,657,452 tons, entered and cleared the port. Steam communication with other ports of Brazil is frequent; European steamships arrive and depart almost daily, and there is telegraphic connection with Europe. The capital and its environs are served by two railways, and eight different lines of tramway. Pop. (1872) 274,972.

The vicinity of R. was first settled by the French in 1555, but was occupied in 1567 by the Portuguese, who founded the present city, and gave to it the name of St. Sebastian. For the space of 140 years after its foundation, the city enjoyed a state of tranquil prosperity, and in 1763 it superseded Bahia as the seat of government, and became the residence of the viceroys of Portugal. On the proclamation of independence in 1822 (see BRAZIL), R. became the capital of the Brazilian empire.

RIO GRANDE, a name sometimes applied to the upper course of the river Parana (q. v.) in Brazil.

RIO GRANDE, a river of Senegambia (q. v.).

RIO GRANDE, or RIO GRANDE DEL NORTE. See BRAVO DEL NORTE.

RIO GRANDE DO NORTÉ, a small maritime province of Brazil, occupies the north-east angle of the country, and is bounded on the N. and E. by the Atlantic. Area, 22,000 sq. m.; pop. (1872) 233,979. It derives its name from a river, formerly called the Rio Grande, and now called the Potengi, which flows into the Atlantic at Natal; but the principal river is the Piranhas. The surface is flat along the shores, which are skirted by many dangerous shoals, but is hilly and mountainous in the interior. Salt is obtained in large quantity from a number of salt lakes, and building-stone is abundant. The soil, generally sterile, is fertile on the river-banks. The principal crop raised is cotton, and large herds of horses and cattle are reared on the pastures, which are extensive. About 35,000 bags of cotton were exported in 1881. The capital is Natal (q. v.).

RIO GRANDE DO SUL, or, to give the name in full, SAO PEDRO DO RIO GRANDE DO SUL, a maritime province of Brazil, constituting the extreme south portion of the empire of that name. It is bounded on the N. and W. by the river Uruguay, on the S.W. by the republic of Uruguay, and on the S.E. by the Atlantic. Area, 85,239 square miles; pop. (1872) about 455,000. The central districts are occupied by a range of mountains, which runs almost parallel to the Uruguay, and from which the land falls away into plains towards the Uruguay on the west, and the Atlantic on the east. Between the mountains and the flat coast regions are the large lakes Merim and Des Patos—the latter, 175 miles long and about 40 miles broad. Its salubrity of climate and fertility of soil admirably adapt it for European immigration. The great wealth of the province is in its flocks and herds, which are reared in great numbers on the *campinas* or prairies. It is stated that 500,000 cattle, whose hides and flesh are preserved, are slaughtered here annually, while as many more are driven northward for ordinary consumption. All the cereals and fruits of Central Europe can be grown here advantageously, and the inhabitants are awakening to the importance of developing the immense agricultural resources of the province. A considerable area is now covered with crops of maize, beans, wheat, and potatoes, and the agricultural products, which, till recently, were of little account, now form one-eighth of the whole exports. The gold-mines of the province have yielded in one year 6100 ounces, the value of which is stated at £25,000.

The principal articles of export of the province are beans, horns, hair, cattle and horse hides, grease and tallow, jerked or dried beef, tongues, mandioc flour, and maize. Of the most of these articles, the quantity exported has increased so rapidly as in a few years to be considerably more than doubled. Half of all the imports of the province consists of cotton, woollen, and linen manufactures, coals, earthenware, and hardware from Great Britain. The principal towns are Porto Alegre (q. v.) and Sao Pedro (or Rio Grande). The latter, a prosperous and increasing seaport at the south extremity of the Lake des Patos, and close to the sea (pop. 18,000), imported in 1882 goods to the value of £1,393,000. The chief articles of export were, beef valued at

£500,000; and hides, tallow, and hair, &c., £893,000. The shipping entered in 1881, consisted of 554 vessels of 133,777 tons; and cleared, 555 of 133,208 tons. The trade is conducted almost wholly by Englishmen and Germans.

RIOM, a small town of France, in the dep. of Puy-de-Dôme, is picturesquely situated on a hill, 1173 feet above the sea, 8 miles north-north-east of Clermont. It is built of dark lava, and is a perfect treasure of domestic architecture, especially of the Renaissance period. Linen, leather, and brandy are manufactured. Pop. (1876) 8733.

RI'O NE'GRO, one of the principal affluents of the Amazon, rises in an unexplored district of the south of the United States of Colombia (New Granada), flows in a general south-south-east direction, and joins the Amazon at Manaos, after a course estimated at 1000 miles in length. It receives from the north the Cassiquiare (q. v.), by means of which communication is established between the Orinoco and the Amazon; also the Cababuri, Padaviry, Branco, and other large streams; from the south comes its greatest affluent, the Vaupes. It is 1½ miles broad when it enters the Amazon.

RIO NEGRO, a river of South America, forms the greater part of the boundary between the Argentine Republic and Patagonia. At its source, it is called by the natives Melly-roumey-co—i. e., *four small rivers*—from the fact that it is formed by four head-waters from the bosom of the Cordilleras. It is afterwards called by the natives Courou-roumey-co, or Black River (Span. Rio Negro), from the dark color of its waters, caused by the depth and narrowness of its channel. It flows first north-east, then east and south-east through the plains to the Atlantic, into which it falls in lat. 41° 3' S., after a course of upwards of 700 miles. Shoals and islands obstruct its channel, and it is navigable only for 20 miles above its mouth.

RIONE'RO, a large town of Southern Italy, in the province of Potenza, 7 miles south of Melfi; pop. 12,051. It produces grain, maize, pulse, and wine. The inhabitants are agriculturists and shepherds. There is a great trade carried on in maple snuff-boxes, which are manufactured here.

RIOSE'CO, MEDINA DE, a small town of Spain, in the province of Valladolid, and 26 miles north-west of the city of that name, stands on two hills in a fertile district. In the middle ages, it was the center of considerable trade, but it has much declined in recent times. The chief church is that of Santa Maria, a beautiful Gothic edifice, richly decorated, and containing several excellent pictures. Here, in 1808, a Spanish army, 50,000 strong, under Blake and Cuesta, was defeated, with a loss of 6000 men, by 12,000 French troops, under Bessières. The chief result of this battle was that Joseph Bonaparte was placed on the throne of Madrid. After the defeat, the unresisting town was sacked with more than wonted barbarity. Pop. (1877) 4776.

RIOT is the legal name of an offence which consists in the assembling of three or more persons for an illegal purpose, or for the carrying out of a legal purpose in an illegal manner. Riots often commence in some supposed private wrong. Some degree of violence is incidental to a riot, and a degree of intimidation to the neighborhood. A riot cannot take place unless at least three persons act in concert. When a riot becomes formidable, it is usual for the authorities to take active measures to disperse it. Thus, any justice of the peace may command the persons assembled to disperse peaceably by a form of words called reading the Riot Act, which is as follows: 'Our Sovereign Lady the Queen chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in an Act of King George for preventing tumults and riotous assemblies—God save the Queen.' If the rioters, after this formal proclamation, remain more than one hour afterwards, they are guilty of felony, and may be seized, and carried before a justice. Sometimes it is difficult to distinguish between an illegal assembly and one which is legal, though noisy and tumultuous, and the opinion of the justice of the peace is not conclusive as to its illegality. Sometimes the Riot Act is read more than once during the disturbance, in which case the second or third reading does not supersede the first.

RIOUW' a Netherlands residency or government in the Eastern Archipelago, since Siak and dependences were taken from it, consists of the peninsula of Tandjong Pinang, the Lingga-Riouw Archipelago, a part of the coast of Sumatra, north of Djambi, and the adjoining kingdom of Indragiri; also the Tambilan, Anambis, and Natuna islands. Area about 3000 sq. miles. Pop. (1873) of the residency, 69,386, including 144 Europeans, 27,782 Chinese (25,678 being males), and 41,303 natives.

The islands of the archipelago are mountainous, the peak of Lingga rising to 3712 feet. Many of them are covered with heavy timber and a dense underwood, through which it is difficult to force a way. As far as is known, the prevailing rocks

are granitic and sandstone. Gold is found in Lingga, and tin was formerly extensively wrought; but the richer mines of Sinkep and the Carimon islands, in the southern entrance of the Strait of Malacca, now yield the largest amount of that ore. Coal is also found in the Riouw-Lingga islands.

The climate is not considered unhealthy though at times the heat is intolerable. The chief products are sago, pepper, damar resin, gambir, gutta-percha, ratans, cotton, fruits, and many varieties of fine timber. Edible nests are found in abundance, and the waters swarm with fish. Agar-agar, tripang or bêche-de-mer, and shell-fish are largely collected. The native Malays chiefly gain a living by fishing, and the Chinese have extensive *Uncaria gambir* and pepper gardens. Imports (1872), £372,422; exports, £369,213.

The industries are manufacturing gambir, distilling arrack, weaving silks, shipbuilding, wood-cutting, tile and brick making, together with extensive fisheries. The original inhabitants are Malays; who are more numerous in Lingga than the other islands. The strangers are Europeans in the pay of the Netherlands colonial government, Chinese, Buginese, and Javans. The town is at the north-west end of Tandjong Pinang, 54° 4' N. lat., and 104° 26' 30" E. long., in a beautiful bay where there is safe anchorage. Pop. 8609.—See *Journal of the Ind. Archip.* vol. i.; Crawford's *Descriptive Dict.*; *De Residentie Riouw*, door J. J. de Hollander; and Colonial Reports of 1875—1876.

RI'PON, a market-town, and municipal and parliamentary borough, in the West Riding of Yorkshire, 23 miles north-west of York. The market-place, to which the four principal streets lead, is spacious, surrounded by good houses and shops, and has in its center an obelisk 90 feet high. R. is a bishop's see. The cathedral, founded 1109—1114 is cruciform, is surmounted with two uniform towers, 110 feet high at the west end, and also by a center tower. It is esteemed one of the best proportioned churches in the kingdom. Trinity Church, built in 1826, is a fine cruciform edifice in Early English. There are other places of worship, two hospitals, and a number of important schools. The principal branches of industry are machine-making, tanning, and malting. About two miles from R. are the famous ruins of Fountains Abbey, adjoining the grounds of Studley Royal, seat of the Marquis of Ripon. Pop. (1871) 6806; (1881) 7390.

RIPPLE-MARK. Undulations similar to those observed on sandy shores, and produced by the particles of sand being drifted along by the water, have been observed on the surface of sandstones of all ages. They may be held generally as indicating that the deposition of the bed on which they occur took place on a sea-bench, or under water not more than ten feet deep. Recent ripple-marks have, however, been observed at a depth of 60 feet, and there is reason to believe that mud and sand may be disturbed at much greater depths by currents of water. Loose sand also may be driven by the wind into ripple-waves, that cannot be distinguished from those produced by the receding tide.

RI'SHI (from the obsolete Sanscrit *r'ish*, see, kindred with *dr's'-*, *δερκ-*) is the title given to the inspired poets of the Vedic hymns, as they were supposed to have 'seen,' or, in other words, received, the Vedic hymns from the deity through the sense of sight. 'The R'ishis,' Yaska (q. v.) says, 'see the hymns with all kinds of intentions.' They were therefore the oldest poets of India, and the word R'ishi itself becomes thus even identified with Vedic poetry. At a later period, however, the title R'ishi was given to renowned authors, though they were not considered as inspired by a deity, as, for instance, to the authors of the Vedic Kalpa, works which, by all Hindu writers, are admitted to be of human authorship.—Compare Goldstücker, *Pān'ini*, &c., p. 64, ff.

RISING, in Heraldry, a term applied to a bird when represented opening his wings as if about to take flight.

RISING IN THE AIR. The name of a belief (prevalent in the middle ages) that the bodies of holy persons were sometimes lifted up and suspended in the air during the continuance of a religious ecstasy. Calmet states in his work on Apparitions that this singular phenomenon might be produced by the fervor of the Holy Spirit; by the ministry of good angels; or by a miraculous favor of God, who desired thus to do honor to his servants in the eyes of men. Numerous instances are recorded in the *Acta Sanctorum*. St. Philip of Neri, in his religious ecstasies, was elevated in the air, sometimes to the height of several yards, almost to the ceiling of his room, and this quite involuntarily. He tried in vain to hide it from the knowledge of those present, for fear of attracting their admiration. St. Ignatius de Loyola was sometimes raised up from the ground to the height of two-feet, while his body shone like light. St. Robert de Palentin rose also from the ground sometimes to the height of a foot and a half, to the great astonishment of his disciples and assistants. In the life of St. Dunstan it is stated that, a little time before his death, as he was going up stairs to his apartment, accompanied by several persons, he was observed to rise from the ground; and as all

present were astonished at the circumstance, he took occasion to speak of his approaching death. In a recent biography of Girolamo Savonarola, it is also stated that while that martyr was in prison, shortly before his execution, he was observed once, while in prayer, raised from the ground, and was seen distinctly suspended in the air for some short period.

These relations account for the frequency with which representations of saints are exhibited in an aerial position in medieval paintings and works of art. This belief falls in with one of the alleged phenomena of modern spiritualism (q. v.).

RISK, in point of law, is used chiefly in reference to the sale of goods, and injury or loss to the goods before delivery. On such occasions, the question, in English law, is governed by the previous question, whether the property has passed or not by the sale. If it has, then whoever is the owner must bear the loss of the goods. In Scotland, the risk is with the buyer of goods, whether the right of property has passed or not. See **CARRIER**.

RISO'TTO, an elegant Italian dish, consisting chiefly of rice. Onions are shredded into a frying-pan with plenty of butter, and they are fried together until the onions become very brown, and communicate their color to the butter. The butter is then run off, and to this is added some rich broth, slightly colored with saffron, and the whole is thickened with well-boiled rice, and served up instead of soup, at the commencement of a dinner.

RISSOLE, a culinary preparation used as an *entrée*. It consists of meat or fish of any kind finely minced and made into small forms, which are then coated with a very thin crust either of pastry or of bread-crumbs mixed with yolk of egg, and fried. There is great variety in this dish.

RISTORI, ADELAIDE, a celebrated Italian tragic actress, was born in 1821 at Cividade in Frioul. Her parents were strolling players, and she almost began life in the theater. At the age of 14, she played in *Francesca da Rimini*, and in a few years became the leading Italian actress. Her talents, her beauty, and her grace made her a universal favorite. In 1847, her marriage with the Marquis Capranica del Grillo (who died in 1861) temporarily interrupted her dramatic career; but after two years, she returned to the stage, and appeared at Rome in 1849 in Alfieri's tragedy of *Myrrha*. But the French attack on the city caused her to desert the theater for the hospital, where she employed herself assiduously in nursing the wounded. After having acted in 1850 and succeeding years at Rome and Turin in various characters of Alfieri with immense applause, she presented herself before a French audience in 1855, when Rachel was in the height of her fame, a proceeding considered in the light of a challenge by the first Italian actress to the first French actress. Even at Paris she obtained a triumph, her genius creating an enthusiasm which could not be repressed. Without all the sympathetic sensibility of Madame Rachel, she surpassed her in vivacity and expression. She has since appeared with success in England, the United States, &c.

RITE (Lat. *ritus*) is in general an external sign or action employed in religious use, and designed either to express or to excite a corresponding internal religious feeling. Such are, for instance, the uplifting or outstretching the hands in prayer, the imposition of hands in blessing, &c. The ancient Jewish religion abounded with rites and ceremonies, and through their excessive multiplication in the religions of the Gentiles, religion degenerated almost entirely into outward form. A marked distinction in this respect is drawn by our Lord (John iv. 23) between the old and the new law, which one class of Christians have interpreted as a condemnation of all external ceremonial, while even those who contend for the retention of ceremonies in Christian worship, require that their use should always be accompanied and elevated by the corresponding internal spirit. The great ground of difference in the Puritan controversy in England and the corresponding disputes in continental churches, was the lawfulness of ceremonies. See **GENUFLÉXION**, **PURITAN**.

The name rite is sometimes used to signify the aggregate of all the ceremonies used in a particular religious office, as the 'rite' of baptism or of the Eucharist. In a still wider sense, it is used of the whole body of distinctive ceremonial, including the liturgy employed by a particular community of Christians. In this way we speak of the 'Roman rite,' the 'Greek rite,' the 'Syrian rite,' the 'Armenian rite,' the 'Coptic' or the 'Slavonic rite.'

RITENU'TO (Ital. kept back), a term in music implying that the speed of the movement is to be diminished.

RITORNE'LLO (Ital. return), in Music, in its original sense, a short repetition like that of an echo, or a repetition of the closing part of a song by one or more instruments. The same term has, by later usage, been applied to all symphonies played before the voices begin which prelude or introduce a song, as well as the symphonies between the members or periods of a song.

RITSCHL, FRIEDR. WILH., one of the first (perhaps the very first) classical philologists of modern times, was born at Gross-

vargula in Thuringia, 6th April 1806. He studied at Leipzig under Hermann, and from 1826 to 1829 at Halle, where he eagerly availed himself of the lectures and society of Reissig. In 1832, he was called to Breslau as extraordinary professor, receiving at the same time a joint-directorship of the philological seminary there. Two years afterwards, he became ordinary professor, and spent the winter and spring of 1836—1837 on a learned tour through Italy. In 1839, he accepted an invitation to Bonn as professor of classical literature and rhetoric. The Prussian government conferred on him the rank of privy-councillor in 1856. His first literary works were devoted to the Greek grammarians, as the edition of Thomas Magister (Halle, 1832), the acute and penetrating treatise, *De Oro et Orione* (Bresl. 1834), and the richly elucidatory *Die Alexandrin. Bibliotheken und die Sammlung der Homerischen Gedichte durch Pisistratus* (Bresl. 1838), sufficiently prove; but by far his greatest work is his edition of Plautus (Bonn, 1848—1858), executed with the richest critical apparatus. It was accompanied by a comprehensive *prolegomena* on the Plautinian metres. The work secured for him a splendid reputation among his countrymen.

Among the numerous productions of R. which may be regarded as preparatory to this *chef-d'œuvre*, the most important is his *Parrer-ga Plautina et Terentiana* (Leip. 1845). Subsequently his literary activity took another direction—viz., a systematic treatment of Latin inscriptions, with the view of illustrating the history of the Latin language. His labors in this department have been crowned with success, for R. has thrown more light upon the successive phases of the language than any other single individual. To this field belong his *Lex Rubria* (Bonn. 1851), *Tibulus Mummianus* (Berl. 1852), *Monumenta Epigraphica Tria* (Berl. 1852), *Inscriptio Columnæ Rostratæ* (Berl. 1852), *Anthologia Latina Corollarium* (Berl. 1853), *De Sepulcro Furiorum* (Berl. 1853), *De Pictilius Litteratis*, &c., (Berl. 1853), *Poesis Saturnina Spicilegium* (Bonn, 1854), *De Titulo Metrico Lambacensi* (1855), *De Varronis Hebdomadum Libris* (1856), *In Leges Viselliam, Antoniam, Corneliam Observationes Epigraphica* (1860), and *Proemiorum Bononiensium Decas* (1862). Besides these works, R. contributed a large number of learned dissertations to the programmes of the university of Bonn, in the *Transactions of the Archæological Institute of Rome*, and in the *Rheinisches Museum für Philologie*. On the twenty-fifth anniversary of his appointment to Bonn, there began to be published *Symbola Philologorum Bononiensium in Honorem Frid. Ritscheli* (1864—1867). In 1867, R., 30 of whose pupils were then professors in German universities, was appointed foreign associate of the French Academy of Inscriptions and Belles Lettres. He died in 1876.

RITTER, HEINRICH, German philosopher, was born at Zerbst in 1791, studied theology at Halle, Göttingen, and Berlin, from 1811 to 1815, and in 1824 was created Professor Extraordinarius at Berlin University. In 1835, he accepted a call to the university at Kiel, and went thence in 1837 to Göttingen. R. owes his literary fame especially to his profound works on the history of philosophy. The principal are: *Ueber die Bildung des Philosophen durch die Geschichte der Philosophie* (On the Education of the Philosopher through the History of Philosophy), 1817; *Welchen Einfluss hat die Philosophie des Cartesius auf die Ausbildung der des Spinoza gehabt?* (What Influence has the Philosophy of Descartes exercised on that of Spinoza?) Leip. and Altenb. 1817; *Ueber die Philos. Lehre des Empedokles* (On the Philosophical Doctrine of Empedocles), 1820, in Wolf's *Literary Analecta*; *Geschichte der Ionisch. Phil.* (History of the Ionian Philosophy), Berl. 1821; *Geschichte der Pythagorisch. Phil.* (History of the Pythagorean Philosophy), Hamb. 1826; *Bemerkungen üb. die Phil. d. Megarisch. Schule* (Remarks on the Philosophy of the Megaric School), Rheinisches Museum, 2d series; *Gesch. der Phil.* (History of Philosophy), vol. i.—xii. Hamb. 1829—1835; 2d ed., vol. i.—iv., 1836—38; *Vorlesungen zur Einleitung in die Logik* (Introductory Lectures to Logic), Berl. 1823; *Abriß der Philosophie. Logik*, Berl. 1824; *Die Halb-Kantianer und der Pantheismus* (The Half-Kantians and Pantheism), Berl. 1827; *Ueber das Verhältniss der Philosophie zum wissenschaftlichen Leben überhaupt* (On the Relation between Philosophy and Scientific Life in General), Berl. 1835; *Ueber die Erkenntniss Gottes in der Welt* (The Recognition of God in the World), Hamb. 1836; *Ueber das Böse*, (On Evil), Kiel, 1839; *Philosophical Essays* (Kiel, 1839—1840); *System der Logik und der Metaphysik* (Gött. 1856); *Die Christliche Philosophie* (2 vols. Gött. 1858—1859); *Encyclopädie der Philosophischen Wissenschaften* (vols. 1 and 2, Gött. 1862—1863). R. was not a partisan of any philosophical school, but a critic of all. He died in 1869.

RITTER, KARL, an illustrious geographer, was born August 7, 1779, in Quedlinburg, in Prussia, studied in Halle, was nominated in 1820 Professor Extraordinarius of Geography at Berlin University, became subsequently member of the Academy, and Director of Studies of the Military School. He died 28th September 1859. With R., as the founder of general comparative

geography, begins a new epoch in the history of geographical science. His chief works are: *Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen* (Geography in its Relation to Nature and the History of Men), 17 vols. Berl. 1822–1854.—The work is divided into 4 parts, 1. Introduction and East Asia, in 5 vols., containing Middle Asia, High Asia, Siberia, China, and India, vol. ii.—vi.; 2. West Asia, in 5 vols. (vols. vii.—xi.); 3. Arabia (vol. xii.—xiii.); 4. The Sinai Peninsula, Palestine, Syria (vol. xiv.—xvii.), with four indexes, and an Atlas of Asia. Introduction to an Essay on a more Scientific Treatment of Geography (Berl. 1852); *Europa, ein geographisch-, historisch-, statistisches Gemälde* (Europe, a Geographical, Historical, Statistical, Picture), 2 vols. Frankf. 1807; *Die Stupas, oder die architect. Monumente, &c.* (The Stupas, or the Architectural Monuments on the Indo-Bractrian Royal Road, and the Colossus of Bamiyan), (Berl. 1838). Many of his antiquarian and historico-antiquarian researches are contained in the *Monatsberichten der Berlin Geographischen Society*, and in the *Zeitschrift für allgemeine Erdkunde, &c.* Other noteworthy productions are: *Die Colonisirung von Neu Zealand* (Berl. 1842); *Blick auf das Nilquellend* (Berl. 1844); *Der Jordan und die Beschäftigung des Todten Meeres* (Berl. 1850); *Ein Blick auf Palestina und die Christliche Bevölkerung* (Berl. 1852).

RITUAL (Lat. *rituale*, a book-[or collection] of rites), the name of one of the service-books of the Roman Church, in which are contained the prayers and order of ceremonial employed in the administration of certain of the sacraments and other offices of the church. The ceremonial of the offices of the Roman Church administered by bishops is contained in the books entitled *Pontificale* and *Ceremoniale Episcoporum*. The priestly offices are detailed in the *Ritual*. In its present form it dates from the Council of Trent, which directed a revision of all the different rituals then in existence, which were numerous, and exhibited considerable variety of detail. Paul V., in 1614, published an authoritative edition, which has frequently been reprinted, and of which a further revision was issued by Benedict XIV. Besides the Roman Ritual, there are many diocesan rituals, some of which are of much historical interest. In the Greek Church, as in the other eastern communions, the Ritual forms part of the general collection (which contains also the Eucharistic service) entitled *Euchologion*. In the Anglican Church, also, the *Book of Common Prayer* may be said to contain the Ritual. The most approved commentary on the Roman Ritual is that of Barrufaldo (2 vols., Florence, 1847).

RITUALISM, the name popularly but inaccurately given to the remarkable increase of ceremonial in the Church of England since the year 1863. It may be considered as a development of Tractarianism, though it is one not contemplated by the authors of that movement, whose aim was rather to disseminate doctrines than to introduce ritual changes. Its collateral causes may be said to be: (1) The great advance of æsthetic taste, and the increased cultivation of the fine arts in the service of religion. (2) The extended study by the clergy of ancient liturgies, and the connection discovered to exist between them and the offices of the English Church. With the spread of High Church principles, certain changes in the mode of conducting divine service had been introduced by the clergy, which, though unpopular at first, were widely adopted, and up to a certain point, had received the sanction of the law. But the restored church with low and open benches—the separated chancel—the altar-table with coverings of different color according to the ecclesiastical seasons, and candlesticks, and a cross upon or over it—choral services, and weekly celebration of the communion, were all that had hitherto been attempted. To these comparatively small alterations, important additions have recently been made—viz. (1) Special vestments at the celebration of the holy communion, and at certain other times, viz., for the celebrant, an alb and stoles, of different color, and chasuble; for the assisting ministers, albs with tunics, according to the seasons. At other times, a cope is worn instead of a chasuble. (2) Lighted candles on the altar at holy communion. (3) Incense burned either in a ‘thurible’ or in a standing vessel. (4) The mixing of water with wine for the communion. (5) The use of wafer-bread. (6) Elevation of the elements either during or after consecration. (7) The attendance of non-communicants at the holy communion. (8) Processions with crosses, banners, and vested attendants.

These innovations are defended by their promoters on the following grounds of (a) Law, (b) Doctrine, and (c) Expediency.

(a) The rubric at the end of the calendar in the Book of Common Prayer enacts ‘that such ornaments of the church and of the ministers thereof at all times of their ministration shall be retained and be in use as were in this Church of England by the authority of parliament in the second year of the reign of King Edward VI.’ The Judicial Committee of the Privy Council in the case of Westerton v. Liddell (1857), ruled that ‘ornaments’ here means, ‘all articles used in divine service;’ that the words, ‘by authority of parliament,’ &c., refer to the first Prayer-book

put forth in that reign (1549); and that ‘the meaning of the rubric, as of the previous statute of Elizabeth, the language of which it adopts, is, that the same dresses, utensils, and articles which were used under the first Prayer-book of Edward VI. may still be used.’ Now, the first Prayer-book of Edward VI. prescribes that at the time of the communion ‘the priest that shall execute the holy ministry shall put on him a white alb plain with a vestment, i. e., a chasuble, or cope;’ and the assistants ‘likewise the vestures appointed for their ministry, that is to say, albs with tunics.’ It is therefore inferred that the above are the only legal vestments in which the holy communion should be celebrated. To this it is objected (1) That the word ‘retained’ can only refer to such vestures as were in use up to the time of the last publication of the rubric—viz., the surplice in parish churches, and copes in cathedrals. (2) That the rubric, when first inserted under Elizabeth, was limited by the Injunctions and Advertisements of that reign, which aimed only at the restoration of the surplice.

(3) That whatever be the intention of the rubric, it has been so long obsolete that it is absurd to revive it. It is answered (1) That the word ‘retained’ must have the same meaning that it had in the rubric of Elizabeth, in which it first occurs. (2) That the Injunctions and Advertisements were not of supreme authority, and were only intended to help towards restoring a decent uniformity in divine worship. (3) That the fact that a law has become obsolete does not invalidate its force. The same reference of the ornaments rubric to the second year of Edward VI. is held to authorize other accessories known to have been in use at that time, though not specified in the first Prayer-book—such as lighted candles, incense, &c. And on the principle, that the Reformed Church was legally identical with that before the Reformation—which the 30th canon of 1603 is cited as maintaining—it is further contended that all ancient laws and usages are still in force, except where directly or implicitly abrogated by subsequent enactment. And as the chief ritual authority before the Reformation was the liturgy of Sarum (the Sarum ‘use’ referred to in the preface to the present Prayer-book), it is to that standard, as far as possible, that the more advanced Ritualists desire to conform.

(b) The doctrinal grounds of defence are expressed in the following statements: (1) The Eucharist (as the Lord’s Supper was anciently called) is the special institution of Christ, the single rite of continual observance which He enjoined on His disciples, and the chief act of Christian worship. It is therefore right to exalt and dignify it above all other services, and mark it as standing on different and higher ground than any other institution. (2) The Eucharist, according to the universal belief of the ancient church, is to be regarded as a sacrifice, *commemorative*, as the Jewish sacrifices were *anticipatory*, of the death of Christ—not as iterating or repeating it (which idea alone the 31st article is held to condemn), but as a solemn pleading and offering of it before God, as Christ himself offers it in heaven. Hence the position of the celebrant in front of the altar, and the use of a sacrificial vestment, as the chasuble is held to be. (3) In the Eucharist, there is a real presence of Christ, which, though spiritual, is *objective*, i. e., not dependent on the receiver, but as a result of consecration, and to a certain extent *local*. (The growth of this belief is marked by the change made in a recent edition of Keble’s *Christian Year* of the words, ‘not in the hands,’ in a poem on the Eucharist, to, ‘as in the hands.’) Hence distinct acts of adoration, addressed, not, as is explained, to the elements, but to the Divine Presence, of which they are the vehicles and signs.

(c) On the ground of *expediency* also, it is contended: (1) That experience proves that the only way of attracting and gaining a hold on the vast uneducated masses of our towns and cities is by a worship addressed not merely to the ear, but to the eye. ‘Ritualism,’ says one of its defenders, ‘is the *object-lesson* of Religion.’ Services conducted in grand and beautiful buildings—brilliantly lighted—with splendid vestments, touching music, costly decorations, and every outward token of reverence and solemnity, will impress the young and the poor as nothing else can do. Those churches in London where advanced ritual prevails are said to be thronged with worshippers—mainly of the lower classes, and in great proportion of men—when others are almost empty. (2) A further argument, under this head, is connected with the desire, which has grown up of late years among the High Church party, for the restoration of the visible unity of Christendom, and specially the renewal of communion between the Church of England and both the Eastern and the rest of the Western Church; and with this view, it has become an avowed object to assimilate the Anglican service as much as possible to that of other Catholic churches.

It remains to notice briefly the effect of these innovations. It is a remarkable index of the change of popular feeling within the last twenty years, that such bold and startling changes, altering the whole character of the Anglican service, should, by a large number of people be not only tolerated, but approved. In 1869,

the attempt of the rector of St. George's-in-the-East to introduce Eucharistic vestments, led to riots which convulsed the whole of East London. In the year 1867, in about twelve churches of the metropolis—and in several country towns and villages—a far more advanced ritual, with vestments, altar-lights, and other ceremonies, regularly attracted an eager throng, not of spectators only, but of worshippers. And the spread of the movement may be judged by the statement, which appears authorized by facts, that within a few months after the first Report of the Royal Commissioners on Ritual, the vestments were introduced in more than thirty churches. On the other hand, among the 'Protestant' members of the church, and those of other denominations, the movement has provoked the loudest opposition.

Most of the bishops have, directly or indirectly, expressed their disapprobation; the press, except two or three journals, which are its strenuous advocates, is almost unanimous in denouncing it; the more moderate members of the High Church party discourage it; and active efforts have been made to arrest it by legislative interference. In the Lower House of Convocation, on the motion of the Dean of Ely, a committee was appointed to consider the subject, which, after careful examination, reported, in June 1866, that vestments and altar-lights, whether legal or not, should not be introduced without the sanction of the bishop; that the censuring of persons and things, elevation after consecration, wafer-bread, and presence of non-communicants (except in special cases), were to be discouraged. In deference to this opinion, the censuring of persons and things has been in some churches given up. Suits were instituted against several individuals—the Rev. A. H. Mackonochie, incumbent of St. Albans, London; the Rev. T. B. Simpson, in the diocese of Essex, and others. The points complained of in these are chiefly elevation and the mixed chalice. In the beginning of the year 1866, an opinion was obtained, at the instance of some of the bishops, from five eminent counsel, among whom were Sir R. Palmer and Sir Hugh (now Lord, Cairns, against the legality of all ritualistic innovation (the main grounds of which opinion are given in the *objections* above stated). In reply to this, another opinion was obtained, by the Council of the English Church Union, from nine leading counsel—some of whom have since been raised to the bench—all of whom advise in favor of the legality of vestments, all but two in favor of altar-lights, and all against incense; on the mixed chalice and wafer-bread, they are nearly equally divided.

In the session of 1867, the Earl of Shaftesbury introduced a bill—founded on the 58th canon of 1603—to limit ecclesiastical vestments to the ordinary surplice and hood, in favor of which more than 600 petitions were presented; while one against it, presented by Lord Redesdale, was signed by more than 9000 clergy and lay communicants. (An earlier memorial, to the Archbishop of Canterbury, against any change in the existing law, was signed by more than 40,000 communicant members of the church.) This bill was withdrawn on the appointment by the government of a Commission 'to inquire into the Rubrics, Orders, and Directions for regulating the course and conduct of Public Worship, &c., according to the use of the United Church of England and Ireland.' The commissioners included the Archbishops of Canterbury and Armagh, and the Bishops of London, St. Davids, Oxford, and Gloucester. They published a report to the effect that 'it is expedient to restrain, in the public services of the church, all variations in respect of vesture from that which has long been the established usage of the said church; and that this may be best secured by providing aggrieved parishioners with an easy and effectual process for complaint and redress.' The evidence appended to the report supplies much information as to the various practices prevailing, and the widely different views entertained. The general conclusions appear to be that vestments, and probably altar-lights and the mixed chalice, are legal; that an ornate ritual is useful among some classes, and might, with certain safeguards, be allowed; that absolute uniformity is impossible, but that the law might be obeyed a good deal more generally than it is; that the maintenance of the present law, with a wide and liberal interpretation, but limited as a maximum to the ritual of the 2d year of Edward VI., with some recognized ecclesiastical authority to restrain unauthorized variations, would be most for the welfare of the church. The report produced no restraint on the progress of Ritualism, and in May 1873, 60,000 persons of standing and influence presented an address to the two archbishops requesting them to adopt means for checking the growth of ritualistic practices.

In April, 1874, a bill for this purpose was introduced in the House of Lords by the Archbishop of Canterbury, entitled The Public Worship Regulation Act. It was adopted by the government, but was opposed in the House of Commons by Mr. Gladstone in a series of six resolutions, and notwithstanding a considerable amount of ecclesiastical agitation, it became law in August. Its main provision is the appointment of a judge for the trial of ritualistic cases. A complaint against the use of vestments, ornaments, and rites and ceremonies, or the omission of

such as are ordained in the Book of Common Prayer, in the churches or burial-grounds of the Church of England, may be presented to the bishop of the diocese by an archdeacon or churchwarden, or by three parishioners, members of the church, of full age, and a year's residence in the parish. In the event of the parties not submitting to the directions of the bishop, he shall forward the case for trial by the judge, from whose decision an appeal lies to the Privy Council.

RIVE-DE-GIER, a flourishing manufacturing town of France, in the dep. of Loire, stands on the Gier, in the middle of the best coal-field in France, 13 miles north-east of St. Etienne by railway. There is water-communication with the Rhone by means of the Canal-de-Givors, which extends from this town to Givors, on the Rhone. South of the town is the immense and well-built basin of Couson, containing 1,500,000 cubic *mètres* of water for the supply of the canal. It was formerly a mere stronghold, surrounded by high walls, and defended by a strong castle; and in 1815, the number of its inhabitants was under 4000. In 1876, it contained 14,518 inhabitants. Around the town, there are about 50 coal-mines in operation; and the principal manufacturing establishments are silk-mills, important glass-works, factories for steam-engines, and other machinery, steel factories and foundries.

RIVER. Rivers are the result of the natural tendency of water, as of all other bodies, to obey the law of gravitation by moving downwards to the lowest position it can reach. The supply of water for the formation of rivers, though apparently derived from various sources, as from rain-clouds, springs, lakes, or from the melting of snow, is really due only to atmospheric precipitation; for Springs (q. v.) are merely collections of rain-water; lakes are collections of rain or spring water in natural hollows, and snow is merely rain in a state of congelation. The rills issuing from springs and from surface-drainage unite during their downward course with other streams, forming *rivulets*; these, after a further course, unite to form *rivers*, which, receiving fresh accessions in their course from *tributaries* (subordinate rivers or rivulets) and their *feeders* (the tributaries of tributaries), sweep onwards through ravines, and over precipices, or crawl with almost imperceptible motion across wide, flat plains, till they reach their lowest level in ocean, sea, or lake. The path of a river is called its *course*; the hollow channel along which it flows, its *bed*; and the tract of country from which it and its subordinates draw their supplies of water, its *basin*, or *drainage-area*. The basin of a river is bounded by an elevated ridge, part of which is generally mountainous, the crest forming the water-shed; and the size of the basin, and the altitude of its water-shed, determine, *ceteris paribus*, the volume of the river. See **RAIN**. The greater or less degree of uniformity in the volume of a river in the course of a year, is one of its chief physical features, and depends very much on the mode in which its supply of water is obtained.

In temperate regions, where the mountains do not reach the limit of perpetual snow, the rivers depend for their increase wholly on the rains, which, occurring frequently, and at no fixed periods, and discharging only comparatively small quantities of water at a time, preserve a moderate degree of uniformity in the volume of the rivers—a uniformity which is aided by the circumstance, that in these zones, only about one-third of the rainfall finds its way directly over the surface to the rivers; the remaining two-thirds sinking into the ground, and finding its way to spring-reservoirs, or gradually oozing through at a lower level in little rills which continue to flow till the saturated soil becomes drained of its surplus moisture, a process which continues for weeks, and helps greatly to maintain the volume of the river till the next rainfall. This process, it is evident, is only possible where the temperature is mild, the climate moist, evaporation small, and the soil sufficiently porous; and under these circumstances, great fluctuations can only occur from long-continued and excessive rains or droughts. In the hotter tracts of the temperate zones, where little rain falls in summer, we occasionally find small rivers and mountain torrents becoming completely exhausted; such is often the case in Spain, Italy, Greece, and with the Orange, one of the largest rivers of South Africa.

In tropical and semi-tropical countries, on the other hand, the year is divisible into one dry and one wet season (see **RAIN**); and in consequence, the rivers have also a periodicity of rise and fall, the former taking place first near the source, and, on account of the great length of course of some of the tropical rivers, and the excessive evaporation to which they are subjected (which has necessarily most effect where the current is slow), not making itself felt in the lower part of their course till a considerable time afterwards. Thus, the rise of the Nile occurs in Abyssinia in April, and is not observed at Cairo till about midsummer. The fluctuations of this river were a subject of perpetual wonderment to the ancient civilized world, and were of course attributed to superhuman agency; but modern travel and investigation have not only laid bare the reason of this phenomenon, but discovered

other instances of it, before which this one shrinks into insignificance.

The maximum rise of the Nile, which is about 40 feet, floods 2100 sq. m. of ground; while that of the Orinoco, in Guiana, which is from 30 to 36 feet, lays 45,000 sq. m. of savannah under water; the Brahmaputra at flood covers the whole of Upper Assam to a depth of 10 feet, and the mighty Amazon converts a great portion of its 500,000 sq. m. of silvas into one extensive lake. But the fluctuations in the rise of the flood-waters are surpassed by some of the comparatively small rivers of Australia, one of which, the Hawkesbury, has been known to rise 100 feet above its usual level. This, however, is owing to the river-beds being hemmed in by lofty abrupt cliffs, which resist the free passage of a swollen stream.

The increase from the melting of snow in summer most frequently occurs during the rainy season, so that it is somewhat difficult to determine, with anything like accuracy, the share of each in producing the floods; but in some rivers, as the Ganges and Brahmaputra, the increase from this cause is distinctly observable, as it occurs some time after the rains have commenced, while in the case of the Indus it is the principal source of flood. When the increase from melted snow does not occur during the rainy season, we have the phenomenon of flooding occurring twice a year, as in the case of the Tigris, Euphrates, Mississippi, and others; but in most of these cases the grand flood is that due to the melting of the snow or ice about the source. In illustration of the enormous variation in the volume of rivers subject to periodical rise and fall, we shall give a few instances in which the minimum and maximum delivery per second have been ascertained:

DELIVERY IN CUBIC FEET PER SECOND.

	Minimum.	Maximum.	Average for a Year.
Nile (at Assuan)...	24,000	362,000	101,000
Ganges.....	36,000	494,000	141,000
Irrawadi.....	84,000 (?)	1,000,000 (?)	350,000
Brahmaputra.....	146,000	1,800,000 (?)	520,000

The advantages of this periodical flooding in bringing down abundance of rich fertile silt—the Nile bringing down, it is said, no less than 140 millions of tons, and the Irrawadi 110 millions of tons annually—are too well known to need exposition here. Islands are thus frequently formed, especially at a river's mouth (see DELTA). Permanent and capacious lakes in a river's course have a modifying effect owing to their acting as reservoirs, as is seen in the St. Lawrence; while the Red River (North) and others in the same tract, inundate the districts surrounding their banks for miles. In tropical countries, owing to the powerful action of the sun, all rivers whose source is in the regions of perpetual snow, experience a daily augmentation of their volume; while some in Peru and Chili, being fed only by snow-water, are dried up regularly during the night.

The course of a river is necessarily the line of lowest level from its starting-point, and as most rivers have their sources high up a mountain slope, the velocity of their current is much greater at the commencement. The courses of rivers seem to be partially regulated by geological conditions of the country, as in the case of the San Francisco of Brazil, which forms with the most perfect accuracy the boundary-line between the granitic and the tertiary and alluvial formations in that country; and many instances are known of rivers changing their course from the action of earthquakes, as well as from the silting up of the old bed. The inclination of a river's course is also connected with the geological character of the country; in primary and transition formations, the streams are bold and rapid, with deep channels, frequent waterfalls and rapids, and pure waters, while secondary and alluvial districts present slow and powerful currents, sloping banks, winding courses, and tinted waters; the incline of a river is, however, in general very gentle—the average inclination of the Amazon throughout its whole course being estimated at little more than 6 inches per mile, that of the Lower Nile less than 7 inches, and of the Lower Ganges about 4 inches per mile.

The average slope of the Mississippi throughout its whole length is more than 17 inches per mile, while the Rhone is, with the exception of some much smaller rivers and torrents, the most rapid river in the world, its fall from Geneva to Lyon being 80 inches per mile, and 82 inches from Lyon to its mouth.

The velocity of rivers does not depend wholly on their slope; much is owing to their depth and volume (the latter being fully proved by the fact that the beds of many rivers remain unaltered in size and slope after their streams have received considerable accessions, owing to the greater rapidity with which the water runs off); while bends in the course, jutting peaks of rock or other obstacles, whether at the sides or bottom, and even the friction of the aqueous particles, which, though slight, is productive of perceptible effect, are retarding agencies. In consequence, the water of a river flows with different velocities at

different parts of its bed; it moves slower at the bottom than at the surface, and at the sides than the middle. The line of quickest velocity is the line drawn along the center of the current, and in cases where this line is free from sudden bends or sharp turns, it also represents the deepest part of the channel. The average velocity of a river may be estimated approximately by finding the surface-velocity in the center of the current by means of a float which swims just below the surface, and taking four-fifths of this quantity as a mean. If the mean velocity in feet per minute be multiplied by the area of the transverse section of the stream in square feet, the product is the amount of water discharged in cubic feet per minute. According to Sir Charles Lyell, a velocity of 40 feet per minute will sweep along coarse sand; one of 60 feet, fine gravel; one of 120 feet rounded pebbles; one of 180 feet (a little more than two miles per hour), angular stones the size of an egg. The rate of its progression, and a general description of the erosive action of rivers, will be found under WATERFALLS.

Rivers are the irrigators of the earth's surface, adding alike to the beauty of the landscape and the fertility of the soil; they carry off impurities and every sort of waste debris; and when of sufficient volume, they form the most available of all channels of communication with the interior of continents. . . . They have ever been things of vitality and beauty to the poet, silent monitors to the moralists, and agents of comfort and civilization to all mankind.' By far the greater portion of them find their way to the ocean, either directly or by means of semi-lacustrine seas; but others, as the Volga, Sir-Daria (Jaxartes), Amu-Daria (Oxus), and Kur (Araxes), pour their waters into inland seas; while many in the interior of Asia and Africa—as the Murghab in Turkestan, and the Gir in the south of Morocco—lose themselves in the sands, partly, doubtless, owing to the porous nature of their bed, but much more to the excessive evaporation which goes on in those regions. The following are a few of the chief rivers in each continent, with the lengths of their courses in English statute miles, and their drainage areas in English geographical square miles (the Thames is given as a standard of comparison):

EUROPE.

	Length.	Drainage Area.
Thames.....	220	5,000
Vistula.....	598	57,000
Loire.....	598	34,000
Rhine.....	690	65,000
Elbe.....	787	42,000
Dwina.....	1041	106,000
Don.....	1104	168,000
Dnieper.....	1243	170,000
Danube.....	1722	234,000
Volga.....	2762	397,000

ASIA.

Euphrates.....	1716	193,000
Ganges.....	1557	391,000*
Indus.....	1800	372,000
Maykan or Mekhong.....	2417	216,000†
Thaluan or Salwin.....	2152	381,000
Irrawadi.....	2532	
Hoang-ho.....	2624	537,000
Obi.....	2670	925,000
Amur.....	2739	583,000
Lena.....	2762	594,000
Yenesai.....	3822	785,000
Yang-tze-kiang.....	3314	548,000

AFRICA.

Zambesi.....	1400	432,000
Congo or Livingstone.....	2400 (?)	(?)
Nile.....	3300	520,000

AMERICA.

St. Lawrence.....	2072	298,000
Rio Bravo de Norte.....	2138	180,000
La Plata.....	2210	886,000
Mackenzie.....	2440	442,000
Amazon.....	3545	1,512,000
Mississippi.....	3716	982,000

In Law, when a river not navigable forms the boundary of property, it is taken to belong in equal halves to the proprietors on opposite sides; and when both sides belong to one owner, then the whole of the bed belongs to him. In the common case where it is a boundary, an imaginary line, called the *medium fluvium*, runs down the middle, and all the bed of the river on one side belongs to the proprietor of the land on that side. This rule refers to the soil under the water, which is as absolutely the property of the riparian owner as the banks of the river themselves. As regards

* Excluding Brahmaputra, 1800 miles long, with basin of 361,000 sq. m.
† Including basin of Menam.

the water, it is true that the riparian owner on his side of the middle line has not the absolute property of the water itself, but he can use it to a limited extent—as, for example, to water his cattle, to supply the wants of his house, &c. The right of abstracting quantities of water is limited to this extent, that if, by taking more than the usual quantity required for necessary purposes, the rights of other riparian owners further down are materially injured, then the latter can bring an action to recover damages for such injury. Thus, if a riparian owner or his tenant had a mill on the river which had existed thirty or forty years, and a riparian owner further up has materially diminished the volume of water, an action of damages will be competent. So one owner cannot alter the bed or embank the river so as to injure other owners. With regard to fishing, each riparian owner has a right to fish in his half of the river, and to catch all he can find there, subject to the restrictions of the Fishery Laws. (Paterson's *Fishery Laws of the United Kingdom*.) In Scotland, the riparian owner, unless he has a grant from the crown, cannot meddle with salmon so far as net-fishing is concerned, though he may fish for salmon with the rod.

It follows that a riparian owner, when fishing with the net or rod, cannot go beyond his own half of the stream; and if he cast his line beyond the mid-stream, he would be liable to an action of trespass. But it is usual for opposite riparian owners to allow each other to fish the whole stream, for this is more convenient to both parties. The restrictions as to the times of fishing and the size of nets are stated under FISHERY. Where a river is navigable, the soil belongs to the crown, and the public have *prima facie* a right to fish in it, though individuals may prove a title to a several or exclusive fishery there, but the burden of proof lies on such individuals. As between navigation and fishing, the right of navigation is paramount, and the fisherman must yield to the navigator.

The *Poisoning of Rivers* has begun of late years to cause serious concern, in consequence of the extension of manufactures, many of which are situated on the banks of streams, and use such streams as a drain or sewer. No person has a right so to poison or pollute a stream, and if he do so, any of the persons whose lands abut on the stream lower down may bring an action to recover damages. But if these tolerate the nuisance without complaint for twenty, or, at all events, forty years, they are forever afterwards precluded from complaining. Hence, in most cases, the manufacturers who pollute streams must be able to prove that they have been in the practice of doing so without challenge for twenty, or at most forty years. As, therefore, the law was defective in guarding salmon-rivers from this danger, the English Salmon Fishery Act enacted that all persons who poison streams without a legal right of this kind shall be liable to fine; and, moreover, even when they have the legal right, they must prove that they have used all reasonable means to counteract the ill effect of their refuse. Whoever unlawfully or maliciously puts lime or other noxious material in a pond or water with intent to destroy the fish therein, commits a misdemeanor, and may be sentenced to seven years' penal servitude. In Ireland and Scotland, the law does not materially differ from that of England as to poisoning rivers and streams; and it is an offence to put lime into streams to kill fish.—Paterson's *Fishery Laws of the United Kingdom*.

Besides the offences declared by the Salmon Acts of the United Kingdom, there are also similar penalties for poisoning waters, imposed by the Water-works Clauses Act, 10 Vict. c. 17, s. 61; the Public Health Act, the Nuisances Removal and other sanitary acts. See also the Rivers Pollution Prevention Act, 1876.

RIVER-CRAB (*Thelphusa*), a genus of crabs inhabiting fresh water, and having the carapace, quadrilateral, the antennæ very

is often brought to market tied on strings, at such distances as to prevent fighting and mutilation. This crab spends the winter deeply imbedded in the mud.—Other species are common in warm countries. *T. cunicularis* is very abundant on the Ghauts of the Deccan, in India, burrowing in the ground, and running about among the long grass. It runs with considerable swiftness, even when encumbered with a bundle of food as big as itself; this food is grass, or the stalks of rice; and it is amusing to see the crabs sitting, as it were, upright, to cut their hay with their sharp pincers, and then waddling off with their sheaf to their holes, as quickly as their side-long pace will carry them.

RIVER-TERRACES occur in some valleys, and exhibit the action of the river in scooping out its bed when it flowed at a higher level than it does now. The terrace consists of a more or less steep cliff, a few feet, or it may be yards high, with a flat terrace on a level with the top of it. The cliff corresponds to the present bank, and the terrace to the alluvial plain through which the river runs. The cliffs and terraces are repeated several times in some river-basins, and they frequently correspond on the two sides of the valley. They follow the course of the river, sloping downwards, with an inclination similar to the descent of the stream. They differ in this respect from the parallel roads formed by standing water. See GLENROY.

RIVET, a metal pin for connecting two plates of metal or other material together. The rivet is put through holes in both plates, and the projecting ends are then beaten down so as to represent the head of a nail on each side, and thus hold the plates in close contact. Rivets are of most essential importance in boiler and tank making, and in building iron ships. They are often put through the holes and beaten down while red-hot, in order that the contraction of the rivet, as it cools, may produce more intimate contact of the plates. The principle of the *riveting-machine* is simply the bringing a powerful lever to bear upon the head of the rivet, so that the smith can hammer upon the other and softened end without displacing it.

RIVIERA (sea-shore, coast), a term applied to the narrow strip of coast-land, bordering the Gulf of Genoa from Nice to Spezzia. Between Nice and Genoa it is called the Riviera di Ponente, or western coast, and the part from Genoa to Spezzia, the Riviera di Levante, or eastern coast. It abounds in the most striking scenery, uniting beauty with grandeur. The modern road that traverses it was a work of formidable difficulty; it was begun under French rule, and finished by the Sardinian government after the fall of Napoleon. The old road, which was dangerous and almost impracticable, was known as the Corniche road, and this name is often applied to the modern one. A railroad throughout the whole length of the Riviera has recently been completed.

RIVOLI, a town of Northern Italy, on the right bank of the river Dora, 8 miles west of the city of Turin. Pop. 5600.—R. must not be confounded with the village of the same name in the province of Verona, near which took place in 1797 one of Napoleon's most decisive victories over the Austrians.

RIZAH, a town of Asiatic Turkey, in the pashalic of Trebizond, on the coast of the Black Sea, 40 m. E. from Trebizond, with considerable trade, and manufactures of fine hempen fabrics. Pop. 30,000.

RIZZIO. See RICCIO.

ROACH (*Leuciscus rutilus*, see LEUCISCUS), a fish of the family

Roach (*Leuciscus rutilus*).

Cyprinidæ, very plentiful in many of the lakes, ponds, and slow-running rivers of England and of the south of Scotland. It is also found on the continent of Europe. It is seldom more than a pound in weight, although it has been known to reach five pounds. The upper parts are dusky-green with blue reflections, passing into silvery-white on the belly, the fins more or less red. The R. is gregarious, and the shoals are often large. It is partially migratory, ascending rivers from lakes—as from Loch Lomond—to spawn. It is not much esteemed for the table. It is generally caught with bait, but sometimes with a small fly.

ROAD, in the law of Scotland, is used in the same sense as Highway (q. v.) in England. Road trustees are persons who are

River-Crab (*Thelphusa depressa*).

short. One species (*T. depressa*), the *Grancio* of the Italians, is very common in the south of Europe, and is often figured on ancient Greek medals. It was in ancient times, as it still is, an esteemed article of food. It is much used in Italy during Lent. It inhabits muddy lakes and slow rivers. In some it absolutely swarms. It can be kept alive in a damp place for a long time. It

authorized by act of parliament to make and manage a particular road, and levy tolls from the public to pay the expense. In England, road trustees necessarily mean the trustees of a turnpike road, the ordinary highways being repairable by the parish. In Scotland, by the early statutes, public roads were placed under the general management of the commissioners of supply and justices of the peace; but later local statutes authorized trustees to apportion statute labor amongst the local inhabitants for highways not turnpike. General Road Acts were passed, 1 and 2 Will. IV. c. 43 to 25 and 26 Vict. c. 105. By the Roads and Bridges (Scotland) Act, 1878, tolls and statute labor, where not already abolished, cease in 1883; the county roads are placed under one trust, with separate district management. The expense of maintenance falls, by assessment in each district, equally on the tenant and proprietor.

ROADS AND ROAD-MAKING. Roads form a primary element in the material advancement of a nation, being essential to the development of the natural resources of the country. Canals and railways have no doubt, in modern times, superseded to some extent the common highways; still, these retain their importance, were it only as essential auxiliaries.

The Romans were great constructors of roads, and regarded them as of vital importance for conquest and the maintenance of their empire. They are said to have learned the art from the Carthaginians. Except, where some natural barrier made it impossible, the Roman roads were almost invariably in a straight line; probably because the chief means of transport then in use were beasts of burden, and not wheeled vehicles, which made the preservation of the level of less consequence. The substantial character of the Roman roads is well demonstrated by the fact, that they have in some instances borne the traffic of 2000 years without material injury. The plan of construction was pretty uniform, being that described in the article on the **APPIAN WAY**, one of the earliest and most famous of them. They varied in breadth from 15 to 8 feet, and had often raised footpaths at the sides, and blocks of stone at intervals, to enable travelers to mount on horseback.

The roads made by the Romans in Great Britain gradually fell into decay, and the attempts that were now and then made to repair them were insufficient to prevent England falling into a worse state with respect to its highways than most other European countries. In 1285, one of the earliest laws on the subject of roads was passed. It directed that all trees and shrubs be cut down to the distance of 200 feet on either side of roads between market-towns, to prevent the concealment of robbers in them. The first toll for the repair of roads was levied by the authority of Edward III. in 1346, on roads which now form part of the streets of London. In 1555, an act was passed requiring each parish to elect two surveyors of highways to keep them in repair by compulsory labor; at a later period, in place of the compulsory labor, the 'statute labor-tax' was substituted. But long after this, the roads even in the neighborhood of London were wretchedly bad, and in the other parts of the country, they were still worse. For the most part, indeed, they were mere horse-tracks; the chief advantage in following them being, that they led along the higher grounds, and so avoided bogs. These trackways were usually impassable in winter; being narrow, and in many places so deep and miry as to be liker ditches than roads. So late as 1736, the roads in the neighborhood of London were so bad that in wet weather a carriage could not be driven from Kensington to St. James's Palace in less than two hours, and sometimes stuck in the mud altogether. Much curious information on the state of the roads and means of conveyance in England during the long period which elapsed from the decay of the Roman roads to the middle of the last century, will be found in vol. i. of *Smiles's Lives of Engineers*.

In laying out a new line of road, the skill and ingenuity of the engineer are taxed to make the gradients easy, with as little expense as possible in excavating and embanking (see **EMBANKMENT**), and to do so without deviating much from the direct course between the fixed points through which the road must pass. In order to do this, an accurate survey of the tract, including the relative levels of its different parts, and the nature of the strata, is a necessary preliminary. The formation of an extended line of road often involves the construction of extensive bridges, viaducts, and the like, which require the greatest engineering skill.

The importance of easy gradients or inclinations in roads is well understood in a general way; but it gives a more precise idea of it to state that, while, for example, the force requisite to draw a wagon weighing 6 tons along a level macadamized road is 264 lbs., on a road with an ascent of 1 in 70 the force required is 456 lbs., i. e., $\frac{1}{70}$ th part of 6 tons over and above 264 lbs. The greatest declivity which can be given to a road, so that horses may move down it with safety in a fast trot, varies according to its nature; for paved roads, 1 in 63—for those which are macad-

amized, 1 in 35—and for those laid with gravel, 1 in 15, have been considered the limit.

What is the best transverse form for a road, is a much debated question among engineers. All agree that it should be higher in the middle than at the sides, but some think it should be much higher than others. As a road can be better kept clear of water by a slight inclination in the direction of its length, than by any form which can be given to its cross-section, it seems preferable that it should be as nearly flat as possible, because every part of its breadth will then be equally available for traffic; whereas it is almost necessary to keep on the center of a highly convex road,

Fig. 1.—Cross Section of a Road.

A, Foundation of rough pavement or concrete; B, Broken stones.

and consequently wear deep furrows there, by confining the wheels and horses to pretty much the same track. Fig. 1 shows a transverse section of a road of an approved form, the slope is 1 in 30, with a few feet in the center on a flat curve.

Different opinions are also held as to whether the bed upon which the road is to be formed should be flat or rounded; those who prefer it flat considering that there should be a greater depth of material at the center than at the sides, while others think that the depth should be uniform.

As respects the construction of the road itself, the first point to consider is the foundation. The majority of roads have no artificial foundation. In such cases, the surface on which the road-material is to be laid, is generally made as solid as possible by means of efficient drainage, and by rolling and beating wherever there are embankments formed. It is the question whether or not a road should have a foundation of rough pavement below the broken stone covering, which is the essential point of difference between the two great rival systems of Telford and Macadam. Telford considered it of great importance that there should be such a foundation. He made it of stones varying in depth from nine inches at the center to three inches at the sides of the road, these being set with their broadest edge downwards, and no stone being more than four inches broad upon the upper edge; upon these were placed a coating of broken stones not exceeding six inches in thickness. The Glasgow and Carlisle and the Holyhead roads are excellent examples of the enduring character of those made on Telford's plan.

In our biographical notice of Macadam (q. v.) will be found a reference to his method of road-making. Suffice it here to say that he preferred a yielding and soft foundation to one which was rigid and unyielding, so that even on boggy ground, if it were but firm enough to allow of a man walking over it, he considered an artificial bottoming quite unnecessary. His roads were formed entirely of angular pieces of stone, of such a size as to pass freely through a ring 24 inches in diameter. This plan has now fewer advocates than Telford's, or than the one subsequently proposed by Mr. Thomas Hughes, where a concrete of gravel and lime is employed for the foundation of the road. But experience has shown that Macadam's plan of employing angular pieces of stone is superior to every other as a mere covering for roads, whether they have an artificial foundation or not. So popular at one time was the system of macadamizing, that expensively paved streets, such as that between Edinburgh and Leith, were torn up to be reformed on the new plan. Dublin has been instanced as an example of the failure of Macadam's plan for the streets of a populous city. There the macadamized streets are in winter constantly covered with mud, and in summer, profuse watering is required to keep them from being overwhelmed with dust. It is curious, however, that the French road-engineers have, in recent years, come to the conclusion, that a covering of broken stone alone is sufficient on the most frequented roads and under all but the very heaviest traffic.

With regard to the kind of stone suitable for covering roads, granite and the different kinds of greenstone and basalt, ordinarily called whinstones, are the only kinds admissible. Sandstone is too easily crushed, limestone is objectionable from its slight solubility in water. The stone employed should be tough as well as hard. Flint is hard enough, but it is brittle, and easily crushed to powder. The object is to get it to bind into a firm mass, and not to roll about, after it has been laid down for some time.

Little need be said about the drainage of roads, notwithstanding its great importance, because it will be apparent from what has been said, that it is in great part secured by the plan on which a road is made. What further drainage a road requires, can, in many situations, be effected by ditches on either side. Where this

is not possible, as in the case of portions situated in cuttings more or less deep, proper drains require to be constructed. In such circumstances, a drain is either made down the center, with branch-drains from the sides running into it; or drains are formed along the sides, with gratings at proper intervals to take in the surface-water. If the ground beneath the road is composed of clay or of any kind of wet soil, under-drainage must be resorted to; and of course, wherever there are footpaths, small drains require to be placed under them, if there is no other means of carrying off the water from the channel between them and the road.

ROANNE, a thriving town of France, in the department of Loire, and, after St. Etienne, the most important town in the department for industry and commerce, stands on the left bank of the Loire, which is here navigable, 52 miles by railway north-west of Lyon. Its streets are wide, and its houses handsome. The chief structures are the bridge over the Loire, the public library, and the college buildings. There are important manufactures of muslins, calicoes, and woollen and other fabrics. Ship-building is carried on at the several dockyards. R. is also a most important entrepôt for commerce between the north and south of France. Pop. (1876) 21,472. Around and within the town are to be found numerous traces of the ancient rule and civilization of the Romans.

ROANOKE, a river of Virginia and North Carolina, U.S., formed by the union, at Clarkesville, Virginia, of the Dan and Staunton rivers, which rise in the Alleghanies, flows south-east through the north-eastern portion of North Carolina, and empties into Albemarle Sound. It is navigable for large vessels to Weldon, head of tide-water, 150 miles; its length is 260 miles. In 1861, Albemarle Island, at its mouth, and Plymouth, were taken by the federal gunboats.

ROARING, a disease of the air-passages of the horse, is characterized by a grating, roaring noise, most noticeable during inspiration, and when the animal is galloped in heavy ground. It usually depends upon wasting of some of the muscles of the larynx; is apt to result from frequent attacks of cold, from strangles, inflammation of the neck-vein, or from tight reining. It constitutes unsoundness, unfits the animal for the satisfactory performance of fast work, is apt gradually to become worse, when a sharper whistling noise is produced, and is seldom curable. In recent cases, a dose of physic should be given, a smart blister applied to the throat, or a seton inserted. As in broken-winded subjects, the breathing is much less distressed when the horse is fed and watered several hours before being required to exert himself. He should have a liberal supply of good oats, but only a limited allowance of hay, which should be given damped. In bad cases, tracheotomy may be performed, and a pipe inserted in the windpipe, with which we have known heavy draught-horses work regularly for years.

ROASTING. All the apparently numerous forms of cookery may be reduced to two, viz., Roasting and Boiling (q. v.). In this general sense, roasting may be held to include broiling, baking, and all other processes which consist essentially in the exposure of food to the action of heat without the presence of any fluid excepting its own natural juices. Chemistry and experience alike teach that the first application of heat in roasting should be powerful and rapid, so as to form an external wall, by hardening the skin, and coagulating the superficial albuminous juices, and thus retain the deep-seated juices as much as possible within the meat. This external crust is usually formed in about 15 minutes, after which the meat should be removed to a greater distance from the fire, and allowed to cook slowly. The evaporation of the internal juices may be further restrained by the free and early application of flour—a process known as dredging. The loss of weight in roasting is greater than that in boiling; but it is mainly due to the melting out of fat and the evaporation of water, while the nutritive matter remains in an easily digestible form in the interior. Rules for calculating the time a joint of given weight requires for roasting, are given in all the ordinary cookery-books. Unless the roasting is continued long enough, those parts which are nearest the center do not become hot enough to allow the albuminous matters to coagulate, and hence they appear red, juicy, and *underdone*, as it is commonly called. The exact nature of the chemical changes which occasion the peculiarly agreeable odor of roasted meat is still unknown.

ROB, the Spanish name of a conserve of fruits. It is derived from the Arabic *roob*, signifying the juice of fruit, boiled to a sufficiently thick consistency to keep, and is supposed to have been taken from its similarity to the saccharine pulp of the locust-pods, called *Al-garoba* by the Moors. The juices of strawberries, raspberries, gooseberries, currants, &c., are boiled with sugar until they form *robs*, and are in that state used for flavoring drinks, &c.

ROBBERY is larceny from the person, preceded by violence or the fear of violence. By the present statutory law of England and Ireland, 24 and 25 Vict. c. 96, whoever robs a person is guilty

of felony, and liable to penal servitude, not exceeding fourteen years, and not less than three years; or to imprisonment not exceeding two years, with or without hard labor. If, on the trial for robbery, it appear to the jury that the party charged did not commit the crime of robbery, but committed an assault with intent to rob, the party shall not be acquitted, but shall be found guilty of the assault with intent to rob. The punishment of an assault with intent to rob is penal servitude for three years, or imprisonment not exceeding two years. To constitute simple robbery, there must be what is called asportation, or a seizure of the goods. Thus, where the thief, in pulling a purse out of a pocket, could not disentangle it from keys in the pocket, and so the purse never left the pocket, it was held not robbery; but where a thief detached a lady's earring, which became lost in the curls of her hair, it was held to be robbery. In the law of Scotland, robbery also means the violent or forcible taking away of property from the person, while stouthrieff means the same offence in or near a dwelling-house.

ROBERT OF GLOUCESTER, an old English (metrical) chronicle, of whom absolutely nothing is known, except that he was alive about the time of the great battle of Evesham (1265). Robert's work is a 'history' of English affairs from the arrival of the fabulous Brutus down to the end of Henry III.'s reign; and is valuable partly for its matter (though that is in the main taken from Geoffrey of Monmouth and William of Malmesbury), but more for the language, which is there seen in its transition from Anglo-Saxon to the English of Chaucer and Wycliffe. It is written in verse, contains more than 10,000 lines, and—if we may judge from the numerous copies that were made of it—was very popular in the middle ages. The principal extant manuscripts are the Bodleian, the Cottonian, and the Harleian. The Chronicle was printed by Hearne, in 2 vols., 1724, a reprint of which appeared in 1810.

ROBERT I. (of Scotland). See **BRUCE**.

ROBERT II. king of Scotland, 1371—1390, was born March 2, 1316, only two years after the battle of Bannockburn. His father was Walter Stewart, and his mother, Marjory, only daughter of Robert the Bruce. R. lost both his parents in infancy. During the disastrous reign of his uncle, David II., he was one of the most prominent of the patriotic nobles of Scotland, acting as regent, or joint-regent, during the minority and exile of his sovereign. He was present at the battles of Halidon Hill (q. v.) and Neville's Cross (see **BRUCE, DAVID**). On the death of David, he obtained the crown, and became the founder of the Stewart dynasty, in virtue of the law of succession adopted by the Council of Estates held at Ayr in 1315. Partly from disposition, and partly from the infirmities of age, R. proved a peaceable, though not exactly a pusillanimous ruler. Such wars as were waged with England, were not only conducted, but actually organized, by his powerful and intractable barons, particularly the Earls of Douglas, Mar, March, and Moray, who shaped the policy of the country very much according to their pleasure. The misery inflicted on both sides of the borders by the raids of these warlike chiefs, and the reprisals of the English wardens—the Percies and others—was frightful; famine and pestilence became chronic; but the most celebrated incidents of R.'s reign were the invasions of Scotland by an English military and naval force under the command of the Duke of Lancaster ('old John of Gaunt, time-honored Lancaster'), in 1384, and again by King Richard II. himself, in 1385, which wasted the land as far as Edinburgh and Fife; and the grand retaliatory expedition of the Scotch in 1388, when two armies invaded and devastated England: the larger, under the Earls of Fife and Strathearn, Archibald Douglas, surnamed the Grim, Lord of Galloway, and the Earls of Mar and Sutherland, penetrating by way of Carlisle; the smaller, under James Earl of Douglas (the 'doughty Douglas'), and the brothers Dunbar, Earls of Moray and March, by way of Northumberland. Both were completely successful. What gives a special interest to the movements of the smaller body, is the fact, that on its return home it fought and won, though at the expense of the life of its gallant leader, the brilliant battle of Otterburn, July 21, 1388. See **CHEVY CHASE**. R. died at his castle of Dundonald, in Ayrshire, April 19, 1390. According to Buchanan (not, however, a very accurate historian), he labored honestly to suppress the internal disorders of the country; but, like most of the Stewarts, he was profligate in his habits. His favorite mistress, Elizabeth Mure of Rowallan, became his second wife.

ROBERT III., king of Scotland, son of the preceding, was born about 1340. His baptismal name was John, but this name, for reasons not ascertained, was changed on his accession to the throne in 1390, by an act of the Scottish Estates or parliament. His imbecility as a ruler virtually placed the reins of government in the hands of his ambitious brother, Robert, Earl of Menteith and Fife, whom, in 1398, he created Duke of Albany—during whose regime the Scottish barons first began to exercise that anarchic and disloyal authority, which, in the reigns of the first

three Jameses, threatened to destroy the power of the sovereign altogether. The principal events in R.'s reign were the invasion of Scotland, in 1400, by Henry IV. of England, who, at the head of a large army, penetrated as far as Edinburgh, but did not inflict much injury on the country, more, however, from clemency than impotence; and the retaliatory expedition of the Scotch, in the following year, under Archibald Douglas, son of the grim Earl, which resulted in the terrible disaster at Homildon Hill (q. v.). R. had two sons, the eldest of whom was David, Duke of Rothesay, a youth not destitute of parts, but shockingly licentious. As long as his mother lived, he kept within bounds, comparatively speaking; but after her death, says Buchanan, 'he gave an unbridled license to his passions; laying aside fear and shame, he not only seduced married ladies and virgins of good family, but those whom he could not entice, he forced to his embraces.' Albany received orders from the king to act as his guardian, and after a short time, starved him to death in his castle of Falkland—for which he underwent a mock-trial by his own creatures, and was of course declared innocent. Sir Walter Scott has given the traditional version of this tragedy in his romance, *The Fair Maid of Perth*. R. now became anxious for the safety of his younger son, James; and after consulting with Wardlaw, Archbishop of St. Andrews, he resolved to send him to France; but, while proceeding thither, the vessel in which he sailed was intercepted by an English cruiser, and James was taken prisoner in 1405. When his father received the melancholy news, he gave way to paroxysms of grief, and died at Rothesay in the following year.

ROBERTS, DAVID, R.A., a painter of great eminence, was born at Edinburgh on 24th October 1796, and began life there as apprentice to a house-painter. His talent for art becoming obvious, he was set to study at the Trustees' Academy; and in 1822 he went to London, where he found employment as a scene-painter at Drury Lane Theater. Clarkson Stanfield, since famous as a marine-painter, was then also working at Drury Lane, and between him and R. an affectionate intimacy ensued, which ceased only with life. In 1826, a picture of 'Rouen Cathedral,' exhibited by R. at the Royal Academy, drew attention by its marked ability. The year after, appeared his painting of 'St. Germain at Amiens.' Shortly after, he left England, and for seven years was engaged in sketching in Spain, Africa, and the East. As the result of his labors, there was given to the world in 1839 the splendid work, in 4 vols., entitled *Sketches in the Holy Land, Syria, Idumæa, Arabia, Egypt, and Nubia*. The book contains 246 subjects, lithographed by Louis Hague, and illustrated by a historical commentary furnished by Dr. Croly. It is the finest and most elaborate thing of the kind perhaps ever produced, and of itself it would have sufficed for a great reputation to the artist. Pending its appearance, he had resumed his contributions to the Academy, of which in 1839 he was elected an Associate; the full dignity of Academician being conferred on him two years after. From this time forward, he grew steadily in fame, and in 1854 he was selected by the Queen to paint for her the 'Inauguration of the Great Exhibition in 1851,' a task which he achieved with admirable success. In his chosen field of architecture, during all his later life, he was admittedly without a rival. In addition to his unremitting work for the Academy, he illustrated many books, and issued the admirable series of lithographs, 'Spanish Sketches,' which attained a great popularity. He died November 25, 1864.

ROBERTSON, FREDERICK WILLIAM, M.A., an English preacher, was the son of a Scotch gentleman, Captain Frederick Robertson of the Royal Artillery, and was born in London 3d February 1816, in the house of his grandfather, Colonel Robertson. At the age of nine, he was sent to the grammar-school of Beverley, in Yorkshire, where he remained for a few years, and then accompanied his parents to the continent, where he became a proficient in French. In 1832, he entered the rector's class at the Edinburgh Academy, and there competed, we are told, 'all but successfully,' for the highest classical honors of the institution with James Moncreiff (now Lord Justice-clerk for Scotland). Next year R. proceeded to the Edinburgh University, and while there, had for private tutor the Rev. Charles Terrot, subsequently Bishop of the Scottish Episcopal Church in the same city. He was originally designed for the bar, but the study of law did not prove interesting to him, and he would gladly have become a soldier, for he always felt (as he afterwards confessed) 'an unutterable admiration of heroic daring'; but certain difficulties intervened in the way of obtaining a commission, and R., in obedience to the wish of his father, entered Brasenose College, Oxford, to study for the church, in 1836. His life had all along been marked by its singular purity and depth of religious feeling; hence his new career inspired him with no regret, but rather with a high resolve to be worthy of his calling. His first appointment was to the curacy of St. Maurice and St. Mary Calendar, but his health broke

down in the course of a year, and he was compelled to visit the continent.

On his return to England, he was for a time curate to the incumbent of Christ Church, Cheltenham, whence, in the beginning of 1847, he removed to St. Ebbs, Oxford, and was just beginning to attract the notice of the undergraduates at Oxford, when he was offered the incumbency of Trinity Chapel, Brighton. His 'career' in Brighton—though it is perhaps wrong to describe a life so pure, delicate, unselfish, devoted as his, by a term expressive of vulgar ambition—was brief but glorious. For six years he continued to preach sermons, the like of which, for blending of delicacy and strength of thought, poetic beauty, and homely lucidity of speech, had perhaps never been heard before in England. R. was unhappily (for his comfort) not very 'orthodox'; consequently, he was long misunderstood, and vilified by the 'professedly religious portion of society;' but so true, so beautiful was his daily life and conversation, that he almost outlived those pious calumnies, and his death (from consumption, August 15, 1853) threw the whole town into mourning. His sermons (of which four series have been published) have attained great popularity and a very large circulation. The first series was published in 1855 (11th edition, 1865). R.'s *Expository Lectures on St. Paul's Epistle to the Corinthians* appeared in 1859. His *Lectures and Addresses on Literary and Social Topics* contain passages of faultless beauty and refinement; but as they were delivered to mixed audiences, and never intended for publication, they do not perhaps exhibit that rigorous intellectual grasp of a subject, or that strong and searching criticism of which their author was so capable. A good biography, with letters, was published in 1865 by the Rev. Stopford A. Brooke (5th ed., 1868).

ROBERTSON, JOSEPH, the most accomplished Scottish antiquary of the present century, was born at Aberdeen on the 17th day of May 1810. He was educated at Udny, in his native county, at the grammar-school of Aberdeen, and afterwards at the Marischal College there. The law was chosen for him as his profession, but his heart was not in the task, and from an early age he devoted himself to literature. His chief attention then, as in his after life, was directed to researches connected with the history and antiquities of Scotland; and in 1833 he went to Edinburgh, the place of all others best adapted for the cultivation of his favorite studies. While there, he wrote, for Oliver and Boyd's Cabinet Cyclopædia, a volume on the *Circumnavigation of the Globe*, which was published in 1836. The work by which he became first generally known, *The Book of Bon Accord, or a Guide to the City of Aberdeen*, was published in 1839. It is justly styled by Mr. Charles Knight, in his *Life of Shakspeare*, 'a most lively, instructive, and learned volume—a model of guide-books.' A continuation of this work was promised, but was never completed. In the following year his *Delicia Literariæ, a new volume of Table-talk*, was published. In 1839, he returned to the north to undertake the editorship of the *Aberdeen Constitutional* newspaper; and in the end of that year, in conjunction with Mr. John Stuart, he founded the Spalding Club, a society instituted for printing the historical, ecclesiastical, genealogical, topographical, and literary remains of the north-eastern counties of Scotland. This society, formed on the model of the Bannatyne and Maitland Clubs, has printed many valuable works on Scottish archaeology, which otherwise would have been all but inaccessible. Its earliest publication was a *History of Scots Affairs from 1637 to 1641*, written by James Gordon, parson of Rothiemay, which was issued in three vols. in 1841, under the joint editorship of Mr. R. and Mr. Grub.

R. edited for the same Club a volume of *Collections for a History of the Shires of Aberdeen and Banff* (1843); three vols. of *Illustrations of the Topography and Antiquities of the Shires of Aberdeen and Banff* (1847, 1857, and 1862); and *Passages from the Diary of General Patrick Gordon of Auchleuchries* (1859). He also contributed to the fifth volume of the Miscellany of the Club, in 1852, a learned paper *On Scholastic Offices in the Scottish Church in the 12th and 13th Centuries*. In 1843, R. went to Glasgow to become editor of the *Glasgow Constitutional* newspaper. While in that city, he edited for the Maitland Club, in 1846, a volume containing the *Book of the Collegiate Church of St. Mary and St. Anne, Glasgow*, and the *Charterulary of the Black Friars of Glasgow*; and in 1847, the fourth volume of the Miscellany of the Club. In June 1849, he contributed to the *Quarterly Review* an article on Scottish Abbeys and Cathedrals, which has become a text-book for all who write on that subject. In the same year he once more took up his residence in the Scottish metropolis, on being appointed editor of the *Edinburgh Evening Courant*. He discharged his editorial duties at Aberdeen, Glasgow, and Edinburgh with faithfulness and ability; but he found a more congenial occupation, when, in 1853, he was appointed, through the Earl of Aberdeen, who knew and appreciated his merits, to the office which is now known as that of Curator of the Historical Department of the Register-house at Edinburgh. In 1863, he edited for the

Bannatyne Club the *Catalogues of the Jewels, Dresses, Furniture, Books, and Paintings of Mary Queen of Scots*. This volume contains a Preface which forms a most valuable contribution to the history of Mary's reign, and supplies information on almost all the controversies connected with her life. With the sanction and zealous encouragement of Sir William Gibson-Craig, Lord Clerk-register of Scotland, he projected the publication of a series of works connected with the history of Scotland, similar to those which have appeared in England under the direction of the Master of the Rolls.

The first volume of the series, the *Chronicles of the Picts and Scots*, has been edited by Mr. Skene, and several others have since been published. R. assisted in other literary undertakings, and was a valuable contributor to this *Encyclopædia*. His articles are generally connected with his favorite studies; among them are those on *ARCHÆOLOGY*, *BURGH*, *ST. COLUMBA*, *CRANNOGES*, the *CLDBES*, *DAVID I.*, the *FAMILY OF DOUGLAS*, *IONA*, *MARY STEWART*, and *OSSIAN*. The last and most important of R.'s works was his *Concilia Scotica*, printed in two vols., in 1866, for the Bannatyne Club. This work has done for the Scottish Church that which Archdeacon Wilkins did for the Church of England in his *Concilia Magna Britannicæ et Hibernicæ*. It contains the statutes of all the Scottish councils, whether provincial or diocesan, from the earliest period to the Reformation, printed carefully from the best authorities; and the Preface, which occupies the greater part of the first volume, is a learned and authentic history of the councils, and of everything bearing on the subject of them. The authorities are quoted with an accuracy and copiousness for which R. was remarkable, and which contrasts strongly with the carelessness in that respect which marks some popular historians of the present day. In April 1864, R. received the degree of LL.D. from the University of Edinburgh. He died on December 13, 1866, almost immediately after the publication of his *Concilia Scotica*. R.'s labors are not to be estimated merely by the works which appeared under his name, or which he is known to have written. There was hardly a work of any merit published during the last twenty years of his life, in connection with Scottish history and antiquities, to which he did not in some way or other give his assistance; and his assistance was given with a thorough heartiness which only those who have benefited by it can appreciate. No literary man of his time was more beloved by his friends and intimate associates. In the relations of private life, he was most exemplary.

ROBERTSON, WILLIAM, the historian, was born in the year 1731, in the county of Edinburgh, and in the parish of Borthwick, of which his father was minister. He went to school at Dalkeith, a few miles distant from his home; but in 1733, his father's appointment to a charge in Edinburgh gave him the opportunity of attending school and college there. He was licensed as a preacher in 1741, and in 1743 was ordained to the parish of Gladsimir, where the battle of Prestonpans was to be fought two years afterwards. In 'the '45,' he showed his zeal for the government cause by joining a body of volunteers formed in Edinburgh; and when the majority of his comrades saw that it was useless for them to attempt to defend the town, he, with a few whom he had infected with his ardor, went to offer their services to Sir John Cope.

The latter, conscious that he had already too many elements of imperfect discipline in his army, had the prudence to decline this offer. R. afterwards became a leader in what was called 'the Moderate' side in the ecclesiastical courts; and in 1758 was promoted to one of the Edinburgh charges, where he had increased opportunities of influence. In 1759, he published his celebrated *History of Scotland*. He avowedly passed over the earlier periods, speaking of them as 'dark and fabulous,' which no doubt they were in the hands of those who had treated them; but it may be regretted that R. did not bring his acuteness to bear on the materials for their elucidation. In 1762, he was made Principal of the university of Edinburgh. In 1769, he published the *History of the Reign of the Emperor Charles V.*, to which he prefixed a *View of the State of Society in Europe from the subversion of the Roman Empire to the beginning of the Sixteenth Century*. This is the most valuable of his works. The field has been often since gone over by authors who have discovered much new material, but all the use they have made of it has become a sort of tribute to the natural sagacity of Robertson. His *History of America* was published in 1777. These works are admirable for their elegant and vigorous style. R. died in 1793. He was a genial man, with a large circle of friends. He had great conversational powers, and was reputed to be fond of displaying them. Interesting notices of his early life will be found in the autobiography of his friend Dr. Carlyle, and a sketch of the closing years is given in Lord Cockburn's *Memorials of his Life and Times*.

ROBESPIERRE, MAXIMILIEN MARIE ISIDORE DE, was born 6th May 1758, at Arras, where his father was an unsuccessful advocate. Having distinguished himself at the college of his native

place, he was sent through the influence of a canon of the cathedral of Arras, to complete his education in Paris, at the College of Louis le Grand, where, by a singular chance, he found himself a fellow-student with Fréron, and Camille Desmoulins. In his studies, he was noted for diligence, regularity, and intelligence; and on the completion of his course at college, he devoted himself to the study of jurisprudence. After some years thus passed, he returned to Arras, to follow the profession of his father. In this his success was decided; and previous to the commencement of his more public career, he had become a person of considerable local note. While sedulously attending to his professional duties, he cultivated literature, not wholly without distinction; and in 1783 became a member of the Academy of Arras. Of the verses which, at this time, he seems to have been fond of writing, some curious fragments are preserved. Having, it is said, in discharge of his duty as member of the criminal court, been obliged to condemn a culprit to death, he resigned his situation on a point of conscientious objection to the barbarity of capital punishment—an incident sufficiently piquant in its contrast with subsequent portions of his history. On the memorable convocation of the States-general in 1789, he had local influence sufficient to secure his election as one of the deputies of the *tiers-état*, in which capacity he immediately repaired to Versailles. In the Assembly he was for some time of little account; but gradually he made for himself a position, and nice observers noted in him a quality of fanatical earnestness and conviction, in virtue of which they surmised for him a great career. 'This man,' said Mirabeau in particular, 'will go far, for he believes every word he says.' (*Cet homme ira loin, car il croit tout ce qu'il dit.*) Though in the Constituent Assembly he spoke frequently, and—despite the disadvantages of a mean person, a harsh shrill voice, and an ungainly manner—always with increasing acceptance, it was outside as a popular demagogue and leader in the famous Jacobin Club that his chief activity was exerted; and in this field his influence speedily became immense.

After the death of Mirabeau, whose giant figure, whilst he lived, seemed to dwarf all meaner men, his importance became more and more recognized; and from this time forward till his death, his biography is in effect the history of the revolution. In May 1791, he proposed and carried the decree by which members of the Assembly were excluded from a place in the legislature which succeeded; a measure obviously disastrous, as deteriorating the quality of the Assembly, and more and more insuring its subjection to the Jacobins, of whom R. was now the idol. His early aversion to capital punishment has been spoken of; and it is curious enough to be noted, *en passant*, that now, on the 30th May, he delivered an oration against it in the Assembly, denouncing it as 'base assassination.' On the dissolution of the Constituent Assembly in October 1791, R., now famous, revisited his native town, where he was received with enthusiasm; an escort of the National Guard did honor to his entrance, and a general illumination of the place testified the admiration of the citizens for their deputy. After a stay of seven weeks, he returned to Paris, and resumed his activity as a leader of the Jacobin Club. In the *émeute* of 10th August following, by which the king was dethroned, he took no prominent part; and though his complicity is suspected in the September massacres which ensued, no very distinct share in the infamy has ever yet been proved against him. To the National Convention, which was now formed, he was returned at the head of the Paris deputies; and as recognized chief of the extreme party called the Mountain, he was one of the main agents in procuring the execution of the king, which took place in December 1792. In the following year occurred his final struggle with the Girondists, who had twice before attacked him with a view to compass his destruction, and the chief men among whom he now triumphantly sent to the scaffold. The period of 'the Terror' followed: Marie Antoinette and the infamous Duke of Orleans were the first victims; Pétion, Danton, and Camille Desmoulins were next immolated, on a suspicion of favoring a reactionary policy; and for months, under the so-called Committee of Public Safety, Paris became the scene of an indiscriminate quasi-judicial slaughter, in which some thousands of lives were sacrificed. With these enormous atrocities, the name of R., along with those of his friends, Couthon and St. Just, remains peculiarly associated.

In the midst of the horror, took place, on 8th June, 1794, that strange *Fête de l'Être Suprême*, in which, in the name of the Republic, the existence of a Deity was decreed—a day of triumph for R., who, conspicuous as the first man of France, presided at the solemn mummeries. But the end was near; men were weary of 'the Terror,' and the general sense of insecurity it induced; R. had many enemies; in particular, the numerous friends of Danton were eager to avenge his death; a conspiracy was organized against 'the tyrant,' as he was now called, and after a scene of fierce tumult in the Convention, his arrest was accomplished. A rescue by the populace followed, but he lacked the courage and promptitude to turn the opportunity to account; whilst he

hesitated, his enemies acted, and in July, 1794, he closed his career on the scaffold to which he had sent so many others.

Though without great and heroic qualities, R. can scarcely have been the mean and contemptible creature he has not unfrequently been represented. The instant effect of his oratory we know; and even as read, his speeches command respect for the mental power they exhibit. The subtlest practical tact and judgment he must plainly have possessed; and though timid in his own person, he was dexterous to appropriate the results obtained by the boldness of others. In principle, he was severe and consistent; and the title of 'Incorruptible,' which he early acquired, seems throughout to have been thoroughly deserved. In private life, he was amiable; and though he waded to his public ends through blood, he had not the savage joy in the shedding of it which it has been common to attribute to him. He was callous, not actively cruel; and during the time of 'the Terror,' it is simply the truth, that he was rather reluctantly acquiescent, than active in the atrocities for which he has since been held above all others responsible. 'Death—always death!' he is said to have frequently exclaimed in private, 'and the scoundrels throw it all on me! What a memory shall I leave behind me, if this lasts! Life is a burden to me.' For a candid view of the character on this and its other sides, the more curious reader may be referred to the work on the subject by Mr. G. H. Lewes—*Life of Maximilien Robespierre, with Extracts from his Unpublished Correspondence* (London, Chapman and Hall, 1849). See also the Histories of Thiers, Mignet, Carlyle, Michelet, Louis Blanc, and Ernest Hamel's *Vie de Robespierre* (Par. 1865).

RO' BIN, besides being a familiar name of the Redbreast (q. v.) in Britain, and frequently given to the Bluebird (q. v.) in America, is also in America the usual name of a species of Thrush (q. v.) widely distributed from Mexico to lat. 60° N. It is nearly twice the size of the redbreast, olive gray, the top and sides of the head black, the chin and throat white with black streaks, the under parts chestnut brown. It remains during winter in sheltered places, even as far north as New England, but is generally a bird of passage. Many arrive in New England before the snow has disappeared. Large flocks are to be seen in the Southern States in winter, where great numbers are killed for the table, the markets being often glutted with them. In Massachusetts, the law forbids the killing of this bird at any season of the year. Its nest is often built near houses. Two broods are produced in the year. The robin is a lively bird, and a general favorite in the northern parts of the United States. It is often kept as a cage-bird, is very gentle and easily tamed, and has a pleasing song.

ROBIN GOODFELLOW, a name given in England to a domestic spirit or fairy, analogous in character to the *Nisse God-dreng* of Scandinavia, the *Knecht Ruprecht*, i. e., Robin, of Germany, and the *Brownie* of Scotland. Roguery and sportiveness were the characteristics of this spirit; and in the reign of Elizabeth, his existence was so generally credited, that he was 'famed in every old wives chronicle for his mad merrie pranks.' It was from the popular belief in this spirit that Shakespeare's *Puck* was derived. From the early ballads concerning R., we learn that he was the offspring of a 'proper young wench by a hee-fairy,' who was no less a person than Oberon, king of Fairyland. In his youth, R. displayed such mischievous tricks that his mother found it necessary to promise him a whipping. He ran away from home, and engaged with a tailor, from whom he also eloped. When tired, he sat down, and fell asleep, and in his sleep he had a vision of fairies. On awaking, he found lying beside him a scroll, evidently left by his father, which, in verses written in letters of gold, informed him that he should have anything he wished for, and also the power of turning himself into various shapes; but he was to harm none but knaves and queans, and was to 'love those that honest be, and help them in necessity.'

As a specimen of his 'mad pranks,' R. went one day to a wedding as a fiddler, and was a welcome guest; but in the evening 'then hee beganne to play his merry trickes in this manner. First, hee put out the candles, and then being darke, hee stricke the men good boxes on the eares; they, thinking it had bene those that did sit next them, fell a-fighting one with the other, so that there was not one of them but had either a broken head or a bloody nose. At this, Robin laughed heartily. The women did not scape him, for this handsomest hee kissed: the others hee pinched, and made them scratch one the other, as if they had bene cats. Candles being lighted againe, they all were friends, and fell againe to dancing, and after to supper. Supper being ended, a great posset was brought forth. At this, Robin's teeth did water, for it looked so lovely that hee could not keepe from it. To attaine to his wish, hee did turne himself into a beare: both men and women seeing a beare amongst them, ranne away, and left the whole posset to Robin. Hee quickly made an end of it, and went away without his money, for the sport hee had was better to him than any money whatsoever.'

Although R. was a sprite particularly fond of disconcerting and disturbing domestic peace, he was believed to be easily propitiated. If a bowl of milk, or curds and cream, were duly laid out for him, he would at midnight perform for the servants many household duties. If this were neglected, R. would revenge himself by pinching and otherwise annoying the inmates. The following passage in Shakespeare's *Midsummer Night's Dream* fully describes R.'s peculiarities:

Either I mistake your shape and making quite,
Or else you are that shrewd and knavish sprite
Call'd Robin Goodfellow; are you not he
That frights the maidens of the villagery;
Skims milk, and sometimes labors in the quern,
And bootless makes the breathless housewife churn;
And sometime makes the drink to bear no barm;
Misleads night-wanderers, laughing at their harm?
Those that Hobgoblin call you, and sweet Puck,
You do their work, and they shall have good-luck.

The *Mad Pranks and Merry Jests of Robin Goodfellow* have been reprinted from the edition of 1628, by the Percy Society, in 1841.

ROBI'NIA, a genus of trees and shrubs of the natural order *Leguminosæ*, suborder *Papilionaceæ*, having a 4-fid calyx, with the upper segment divided into two; stamens, nine united, and one free; the pod long and many-seeded. The species are widely diffused over the world. The most important is a North American tree, sometimes called the *Locust Tree* (q. v.), also known as the *False Acacia*, or *Thorn Acacia*, often simply designated *Acacia*. It was raised from seed in France by John Robin, about the year 1600, and gradually spread over the warmer parts of Europe and the south of Siberia. On account of its quick growth, its spines, and its property of submitting to be clipped into any form, it is very suitable for hedges. In the south of Europe, it succeeds well as a timber tree, but in more northern regions, it suffers from frost in severe winters; and in Britain it often suffers from frost, owing to the imperfect ripening of the wood in the summer. The wood is compact, hard, and takes a fine polish; for many purposes, it is scarcely inferior to oak, which it rivals in toughness and strength. It does not readily rot in water, and is used for shipbuilding. The tree is very ornamental, and of rapid growth. It is found wild in abundance from the Alleghanies to the Rocky Mountains. Its leaves are pinnate, with 9—13 thin and smooth leaflets. The flowers are fragrant and white, in large pendulous racemes. The roots throw up many suckers; and are very sweet, affording an extract resembling liquorice. An agreeable syrup is also made from the flowers.—*R. viscosa* is a smaller tree, but even more ornamental, a native of the south-western parts of the Alleghany Mountains. It has rose-colored scentless flowers. The young branches are viscid.—The *ROSE ACACIA* (*R. hispida*) is a native of the south-western ranges of the Alleghanies, and is a highly ornamental shrub, with hispid branches, and large rose-colored scentless flowers.—*R. Caragana* is a native of the south-east of Europe, and is planted for hedges at St. Petersburg, where it spreads like an indigenous plant.

ROBINS, BENJAMIN, a celebrated English mathematician and artilleryer, was born at Bath in 1707, of parents who belonged to the Society of Friends, and who were in such poor circumstances as to be unable to give their son a good education. R., however, having obtained a little instruction in mathematics, prosecuted this branch of science with great zest, and having acquired a good elementary knowledge of it, he removed, by the advice of Dr. Pemberton, to London, where he set up for a teacher of mathematics. During his leisure hours, he improved himself in his favorite subject by reading the works of the ancient and modern geometers, and by the study of the Latin, Greek, and several modern languages. He also published several mathematical treatises, which gained for him considerable reputation. R. next commenced the series of experiments on the resisting force of the air to projectiles, which has gained him so much celebrity, varying his labors by the study of fortification; a science with which he obtained a practical acquaintance by visiting many of the most celebrated works of this class in Flanders. In 1734, he demasqued in a treatise entitled *A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions*, the objections brought by the celebrated Berkeley, Bishop of Cloyne, against Newton's principle of ultimate ratios. His great and valuable work, the *New Principles of Gunnery*, upon the preparation of which he had spent an enormous amount of labor, appeared in 1742, and produced a complete revolution in the art of gunnery. Previous to R.'s time, it had never been attempted to estimate the velocity of balls otherwise than by the ordinary parabolic theory of Galileo (see *PROJECTILES*).

R. suggested two methods for obtaining this information—viz. (1), by finding experimentally the initial force of fired gunpowder confined to a certain space, and the law of the decrease of this force as the space increased, thence calculating the velocity which

would be imparted to a body of given weight; and (2) by the *Ballistic Pendulum*. The second method has been found in practice to be more preferable for accuracy. R., in the course of his experiments, also discovered and explained the curvilinear deflection of a ball from a vertical plane. Some of his opinions having been questioned in the *Philosophical Transactions*, R. ably replied to these objectors, and also wrote several dissertations on the experiments made by order of the Royal Society in 1746—1747, for which he received their annual gold medal. In consideration of his able defence of the policy of the then government, by means of pamphlets which he wrote and published from time to time, he received (1749) the post of 'Engineer-in-general to the East India Company;' but his first undertaking, the planning of the defences of Madras, was no sooner accomplished than he was seized with a fever, and though he recovered from it, his vital energy had been exhausted, and he died July 29, 1751. R. was considered as one of the most accurate mathematicians of his time. His mathematical works were collected after his death, and along with the details of his latest experiments in gunnery, were published by Dr. Wilson in 1761. It may also be mentioned that R. had some share (to what extent is now unknown) in the composition of Anson's *Voyage Round the World* (1740—1744).

ROBINSON, REV. EDWARD, D.D., LL.D., philologist and biblical scholar, was born at Southington, Connecticut, April 10, 1794, graduated at Hamilton College, Clinton, in the state of New York, in 1816, where he was engaged as tutor, and in pursuing his studies until 1821, when he went to Andover, Massachusetts, to superintend the printing of an edition of the first six books of the *Iliad*, previous to which he had married, and become a widower. He studied Hebrew with Professor Stuart at Andover, to whom he became an assistant professor. In 1826, he began four years' travel and study in Europe, where he married Miss Therese A. L. von Jakob, daughter of a professor at Halle. Returning in 1830 to Andover, he was appointed Extraordinary Professor of Sacred Literature, and librarian, but resigned in 1833, removed to Boston, and in 1837 was appointed Professor of Biblical Literature in the Union Theological Seminary, city of New York. At this period, he made, in company with Rev. Eli Smith, an extensive survey of Palestine, of which he gave an account in his admirable work, entitled *Biblical Researches in Palestine and Adjacent Countries* (3 vols. 8vo, Halle, London, and Boston, 1841)—which will always remain a standard work on the subject. He entered upon the active duties of his professorship in 1840; and in 1852 made a second visit to Palestine, of which he published an account in 1856. His other works are a translation of Buttman's *Greek Grammar*, 1832 and 1850; *Greek and English Lexicon of the New Testament*, 1836 and 1850; *Harmony of the Four Gospels*, in Greek, 1845, and in English, 1846. He was also editor of the *Biblical Repository*, *Bibliotheca Sacra*, Calmet's *Bible Dictionary*, a translation of Gesenius's *Hebrew Lexicon*, &c., and was an active member of geographical, oriental, and ethnological societies. He died in 1864.

ROBINSON, MRS. THERESA ALBERTINE LOUISE, wife of the preceding, and daughter of Professor von Jakob, known to the world of letters as 'Talvi,' a name composed of her initials, was born at Halle, Germany, January 26, 1797. In 1807, she accompanied her father to Russia, where he had an appointment as professor in the university of Kharhov. In 1810 they removed to St. Petersburg, where she learned modern languages and history. In 1816, they returned to Halle, and there she studied Latin, and wrote a volume of tales, published in 1825 under the title of *Psyche*; and under the signature of 'Ernest Berthold,' translations of Sir Walter Scott's *Black Dwarf* and *Old Mortality*, and also two volumes of Servian popular songs—*Volkslieder der Serben*. In 1828, she was married to Professor Robinson, and in 1830 accompanied him to America, where she studied the languages of the aborigines, translated Pickering's *Indian Tongues* into German, and contributed a *Historical View of the Languages and Literature of the Slavic Nations* to the *Biblical Repository*. In 1837, she accompanied her husband back to Germany, and published *An Essay on the Historical Characteristics of the Popular Songs of the German Nations*, *The Poems of Ossian not Genuine*, a *History of Captain John Smith*, in German, also *The Colonization of New England*, which was translated into English by the younger Hazlitt. Returning to New York, she wrote in English, *Heloise, or the Unrevealed Secret*; *Life's Discipline*, a *Tale of the Annals of Hungary*; *The Exiles*; and numerous contributions to German and American periodicals. She died at Hamburg in 1870.

ROBINSON, JOHN, a celebrated Scotch natural philosopher, was born at Boggall, in the parish of Baldernock, Stirlingshire, in 1739, and after a preliminary training at the grammar-school of Glasgow, entered the university of that city in November 1750, and took his degree in 1756. He was engaged to accompany Edward, Duke of York, to sea, as his instructor in mathematics and navigation; but this arrangement being abandoned, R. accompanied in a similar capacity the son of Admiral Knowles (1758—1762). He afterwards obtained the responsible office of

taking charge of the Harrison (q. v.) chronometer in its trial trip across the Atlantic; and on his return (April 1763) from this expedition, for which he was never remunerated, he returned to Glasgow to commence the curriculum of divinity study. He happened, however, at this time to renew his acquaintance with James Watt and Dr. Black, and his former strong predilection for physical science underwent a vigorous revival, and was cultivated with such success that in 1766, when Black was transferred to the university of Edinburgh, R. succeeded him. In 1770, his old friend, Admiral Knowles, having been recommended by the British government to the czarina Catherine II. as the fittest person to reform the ship-building and naval administration of Russia, accepted the appointment of President of the Russian Board of Admiralty, and persuaded R. to accompany him as secretary. R. remained in Russia for several years, and rose high in the opinion of government, which conferred upon him various offices, both honorable and profitable. But the chair of Natural Philosophy in Edinburgh having become vacant in 1773, R. was unanimously elected, and despite the extremely tempting and flattering offers of the Russian government, he accepted the chair (1774). On leaving Russia a pension was settled on him, and he agreed to take charge of two or three of the young cadets, his former pupils.

To the performance of his professorial duties, R. brought talents and acquirements of a high order; his knowledge was extensive, and included the latest discoveries of both British and foreign philosophers; his language was precise and fluent; and his views of his subject ingenious and comprehensive. But, on the other hand, his diction was too rapid, and he unfortunately disapproved of experiments, and employed them as little as possible in illustrating the great principles of natural science. In 1783, R. joined with Principal Robertson and other eminent men in reviving the old literary and scientific society (which had been founded in 1739 under the direction of Mr. Maclaurin, and had been in a languishing state since 1756), which was now incorporated by royal charter, and became the Philosophical Society. The *Transactions* of this Society contain several works from R.'s pen, which are held in high esteem; and his contributions to the *Encyclopædia Britannica* were the means of elevating that work to the rank of a valuable and trustworthy book of reference. He published Black's *Lectures on Chemistry* (1803), and also a portion of a work of his own, entitled *Elements of Mechanical Philosophy*, which, together with some MSS. intended to form part of a second volume, &c., was re-published by Sir David Brewster in 4 vols. (1822), with notes. On January 28, 1805, he was seized with a severe recurrence of a former illness, brought on by a cold, and died two days afterwards.

ROB ROY, the popular name of ROBERT M'GREGOR, a celebrated Scottish outlaw, whose singular adventures entitle him to be considered the Robin Hood of Scotland. He was born between the years 1657 and 1660, and was the second son of Donald M'Gregor of Glengyle, by a daughter of Campbell of Glenlyon. R. R., in consequence of the outlawry, in 1660, of the clan M'Gregor by the Scottish parliament, assumed the name of Campbell. In Gaelic, the name *Roy* signifies *red*, and was applied to him from his ruddy complexion and color of hair. R. R. received a fair education, and in his youth was distinguished for his skill in the use of the broadsword, in which the uncommon length of his arms was of much advantage. It was said that he could, without stooping, tie the garters of his Highland hose, which are placed two inches below the knee. Like many of the Highland proprietors of the period, R. R. dealt in grazing and rearing black-cattle for the English market. He took a tract of land for this purpose in Balquidder; but his herds were so often stolen by banditti from Inverness, Ross, and Sutherland, that, to protect himself, he had to maintain a party of armed men, to which may be attributed the warlike habits he afterwards acquired. He also protected his neighbors' flocks, in return for which he levied a tax, which went under the name of 'black mail.' R. R. married a daughter of the laird of Glenfalloch, shortly after which he acquired the estates of Craig Royston and Inversnadd, near the head of Loch Lomond. In consequence of losses incurred in unsuccessful speculations in cattle, for which he had borrowed money from the Duke of Montrose, R. R. lost his estates, which were seized by the duke, on account of this debt. R. R. rendered desperate by his misfortunes, collected a band of about twenty followers, and made open war upon the duke, sweeping away the whole cattle of a district, and intercepting the rents of his tenants. That this could happen at so late a period, and in the immediate neighborhood of the garrisons of Stirling, Dumbarton, and Glasgow, appears almost incredible; but R. R. enjoyed the protection of the Duke of Argyll and the respect of the country people, who gave him timely information of the designs of his enemies.

Numberless stories are still current in the neighborhood of Loch Lomond and Loch Katrine of his hairbreadth escapes from

capture by the troops. At one time, a reward of £1000 was offered for his head, in consequence of which he was obliged to take shelter in a cave at the base of Ben Lomond, on the banks of the lake, which had in former times afforded a secure retreat to Robert the Bruce. Many instances have also been recorded of his kindness to the poor, whose wants he often supplied at the expense of the rich. R. R. was not the commonplace *cateran* that many people think him. He gave his sons a good education, and died peaceably in his bed about the year 1788. His funeral was attended by all the people of the district, with the exception of the partisans of his enemy, the Duke of Montrose. R. R.'s exploits have been immortalized by Sir Walter Scott in his celebrated novel of *Rob Roy*, written in 1817.

An interesting fact is, that in the list of subscribers to Keith's *History of the Affairs of Church and State in Scotland*, published in 1784, there occurs the name 'Robert Macgregor, alias Rob Roy.' See Macleay's *Rob Roy and the Clan Macgregor* (1881).

ROC or ROCK, a fabulous bird, represented as of immense size, and 'able to truss an elephant' in its talons. It is perhaps enough to refer to the *Arabian Nights' Entertainments*, as to the size and power of the Roc. A belief in its existence prevailed throughout the middle ages, and it is noticed in many works of that period. The fables concerning the R. may have originated in exaggerated stories of some of the great eagles, or of the Lammergeier.

RO'CAMBOLE (*Allium scorodoprasum*), a plant of the same genus with garlic, onion, leek, &c., and nearly allied to garlic, which it resembles in its habit, although larger in all its parts. The upper part of the stem is in general spirally twisted before flowering. The root forms rounder cloves than those of garlic, and of much milder flavor; the umbels are also bulbiferous. R. has long been cultivated in kitchen-gardens, although it has never become very common in them. It is a native of sandy soils in Denmark and other countries near the Baltic.

ROCC'LLA. See ARCHIL.

ROCH or ROCK ALUM, a name formerly given to pure alum in mass; but it is now applied to a particular variety found at Civita Vecchia, in the Roman States. It is a kind of native alum, free from iron, but having a reddish color, derived from the soil in which it is found. It is also called Roman, and red alum. A factitious kind is now in general use, made of common alum reddened with Armenian bole.

RO'CHDALE, a thriving manufacturing town of Lancashire, a market-town and parliamentary and municipal borough, in the valley of the Roche, and built on both sides of that stream, 11 miles north-north-east of Manchester, and 200 miles north-west of London by railway. The parish church, placed on an eminence, and approached by a flight of steps, is a venerable edifice, dating from the 12th c., and built partly in late Norman, and partly in Perpendicular. The other public buildings comprise churches, chapels, and meeting-houses for the various dissenting sects. The new Town Hall, completed in 1867, is a fine building in domestic Gothic style. The public baths, opened in 1868, are the property of the corporation. Many improvements in the architectural and sanitary condition of the town have been made within recent years. With all the improvements, however, R. is beautiful only in site, and derives its importance wholly from its extensive and varied manufactures. The woollen manufacture, introduced here by a colony of Flemings in the reign of Edward III., is in a prosperous state, and is increasing in importance. Blankets, baizes, kerseys, and other woollen fabrics are the staple manufactures. Cotton goods also, especially calicoes, are largely manufactured. In the vicinity, coal is found, and flagstones, freestones, and slates are abundantly quarried. A good general trade is carried on; there are several hat-factories, cotton-mills, machine-shops, iron and brass foundries, &c. There are weekly markets for woollen goods and grain, and fortnightly fairs for cattle. The commerce of the town is facilitated by abundant means of communication. Pop. (1871) of municipal borough, 44,559; (1881) 68,865. R. returns one member to the House of Commons.

ROCHEFORT-SUR-MER, an important seaport and naval arsenal of France, in the dep. of Charente-Inférieure, stands on the right bank of the Charente, 5 miles from its mouth. It is surrounded by ramparts, and protected by forts at the mouth of the river; and is a modern, clean, well-built town. Few French towns can be compared with R. for the number and importance of its public works. The harbor, which is one of the three largest in France, is deep enough to float large vessels at low water. R. has fine wharfs, extensive magazines, dock-yards, rope-walks, cannon foundries, and other establishments designed for the manufacture and preservation of naval stores and marine apparatus of every kind, including extensive bread and biscuit stores. The most celebrated of its many institutions are the marine hospital, founded in 1787, and provided with 1240 beds for seamen, besides wards for invalided officers; the artillery and naval schools

for every branch of the profession, and the general civil college. Its convict-prison, which had accommodation for 1000 prisoners, has been disused since 1852, and the convicts are now transported to Cayenne. In addition to the extensive trade arising from the special character of the place, R. is the center of the commerce of the department, and is largely engaged in colonial trade, in the manufacture of brandy, and in the building men-of-war and of merchant-ships, steamers, and coasting-vessels. Pop. (1876) 25,454.

ROCHEFOUCAULD. See LAROCHEFOUCAULD.

ROCHELLE, LA, a fortified seaport of France, capital of the dep. of Charente-Inférieure, on an inlet of the Bay of Biscay, formed by the islands Ré and Oleron, 300 miles south-west of Paris by railway. Its little harbor, which consists of an outer tidal basin, and an inner wet dock, is surrounded by fine quays and commodious docks, close to which lie the principal streets and squares. Many of the latter are regular and well built, and present a handsome appearance from the number of houses which are adorned with porticoes and balconies. The public buildings most worthy of notice are the arsenal, the palace, the town-hall, the exchange, and the cathedral. Besides the fine promenade of the Place du Château, there are, outside the city walls, two extensive public gardens, known as La Promenade du Mail and the Champs de Mars. Ship-building is actively carried on, especially in connection with the Newfoundland fishing trade; and besides this branch of industry, and the manufacture of coal bricks and cotton yarns, R. has numerous glassworks, sugar-refineries, and distilleries for the preparation of brandy. Pop. (1876) 19,080.—R., which was known till the 12th c. under its Latin name of *Rupella*, or Little Rock, of which its present name is a mere translation, originated in a colony of serfs of Lower Poitou, who, fleeing from the persecution of their lord, settled on the rocky promontory between the ocean and the neighboring marshes, which had previously been occupied by fishermen only, but which rapidly increased in importance under the new settlers. On the marriage of Eleanor of Aquitaine with Henry II. of England, R., as a part of her dowry, came into the possession of the English kings, by whom it was retained till 1224, when it was taken by the troops of the French king, Louis VIII.; and although it was ceded to England at the treaty of Breigny in 1360, in the subsequent wars it was retaken by France, under whose sway it has remained since 1372. As a stronghold of the Huguenot party, it underwent various attacks and sieges during the religious wars of the Henries, in the latter half of the 16th c.; and on its final and unconditional surrender to the royal troops in the time of Louis XIII., its old fortifications were destroyed, and new lines of defences subsequently erected by the great Vauban.

ROCHELLE SALT is the popular name of the tartrate of soda and potash ($\text{NaO.KO, C}_2\text{H}_3\text{O}_6 + 8 \text{ A}$), this salt having been discovered, in 1672, by a Rochelle apothecary named Seignette. It occurs, when pure, in colorless transparent prisms, generally eight-sided; and in taste it resembles common salt. It is prepared by neutralizing acid tartrate of potash (formerly known as bitartrate) with carbonate of soda. After a neutral solution has been obtained, it must be boiled and filtered, and the resulting fluid must be concentrated till a pellicle forms on the surface, when it must be set aside to crystallize.

This salt is a mild and efficient laxative, and is less disagreeable to the taste than most of the saline purgatives. From half an ounce to an ounce, dissolved in eight or ten parts of water, forms an average dose. A drachm of Rochelle Salt added to one of the ingredients of an effervescent draught (bicarbonate of soda or tartaric acid, for example), forms one of the varieties of what are called Seidlitz powders.

RO'CHESTER, an episcopal city, parliamentary and municipal borough, and river-port of Kent, stands between Chatham (q. v.) on the east, and Strood on the north-west, on the right bank of the Medway, 36 miles east-south-east of London, by the London, Chatham, and Dover Railway. Together with Chatham and Strood, it forms in effect one large town. The city is surrounded on two sides by the river; and its ancient castle and cathedral, the numerous martello towers along its shores, and the works connected with the Chatham lines of fortification, render its appearance highly striking. The bishopric of R. was founded in 604; but the early Saxon cathedral suffered from the ravages of the Danes, and was in a completely ruined condition at the time of the Norman Conquest. Gundulf, who was consecrated Bishop of R. in 1077, began to rebuild the cathedral and the priory connected with it; the dormitory, chapter-house, and refectory were added under the succeeding bishop; and the new cathedral was dedicated in 1180, in presence of the king and a great company of bishops. The cathedral, the nave and crypt of which are Norman, and the choir and transepts Early English, is 310 feet long, and the western transept is 123 feet, and the nave and choir 68 feet broad.

Of the ancient Norman Priory, only a small fragment remains.

The castle, crowning an eminence, and overlooking the cathedral, is a Norman keep, built in a wonderfully strong and solid style of masonry. R. imports coal and exports hops. In 1880, 4463 vessels, of 766,018 tons entered the port, and 4798, of 772,215 tons, cleared. R. returns two members to the House of Commons. Pop. (1871) 18,352; (1881) 21,590.

R., which is surmised to have existed prior to the Roman invasion, was called by the Romans *Durobrivæ*, and according to Bede, derives its present name (*Hrof's-ceaster*, Hrof's Castle) from that of Hrof, a Saxon chieftain.

ROCHESTER, a city of New York, U. S., is on the Genesee River, 7 miles south of its entrance into Lake Ontario, where it is crossed by the Erie Canal and the Central Railway, and is the terminus of the Genesee Valley Canal and Railway, 229 miles west-north-west of Albany. In the center of the city are the upper falls of the Genesee, a perpendicular cataract of 96 feet. Two other falls of 84 and 25 feet are a mile and a half below, the river running through a deep gorge in its limestone banks, from 100 to 220 feet high. The city is well-built, chiefly of bluish limestone, with broad shaded streets, and there are nearly as many houses as families. The falls give water-power to numerous large flour-mills and other manufactories. The canal crosses the river on a handsome aqueduct of seven arches. There are 57 churches, 26 public schools, 41 academies, a university, theological seminary, atheneum, Protestant and Catholic hospitals, a reformatory and county offices, 5 banks and 4 savings banks with 10,000,000 dollars on deposit, 4 daily and 10 other papers. The rural cemetery of Mount Hope is one of the ornaments of the city. The suburbs are highly cultivated, having 4000 acres of fruit trees, and nurseries of 250 to 500 acres. The nursery trade of R. is not surpassed by that of any other place in the world. There is a good harbor at the mouth of the river, and a considerable commerce by the lake. R. was settled in 1810; in 1820, its population was 1502; in 1840, 20,191; in 1860, 48,248; in 1870, 62,386; in 1880, 89,363.

ROCHESTER, JOHN WILMOT, second EARL OF, has left a name notorious for wit and profligacy. He was born April 10, 1647, at Ditchley, Oxfordshire, his father being Henry, first earl, better known as the Lord Wilmot of Clarendon's *History*. He was entered of Wadham College, Oxford, when only 12 years of age; and at 14 was, with other persons of rank, made M.A. by Lord Clarendon in person. After traveling in France and Italy, he attached himself to the court, and rose high in favor with Charles II., who made him one of the gentlemen of the bed-chamber, and comptroller of Woodstock Park. In 1665, he went to sea in the fleet commanded by the Earl of Sandwich, and behaved at Bergen with great intrepidity. His account of the attack is described in a letter to his mother given in Wordsworth's *Ecclesiastical Biography*. He had entered into a formal engagement with his friend Mr. Windham, 'not without the ceremonies of religion, that if either of them died, he should appear, and give the other notice of the future state, if there was any.' Windham was killed in the action, but did not afterwards disturb the repose of his friend. R. incurred the displeasure of the king, and was committed to the Tower, for the forcible abduction of a celebrated beauty and heiress, Miss Mallett, who was rescued by her friends, but whom he subsequently married before he was 20 years old. His wit and love of pleasure made him the favorite of a dissolute court. He once harangued the populace as a mountebank from a stage on Tower Hill, and is said to have occasionally persuaded the 'merry monarch' to disguise his rank, and accompany him in the pursuit of frolic and adventure. His genius and activity of mind led him to withdraw at times from scenes of gallantry and licentious merriment. He cultivated the Muses with success, and Anthony Wood speaks of him as the greatest scholar among the nobility of his day. As he grew older, he gave less of his time to study, and more to the company of vicious companions, and indulgence in wine. His constitution being undermined by excess and voluptuousness, he died at the early age of 34.

Bishop Burnet has left an interesting account of his death under the title of *Some Passages of the Life and Death of John Earl of Rochester*, from which it appears that he became a sincere convert to the truth of Christianity, and sincerely repented his immoral and dissolute courses. He wrote some love-songs, an elegant *Imitation of Horace on Lucilius*, a *Satire against Man*, in which he is much indebted to Boileau, and an *Essay on Nothing*, which is perhaps his best performance.

ROCHET (Lat. *rochetus*, or *rochetus*), a portion of the church costume of bishops, abbots, prelates, canons of certain privileged chapters, and some other dignitaries. It is usually of lawn or lace, and is of the form of a surplice, but with close-fitting sleeves. In the Latin Church, its use is very ancient, although its form has varied at different times. In the first Prayer-book of Edward VI., which preserved a considerable part of the Roman episcopal costume, the rochet was ordered to be worn by bishops in the com-

munion service. The rochet, however, must not be confounded, as is often done by writers on clerical costume, with the Dalmatic and Tunic, tight and close-fitting vestments of colored silk worn by bishops under the *Planeta* (q. v.).

ROCK. Though popularly restricted to masses of indurated matter, this term is extended by geologists to all substances which make up the crust of the earth, whether they be loose and friable like soil and sand, or compact and indurated like limestone and granite. The rocks of the earth's crust will be found described under the heads AQUEOUS and IGNEOUS ROCKS, to which the reader is referred.

ROCK, a kind of sweetmeat, made of sugar, sometimes mixed with almonds and various flavoring materials. The sugar is first boiled and then poured out upon a cold marble slab, and worked up into a rough mass.—The term is also frequently applied to another form of sweetmeat, in which the sugar, whilst hot and soft, is pulled repeatedly over a smooth iron hook, until it becomes white and porous. This is also flavored with peppermint or other essences.

ROCK, COCK OF THE (*Rupicola aurantia*), a bird of the order *Insessores*; tribe *Dentirostres*; family *Pipridæ* (Manakins, &c.), regarded by many as a sub-family of *Ampelidæ*. The *Pipridæ*, or Manakins, are a pretty large group of birds, many of them of very curious and beautiful plumage, most of them inhabitants of America, and only of the tropical parts of it. They have the bill broad at the base, the nostrils at the side nearly hidden by feathers; the wings rather short, but pointed; the tail very short and even; the legs (*tarsi*) long and slender. In the genus *Rupicola*, the bill is strong; and the species sometimes called *Rock-manakins* are comparatively large birds, having a double vertical crest on

Cock of the Rock (*Rupicola aurantia*).

the head, with the feathers disposed in a fan-like manner. The Cock of the R. is a native of Guiana and of other north-eastern parts of South America. It is remarkable for its bright orange-colored plumage—the quill-feathers of the wings, however, being black, and the tail tipped with yellow—its large crest overhanging the bill; and its wary habits. It is a solitary bird, inhabiting rocky places, retiring into a hiding-place during the day, and coming forth to feed at sunrise and sunset. The tips of the crest-feathers are tinged with brown and yellow. The wing-coverts and upper tail-coverts are loose flowing plumes, giving a resemblance to gallinaceous birds. The size is about that of a common pigeon.—The Peruvian Cock of the R. (*R. Peruviana*) is less brilliant in plumage than the Guiana species.

ROCKALL stands on a sandbank in the North Atlantic Ocean; this bank is nearly 100 miles in length, and 40 in breadth. The rock itself is situate in 57° 35' N. lat., 13° 40' W. long., about 300 miles west of North Uist, in the Outer Hebrides, and is of a rounded form, rising about 18 or 20 feet above the sea. It is frequented by large flocks of sea-birds, and the place was found some years ago to be surrounded by considerable shoals of the larger kinds of fish, chiefly *Gadidæ* and *Pluronectidæ*. A company was formed in 1861 to carry on a fishery at the place; but the supply not proving so great as was anticipated, and the distance from the markets being very considerable, the speculation proved to be very unprofitable. There are still a few fish about R., but they are caught by private fishermen.

ROCK BUTTER, a mineral substance, consisting of Alum (q. v.), mixed with alumina and oxide of iron, of a pasty consistency, and appearing as an exudation oozing out of rocks which contain alum. It is always greasy to the touch, but is often hard enough to exhibit a straight foliated fracture. It is very easily broken. It occurs in most of the places where alum is procured.

ROCK CRYSTAL, a popular and partly also a scientific name for the finest and purest Quartz (q. v.) seldom applied, however, to small crystals which are mere six-sided pyramids, but more generally to those in which the six-sided prism is well developed. The name is sometimes limited to colorless and perfectly transparent quartz, but is also more rarely extended to that which is violet or amethystine (*Amethyst*, q. v.), red (*Bohemian Ruby* or *Silesian Ruby*), wine-yellow (*Citrine* or *Gold Topaz*), brown or smoky (*Smoke Quartz*, *Cairngorm Stone*), &c. The beauty of specimens of R. C. is sometimes very great. The crystals are sometimes slender, crossing and penetrating each other in exquisite groups. They sometimes enclose other substances, which are beautifully seen through the transparent R. C., as slender hair-like or needle-like crystals of hornblende, asbestos, oxide of iron, rutile or oxide of titanium, oxide of manganese, &c., and such specimens are known by various fanciful names, as *Thetis's Hair-stone*, *Venus's Hair-stone*, *Venus's Pencils*, *Cupid's Net*, *Cupid's Arrows*, &c.; and sometimes the enclosed substances are small spangles of iron-glance, or crystals of iron pyrites, or native silver in fern-like leaves, or spangles of gold.

Very large crystals of perfectly pure R. C. are sometimes found. One found in the Alps, and which was among the treasures carried from Italy by the French in 1797, is 3 feet in diameter, and weighs 8 cwt. R. C. was prized by the ancients, and was used by them, as it still is, for vases, cups, seals, &c. An important modern use of it is for lenses of spectacles, &c., its hardness rendering it much less liable to be scratched than glass. Lenses of R. C. are often called *Pebble lenses*.

ROCKET, a name given to a number of plants of the natural order *Cruciferae*, and belonging to the genera *Brassica*, *Sisymbrium*, *Erysimum*, *Barbarea*, *Hesperis*, &c.—**GARDEN R.** (*Brassica Eruca*, or *Eruca sativa*) is an annual plant, a native of Austria, with stem two feet high, upright and branching; the leaves smooth, succulent, cut and toothed. When in flower, it has a strong, peculiar, and disagreeable smell; but when it is very young, this smell is almost imperceptible, and the leaves are used as a salad, for which it is frequently sown on the continent of Europe, and was formerly cultivated also in Britain.—The name **GARDEN R.** is also given to *Hesperis matronalis*, also called *Dame's Violet* (q. v.), a favorite ornament of our flower-borders.—The **YELLOW R.** of our flower-borders is a double-flowered variety of *Barbarea vulgaris* (see **CREST**).—The **WILD R.** (*Sisymbrium officinale*, or *Erysimum officinale*) is common in Britain, and is sometimes sown and used as a spring pot-herb.

ROCKET is a firearm capable of taking effect at a long range. The Rocket consists of a light tubular case of pasteboard, or thin metal, charged to the muzzle with a composition consisting of saltpetre 68 parts, sulphur 12 parts, charcoal, or meal powder, 32 parts. This composition is rammed hard into the case, the center being left void. To the rocket is attached a long stick, which serves (like the tail of a kite) to straighten its course. See **PYROTECHNY**. When lighted at the end the stream of gases propels the mass on the principle explained under **BARKER'S MILL**. As a mere firework, rockets are made of a few ounces in weight: as intended to throw light upon a town or a hostile work, they average from $\frac{1}{2}$ lb. to 2 lb. These light rockets were improved by Sir William Congreve, who so contrived them, that, when over the necessary point, the rocket discharged a number of light balls, which burned in the air for several minutes with great brilliancy, while others at the same point released small parachutes, which sustained a bright light for a still longer time. But Sir William Congreve did more: he converted the rocket into a terrible weapon of war, with ranges which no ordnance of that day could attain. Discarding the small sizes, he made 12-lb., 18-lb., and 32-lb. rockets, which he charged with canister-shot, bullets, and other missiles.

The stick for a 32-lb. rocket is 18 feet in length, and the maximum range 3500 yards. The range can be also increased by discharging the rocket from a cannon, with a time-fuse to ignite it at the cannon's utmost range, when the rocket commences its own course. As missiles, these rockets are found to annoy most seriously the defenders in any fortified work, and, in a bombardment, they speedily set houses and buildings on fire. In the field, also, the plunging, ricochetting motion of the rocket greatly disturbs both cavalry and infantry. The Congreve rockets were first tried on actual service, and with fatal effect, at the attack on Copenhagen in 1807. One great advantage in a rocket is, that it has no recoil against the stand from which it is fired; the largest rocket may therefore be discharged without danger from the smallest boat; consequently, in naval attacks on maritime fortresses, a flotilla of rocket-boats is a very common auxiliary. For the use of rockets in shipwrecks, see **LIFE MORTARS** AND **ROCKETS**.

ROCK-FISH. See **WRASSE**.

ROCKFORD, a city of Illinois, U.S., on the Rock River, 92 m. W.-N.-W. of Chicago, on the Chicago and Galena Railway.

It is the center of a rich country, with county buildings, 6 banks, 5 newspapers, 16 churches, and factories supplied with water-power by the river. Pop. in 1880, 13,136.

ROCKING-STONES, or **LOGGANS**, are large masses of rock so finely poised as to move backwards and forwards with the slightest impulse. They occur in nearly every country. Some of them appear to be natural, others artificial; the latter seem to have been formed by cutting away a mass of rock round the center-point of its base. The former are chiefly granitic rocks, in which felspar and porphyry are abundantly present; and these ingredients becoming rapidly decomposed, and the dust and sand washed away by rains, what was formerly a solid rock soon assumes the appearance of a group of irregularly-shaped pillars, having a rhomboidal horizontal section, and separated into portions by horizontal and vertical fissures. As decay proceeds, the edges of the blocks forming the pillar are first attacked and disappear, as is also the case with greenstone and basalt, and the pillar now becomes a pile of two or more spheroidal rocks, resting one upon the other (see fig., where A, B, and C exhibit three successive stages in the process of decomposition, as observed by De Luc in the mountains of Silesia).

Should a mass of rock be so situated as to preserve its equilibrium in spite of the gradual diminution of its base or point of support, a rocking-stone or loggan is the result. For an exposition of the principle regulating the stability of equilibrium of rocking-stones, see **STABILITY**. Various explanations have been given of the uses of these singular objects. They are supposed to have been used in very early times for purposes of divination, the number of vibrations determining the oracle; hence it came to be believed that sanctity was acquired by walking round them.

Some rocking-stones occur near to remains of ancient fortifications, which seems to bear out a statement in one of the poems of

Rocking Stone.

Ossian, that the bards walked round the stone singing, and made it move as an oracle of the fate of battle. In Greece, rocking-stones occur as funeral monuments, and are generally found on conspicuous places near the sea. Rocking-stones are numerous in Yorkshire, Derbyshire, Cornwall, and Wales. One near Land's End, in Cornwall, has been computed to weigh no less than 90 tons. Near Warton Crag, Lancashire, are no less than seven of these stones. In Scotland, they occur in the parishes of Kirk-michael, Dron, and Abernethy, Perthshire, and in the parish of Kells, Kircudbrightshire. In Ireland, they are found in many places; one situated at a place called Islandmagee, on Brown's Bay, is popularly believed to acquire a rocking tremulous motion at the approach of sinners and malefactors.

ROCK ISLAND, a city of Illinois, at the foot of the upper rapids on the Mississippi, opposite Davenport, Iowa, 3 miles above the mouth of Rock River, 181 miles west-by-south of Chicago. The Mississippi is here crossed by a railway bridge, and the island from which the town is named has been selected as the site of a national armory. A dam across a portion of the river gives water-power for many manufactures. Pop. (1880), 11,660.

ROCKLAND LAKE, a beautiful sheet of water in Rockland County, New York, U.S., 30 miles north of New York City, 1 mile from the Hudson, and 160 feet above its surface. It is celebrated for furnishing 200,000 tons of pure ice, annually harvested by about 1000 men, for the supply of New York, and for export.

ROCKLAND, a town in Maine, U.S., on the west side of Penobscot Bay, 40 miles south-east of Augusta. It has a broad and deep harbor, and 80 lime-kilns, making 1,200,000 casks of lime yearly, chiefly shipped to Boston and New York. Its commerce employs 18 ships, 40 barks and brigs, and 150 schooners. It has 3 banks, 2 newspapers, 8 churches, &c. Pop. in 1860, 7316; in 1870, 7074.

ROCKLING (*Motella*), a genus of fishes of the Cod and Haddock family (*Gadidae*), having an elongated body, compressed towards the tail; the first dorsal fin very slightly elevated, and very delicate; the second dorsal and the anal fins long, continued almost to the tail fin. Several species are found on the British coasts, and are distinguished among other things by the number of their barbeles, three, four, or five. The largest of them is

never more than 19 or 20 inches long; the smallest, the MACKAREL MIDGE (*M. glauca*), only about an inch and a quarter. None of the species is much regarded by fishermen, one reason being, that decomposition takes place very rapidly after they are

Three-bearded Rockling or Sea Loach (*Motella tricirrata*).

taken out of the water, although, when quite fresh, they are not bad for the table.

ROCK-OIL. See NAPHTHA.

ROCK RIVER rises in the south-eastern portion of Wisconsin, U.S., and runs south-west into Illinois, thence south-west, and empties itself into the Mississippi 8 miles below Rock Island. Its course of 200 miles is through one of the most beautiful and fertile regions in the world, known as the 'Rock River Country.' Its frequent falls give abundant water-power, and it is crossed by 12 lines of railway.

ROCK-ROSE. See CISTUS.

ROCK-SALT is common salt (chloride of sodium) occurring as a mineral and in a solid form. It is always mixed with various impurities. It is found massive or crystallized, its crystals generally cubes, its masses very often either granular or fibrous. It is white, gray, or, owing to the presence of impurities, more rarely red, violet, blue, or, striped. For its chemical and other qualities, see SALT. It is a very extensively-diffused mineral, and in some places forms great rock and even mountain masses. A hill of rock-salt near Montserrat, in Spain, is 500 feet high. The island of Ormuz, in the Persian Gulf, is formed of rock-salt. The Indus, in the upper part of its course, forces its way through hills of rock-salt, rising in cliffs 100 feet above the river. In many parts of the world, rock-salt is found in beds under the soil or other rocks. Those of Cheshire in England are particularly celebrated, as at present yielding almost all the salt used in Britain, great part of which is pumped from them in the form of brine. Part is also obtained by mining, as at Northwich. The mines of Wieliczka, in Poland, are of great extent. The workings are at depths varying from 200 to 740 feet, and the salt at the deepest working is the purest. Some of the chambers in the mines are said to be 300 feet high. Blasting by gun-powder is often necessary in the mining operations. The mines give employment to 1200 or 1400 workmen; and they have been wrought for centuries. Vast quantities of rock-salt occur in many parts of Asia, Africa, and America. In Caramania and Arabia, rock-salt is sometimes used for building houses, the dryness of the climate rendering its solubility unimportant.—The salt which crystallizes on the margins and bottoms of salt lakes may be regarded as a variety of rock-salt. Concerning the salt of the ocean, the salt found in many desert regions as an efflorescence on the ground or on rocks, the salt with which sandstone and other rocks are impregnated, &c., see SALT.

ROCK-SOAP, a mineral consisting of silica, alumina, peroxide of iron, and water, the silica nearly one-half, the alumina and the water sometimes nearly each one-fourth of the whole. It is earthy, easily broken, black or nearly so, very soft, and easily cut with a knife, is greasy to the touch, and adheres strongly to the tongue. It is valued by painters for crayons. It is found in a number of places on the continent of Europe, and occurs in trap rocks in the Isle of Skye. It is only found massive.

ROCK-WORK, an ornamental structure often introduced into gardens, for the cultivation of plants such as grow on or amongst rocks. It is made of rough blocks of stone rudely piled together, with earth, &c. Simple as it seems, it is very difficult of construction; and too often, after much expense, it has a paltry and ridiculous appearance.

ROCKY MOUNTAINS, that portion of the great ranges of mountains in the central and western portions of North America which lies in the United States and British possessions, a continuation of the Cordilleras of Mexico, between the Pacific Ocean and 105° W. long., and reaching from Mexico to the Arctic Ocean. In the United States, the R. M. extend over a breadth of 1000 miles, and cover an area of 980,000 square miles. From lat. 32° to 40° N., the ranges bear nearly north and south; between lat. 40° and 45° N., their course is north-west; then, after a more northerly

bend, they keep a course nearly parallel to that of the Pacific, with many detached ranges and peaks, one of which, Mount Elias, lat. 61° N., long. 141° W., is 17,800 feet high, and marks the boundary-line of longitude between Alaska and the British possessions. Mount Shasta, in the coast-range in North California, is 14,000 feet high; Fremont's Peak, near the western boundary of Wyoming, and the sources of the Yellowstone and Colorado Rivers, is 13,570 feet. In British Columbia, Mount Brown, lat. 53°, is 16,000 feet; and Mount Hooker, 15,700 feet. The passes have elevations of 6000 to 7000 feet, and a vast territory is from 4000 to 5000 feet above the level of the sea.

The central range of the R. M. forms the ridge which divides the rivers that fall into the Pacific from those that fall into the Arctic Ocean, Hudson's Bay, and the Gulf of Mexico, and whose head-waters are often interlocked; but between the eastern and western ranges lie the territory of Utah and the state of Nevada, in which are large rivers having no other outlets than lakes, generally salt, as Great Salt Lake in Utah, and Humboldt's Lake, the outlet of Humboldt's River, in Nevada. The tops of the higher ranges are covered with perpetual snow, and their lower regions abound with artemesias, odoriferous plants, and sunflowers. The rocks are metamorphic gneiss, granites, porphyries, mica and talcose slates, and gold-bearing quartz, with deposits of mercury, silver, carboniferous limestone, coal, and petroleum. Anthracite has been found near the gold mines of Santa Fe, and copper in New Mexico.

ROCO'CO, a name given to the very debased style of architecture and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle

Rococo Ornament.

or taste. This style prevailed in Germany and Belgium during last century, and in France during the time of Henry IV. The fig. is an example from an altar in the church of St. James's, Antwerp.

ROCROI, a small town of France, in the dep. of Ardennes, 15 miles north-west of Mézières, is a fortress of the fourth class, and is situated in a fine extensive plain, bounded on all sides by the forest of Ardennes. Pop. (1876) 1052. It is memorable for the victory gained by the Great Condé (then Duke of Enguien) over the Spaniards, May 19, 1648. The Spanish army was composed of veteran bands of Walloons, Spaniards, and Italians; and their general, Don Francisco de Mellos, the governor of the Low Countries, was a commander worthy of his army. The French (22,000) were also good troops; but their general, Condé, was a young and inexperienced officer. At first, the battle was unfavorable to the French, but at last the Spaniards were thrown into irrefragable rout. The Count of Fuentes, the commander of the redoubtable infantry, and 10,000 of his men were among the slain; and 5000 men, with all the cannon, many standards, and the baton of the Count de Mellos, were captured. But far beyond all material losses, the renown of invincibility, first acquired by the Spanish infantry on the field of Pavia (1525), and confirmed at St. Quentin, Gravelines, and Prague, was destroyed.

ROD, called also a *pole*, or *linear perch*, a measure of length of 5½ yards, or 16½ feet. The square rod, called generally a *rood*, is employed in estimating masonry, and contains 16½ × 16½, or 272¼ square feet.

RODE'NTIA (Lat. Gnawers), or **RODENTS**, in the system of Cuvier, an order of mammalia, almost exactly corresponding with the *Gnires* of Linnæus. The order is a truly natural one, and is therefore universally recognized by naturalists. The R. are small quadrupeds; the largest of them—the Capybara—not being equal in size to a hog, whilst to this order belong the smallest of mammalia. They are very numerous, and widely distributed over the globe, particularly abundant in South America, and rarest in Australia. They are all remarkably characterized

by their front teeth, variously regarded as incisors and canines—the true incisors or canines being absent—which are large and of peculiar structure, two in each jaw, and separated by a considerable vacant interval from the molars.

The front teeth have a plate of hard enamel in front, which wears more slowly than the substance of the rest of the tooth, so that being employed on hard substances, they acquire a chisel-like form, and unlike the teeth of mammals in general, they are always growing from a fresh pulp at the base, so that compensation is made for the wearing away at the tips; but when a tooth is accidentally destroyed, the opposite tooth continuing to grow, sometimes acquires a monstrous shape and size, from which cause rats and other rodents have been known to die. The enormous tooth preventing the eating of food, or even recurring and piercing the skull. The ordinary food of most rodents consists of vegetable substances, and generally of a pretty hard kind, and their front teeth are adapted for comminuting it by gnawing, and

Skull of the Beaver, showing the Dentition.

are also used for gnawing wood, the shells of nuts, &c., in order to obtain access to food. The molar teeth have flat crowns, having ridges of enamel, which make them more or less tuberculous; and these are in the line of the jaw, whilst the only horizontal motion of which the lower jaw is capable is forwards and backwards, thus making the ridges of the molar teeth powerful instruments for the reduction of hard substances; the jaws also being in general very strong. In the rodents which eat only vegetable food, the molar teeth have rounded tubercles; whilst in the omnivorous kind—as rats—the tubercles become sharp points. The stomach is simple; the intestines are very long; the cæcum is often large, sometimes larger than the stomach itself. The brain is not large, and is nearly smooth, and without convolutions; the rodents are not generally distinguished for sagacity, although some of them—as the beaver—exhibit remarkable instincts. Most of them may be easily tamed, but few of them seem capable of learning anything, and in general they merely acquire a familiarity with man. Of this the rabbit exhibits a very perfect example, although the rat seems to display a far higher intelligence. The eyes are directed laterally.

The rodents very generally have the hinder limbs larger than the fore, and their motion is partly a kind of leaping. In some, this is as completely the case as in kangaroos. Some, as squirrels, have an admirable power of climbing trees; and a few, as beavers and water-voles, are aquatic. Most, if not all, have the habit of sitting on their haunches, and holding their food to their mouth by their fore-paws; using both paws together, however, as the fore-feet have not at all the character of a hand. The thumb is never opposable to the other toes; sometimes it is rudimentary or wanting. The bones of the fore-leg are generally separate, but have not so much freedom of motion as in the *Carnivora*. The toes are terminated by claws. The presence or absence of clavicles (collar-bones) divides the order into two sections, to the first of which, having clavicles, belong squirrels, mice, rats, voles, the beaver, &c.; and to the second, without clavicles, belong porcupines, cavies, chinchillas, hares, rabbits, &c. The rodents are very numerous, about 400 species being known.

RODERIC, the last king of the Visigoths in Spain, whose tragic downfall, coincident with that of the Visigothic monarchy, has inspired poets and romancers (including historians) to throw round him a halo of glory. The Spanish and Arab historians contradict each other in almost every particular of R.'s life—the latter, on the whole, being apparently the more trustworthy. According to them, R. was of humble birth, but rose, through his talent and bravery, to the command of the cavalry. A conspiracy having been formed against Witiza, the reigning monarch, by the clergy and the nobles of Roman blood, R. was elevated to the throne in 709, and by his energy and talent soon quelled all opposition. The sons of Witiza, however, joined with some discontented Visigothic nobles—among whom was Count Julian—and agreed to summon to their assistance, the Arab chief, Muza ibn Nozeir, who had just finished the conquest of Mauritania. The Spanish writers, on the other hand, assert that the country groaned under the tyrannical government of R., that his licentious behavior had disgusted many of his nobles, and that the people were ripe for a revolution when the Moslem invasion took place. Both are agreed as to the time and mode of the invasion; but the

Arab historians brand Count Julian with the most atrocious treachery, as not only voluntarily surrendering Ceuta, the key of the country, but actually guiding the 13,000 Berbers and Arabs under Tarik into Spain.

A landing was effected at Algeiras, 28th April 711; and in spite of vigorous opposition from the governor of Andalusia, Tarik marched on, routing R.'s chosen cavalry, which had been sent to oppose him. R., who had been employed in another quarter, now hastened at the head of an army, which is variously estimated at from 50,000 to 100,000 men, to oppose the daring invaders, who by this time had been so reinforced from Africa and by rebels that their numbers amounted to 25,000. The two armies met on the banks of the Guadalete, near Xeres de la Frontera, and on July 17 the battle commenced. R. directed the center of his army in person, appointing the sons of Witiza to command the wings, and the battle raged furiously for three days; a single combat then took place between R. and Tarik—a kind of statement extremely frequent in Eastern histories—in which the former was slain, and his head cut off, to be embalmed, and sent to Muza. The Christians, enraged at the loss of their chief, fought furiously during six days longer, but all in vain, for victory now declared itself decisively in favor of the Moslems, to whom the sons of Witiza had deserted soon after the commencement of the contest, and the rout of R.'s army was complete. The most ancient Spanish chroniclers agree in asserting that R. either died on the field or sunk in the Guadalete, whilst attempting to save himself by swimming his horse across; and the various stories of his escape and subsequent adventures are of much later date. This decisive victory laid all Central and Southern Spain at the feet of the Arabs. R. has been made the hero of an epic poem by Southey.

RODEZ, a small town of France, capital of the dep. of Aveyron, stands on the crest and slope of a hill, on the north bank of the Aveyron. Its streets are steep, narrow, winding, and dirty; but the promenades around the town are pleasant. The cathedral, with a clock-tower of great height, is a Gothic structure of the 15th century. A variety of woollen cloths are manufactured, and cheese of a highly esteemed quality is made. Pop. (1876) 12,881.

RODIYAS, a degraded race in Ceylon, who are expelled from society, and live in a condition more abject than that of the Pariahs of India. By some they are thought to be a branch of the Veddahs (q. v.). Under British rule, which does not recognize caste, the R. have improved socially, and are no longer disqualified for labor. For many interesting particulars respecting this unfortunate race, see *Ceylon*, by Sir J. E. Tennent, vol. ii. p. 191.

RODNEY, GEORGE BRYDGES RODNEY, LORD, English admiral, born February 13, 1718, was second son of Captain Rodney of the Royal Marines. He was taken from Harrow School at the early age of twelve, and sent to sea. He became lieutenant in 1739; post-captain, 1742; and commander of the Newfoundland station in 1748, with the rank of commodore. In 1752, he returned home, and was elected M.P. for Saltash. He afterwards commanded the *Pouquevau*, the *Prince George*, and the *Dublin* men-of-war. In 1759, after 28 years' active service, he was made rear-admiral; and in July he bombarded Havre for two or three days, destroying the town and fortifications so effectually, that it has never recovered its former importance as an arsenal for ships-of-war. In 1761, he took Martinique, Grenada, and Santa Lucia. In 1762, he became vice-admiral, and in 1764 was made a baronet. In 1779, Spain joined France in the war against England, and their united fleets appeared in the Channel in overwhelming force. The siege of Gibraltar was undertaken by the Spaniards; and R., who was sent out with 22 sail of the line and 8 frigates to the West Indian station, was ordered to relieve Gibraltar *en route*. After capturing seven Spanish ships of war, he fell in, January 16, 1780, with Admiral Langara, off Cape St. Vincent, 'that promontory which has witnessed more of our battles and triumphs than any other headland in the world.' Of the Spanish fleet, five were captured, and two destroyed. Having accomplished the relief of Gibraltar and Minorca, he quitted the Mediterranean, and crossed the Atlantic to the station of his command. On the 17th April he defeated, near Martinique, the French fleet under the Count de Guichen. Being ill-supported by his captains on this occasion, he complained to the Admiralty.

The naval administration of the day was, however, so corrupt and rotten, that the Admiralty suppressed the criminatory passages of his dispatches, and only one of the accused was brought to trial, the others being allowed to escape from the difficulty of finding a sufficient number of non-delinquent officers to try them. R. took Eustatia from the Dutch, with 250 ships and other booty, estimated at three millions sterling. Demerara and Essequibo next surrendered. On the 12th April 1782, R., in conjunction with Hood and Drake, encountered the French fleet under De Grasse off Dominica, April 12, 1782. Each fleet consisted of upwards of 80 ships of the line. The battle was more obstinately contested than

any engagement that ever took place between the two nations, being kept up without intermission for nearly 12 hours. De Grasse was totally defeated, and R. lost seven ships of the line and two frigates. Owing to the French vessels being crowded with troops, they are said to have lost 8000 killed and 6000 wounded; while the English loss did not exceed 600. On board the *Ville de Paris* were 36 chests of money, to pay the soldiers; and the whole train of artillery was on board the other captured ships. Count de Grasse was himself taken prisoner. His flagship the *Ville de Paris*, of 112 guns, was the only first-rate man-of-war that up to that date, had ever been taken and carried into port; and De Grasse, when he landed at Portsmouth, was stated to be the first commander-in-chief of a French fleet or army who had been prisoner in England since the capture of Marshal Tallard in Queen Anne's wars. In this action, R. successfully executed the nautical manoeuvre of breaking the French line, and placing the enemy between two fires, which had fallen into disuse since the Commonwealth. R.'s victory saved Jamaica, ruined the naval power of France and Spain, and gave the finishing blow to the war. The news arrived in England just after an order had been despatched for the recall of R., whose politics differed from those of the new ministry. He was now elevated to the peerage as Baron Rodney, and received a pension of £2000 per annum for himself and his successors. He lived in retirement for the rest of his life. He died May 21, 1792.

RODOSTO, a town of Turkey, stands on the north shore of the Sea of Marmora, 77 miles west of Constantinople. It contains many mosques, and sends large quantities of fruits and vegetables to the capital of the empire. Pop. 18,000.

RODRIGUEZ, a rugged and hilly island, 330 miles E. by N. of Mauritius, of which it is a dependency, being one of the Mascarene group. The soil is fertile; turtles abound. The island is interesting to naturalists as having been the habitat of the now extinct bird, the Solitaire (q. v.). Area, about 60 sq. miles. Pop. 1500.

ROE (*Cervus capreolus*, or *Capreolus doreas*), a species of Deer (q. v.), inhabiting Europe and some parts of Asia, chiefly in hilly or mountainous regions, either covered with forests or with scattered bushes and heath. It is seldom found in the higher and more naked mountain tracts, the haunt of the stag or red deer. It was once plentiful in Wales and in the hilly parts of England, as well as in the south of Scotland, but is scarcely

Roebeck (*Cervus capreolus*).

now to be seen in any part of Britain south of Perthshire. It is not long since it was pretty common in some of the wilder parts of the north of England. The R. is about 2 feet 3 inches in height at the shoulder. Its weight is about 50 or 60 pounds. Its color is a shining tawny-brown in summer, more dull and grizzled in winter, the lower parts and part around the tail white. There is considerable variety in the shade of color. The hair is longer than in many deer. The tail is very short, concealed among the hair.

The horns, which are peculiar to the male (the *Roebeck*), are 8 or 9 inches long, erect, round, very rough, longitudinally furrowed; having in mature animals, two times or branches, which, as well as the tip of the horn, are sharp-pointed, so that the horns of the R. become very dangerous weapons when used for offence. The ears are large. The habits of the R. somewhat approach to those of the goat, or even of the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious, not more than a buck and doe with one or two fawns being usually seen together. Contrary to what is usual among deer, the male and female R. remain attached during life. The voice of the R. resembling that of a sheep, but shorter and more barking, is often heard through the night, in regions where it is plentiful. The browsing of the R. is very injurious to young woods, a circumstance which has led to its extirpation in places where it would otherwise have been

cherished. It feeds much on the tender shoots of trees and bushes as well as on herbage. The venison is superior to that of the stag, but not equal to that of the fallow-deer. The horns are used for handles of carving-knives, &c. The R. is never very thoroughly tamed, and when partially so, is apt to become mischievous, and the male dangerous.—Another species of R. (*Cervus* or *Capreolus pygargus*), rather larger than the common R., is found in Tartary.

ROEBUCK, JOHN ARTHUR, English politician, was born at Madras in 1801, but passed his youth in Canada. At the age of 23, he came to England, and was called to the bar at the Inner Temple in 1831. He challenged the suffrages of the electors of Bath as a Radical reformer in 1832, and represented that city until 1837. He was again elected in 1841, and held his seat until the general election (1847). In May 1849, he was returned for Sheffield, which he represented till 1868; and for which he was again returned in 1874. In 1835, when the executive government of Canada and the House of Assembly of Lower Canada were at variance, the latter body appointed R. their paid agent in England—a position which involved him in a serious quarrel with the press.

He was next the central figure of a parliamentary 'scene,' on the occasion of a too plentiful crop of election petitions and election compromises subsequent upon a general election. He made out such a case that, in defiance alike of Whigs and Tories, he obtained a committee to inquire into election compromises. His next great appearance was at the meeting of Parliament in January 1855, when he gave notice of a motion for inquiring into the condition of the army before Sebastopol. To the undisguised joy of the nation, R. carried his motion by an immense majority, and the administration of the Earl of Aberdeen was shattered to pieces. The Sebastopol Committee sat, and the inquiry exercised great influence in the subsequent reconstruction of the War Department, and the reorganization of our military, commissariat, and medical systems. In 1855, he became a candidate for the chairmanship of the Metropolitan Board of Works, with a salary of £1500 per annum, but was only third on the poll. On the annexation of Savoy and Nice in 1860, R. indulged in the sharpest invective against the Emperor Napoleon. He became a director of the Galway Steam-packet Company, and offended his constituents by defending a contract which they regarded as savoring of a political job. He went to Vienna to obtain some commercial concessions for a company with which he was connected, and returned with strong pro-Austrian sympathies, volunteering a defence of Austrian rule in Venetia, which jarred upon public feeling. During the civil war in America, he displayed a strong leaning towards the cause of the Confederates. In the debate on the war between Germany and Denmark, R. declared (1864) that the English fleet ought to have been sent to defend Denmark. He warmly supported the Earl of Beaconsfield's policy during the Eastern crisis in 1877-78, and in 1878 was made a member of the Privy Council. R. was fearless and unmeasured in attack, not too charitable in his judgments, fond of personalities, but regarded as an honest and true-hearted Englishman. He is the author of a work on the *Colonies of England*, the *History of the Whig Ministry* of 1830, and wrote much for the *Reviews*. He died 30th November 1879.

ROERMOND (Fr. Ruremonde, called also by old writers Godswaard [i. e., God's Island] op de Maas), an old but lively town in the Netherlands, province of Limburg, at the junction of the Roer and the Maas. A suburb called St. Jacob is connected with R. by a beautiful stone bridge over the Roer. The cathedral is one of the handsomest churches in the Netherlands. Pop. (1875) 9609, about 350 being Protestants, 100 Jews, the remainder Roman Catholics. Principal industries are weaving woollen cloths, cottons, making paper, pipes, wax and tallow candles, cotton-spinning, calico-printing, refining salt, &c. R. is said by some authorities to have been the birthplace of the celebrated Mercator, others claiming the honor for Rupelmonde in East Flanders. It has often endured the horrors of being besieged and taken.

ROE-STONE, a name locally given to those limestones which are formed of small globules like the roe of fishes. It has been translated into the scientific term *oplite*, and this is applied to that period in the earth's geological history in which the limestones with this structure chiefly occur.

ROGA'TION-DAYS (Lat. *Feriv Rogationum*), the Monday, Tuesday, and Wednesday before Ascension-day, so called because on these days the Litanies (q. v.) are appointed to be sung or recited by the clergy and people in public procession. The practice of public supplications on occasion of public danger or calamity is traceable very early in Christian use; but the fixing of the days before Ascension for the purpose is ascribed to Mamercus, Bishop of Vienne, in the middle of the 5th c., who, on occasion of a threatened earthquake or other public peril in his city, ordered a public procession and prayer, for the purpose of averting the Divine anger. The usage being in harmony with the spirit of the

times, became general and permanent, and the form of prayer employed is that known as the *Litany of the Saints*. In England, after the Reformation, the recitation of the Litanies upon these days was discontinued; but a memorial of the old practice long survived in the so-called Perambulation of Parishes (q. v.).

ROGER I., Count of Sicily and Calabria, and the founder of the Norman dynasty in these countries, was the youngest of the twelve vallant sons of Tancred de Hauteville, and was born in Normandy about 1081. Hearing of the wondrous success of his brothers (see GUISCARD), who had some time before departed to follow their fortunes, and had by this time gained possession of the greater part of Southern Italy, R. set out in 1058 to join them. On his arrival, he was deputed by his brother Robert to conquer Calabria, an achievement which was speedily executed. In 1060 he set out on an expedition against Sicily, then ruled by a number of Saracen chiefs; but he confined himself in this and the following expedition to predatory attacks on Messina and its neighborhood. He then took and fortified Messina, making it the base of his future operations, and being joined by Robert, the two, at the head of their small band, performed a variety of almost miraculous exploits. They were gradually joined by the Christian inhabitants, especially when their success had given the latter room to hope for freedom from their Moslem masters; and in 1072, Palermo, the capital and chief stronghold of the Saracens, was yielded to the invaders. R. was then invested by his brother with the crown of Sicily, under the title of Count; but it was not till 19 years afterwards that he succeeded in thoroughly supplanting the Saracens, owing to the repeated reinforcements they received from Africa. R. had previously divided the country into fiefs, which he now distributed among his chief barons, whose relations to their subjects were regulated by him with justice and moderation. He had, in 1062, received from Robert his fair share of Calabria, to which, on the death of the latter, he added (1085) a number of towns, wrested from Roger and Bohemond, Robert's two sons. He was now the chief of the Hauteville family; and the fame of his exploits, and the greatness of his power, made his alliance be courted by the first princes of Europe. It was at this time he took the title of 'Grand Count,' to distinguish him from his vassals; and in 1098, he received from Pope Urban II., in recompense for his fidelity to the holy see, the privileges of refusing at his pleasure papal legates admission to his territory, and of appointing bishops. The last acts of his life were the building and endowing of churches and monasteries, among others the cathedral of Messina (1097). He died at Mileto in Calabria, 11th July 1101.

ROGER II., king of Sicily, second son of the preceeding, was born in 1097, four years before the death of his father. His elder brother Simon having died in 1102, he became the heir to the Sicilian throne; and during his minority, the government was administered by his mother, a princess of Montferrat. When R. had taken the supreme authority into his own hands, his first care was to extend his estates. He compelled his cousin William to yield up the portions of Calabria and of the town of Palermo which Robert Guiscard had withheld from his father; and after the death of William (1127), he took possession of Apulia itself, obtaining his investiture in these new possessions (which were fiefs of the holy see) in the following year from Honorius II., who added to them that of the duchy of Naples. Ambitious of the title of king, he supported the faction of Pope Anacletus, his wife's brother, and received from him the title of king of Sicily, with rights of suzerainty over the duchies of Naples and Capua—the former being a Lombardo-Italian, and the latter a Norman principality. In return, R. established Anacletus on the pontifical throne in 1130; but the dispossessed pope, Innocent II., and the exiled princes of Capua and Naples, applied to the Emperor Lothar, who stripped R. of many of his acquisitions—the latter, however, recovering them almost the moment the German army had retired. At last, his bitter enemy, Innocent II., fell into his hands in 1139, and was compelled to withdraw the excommunications he had pronounced against R., and to consent to his retaining the territories he had acquired (excepting Naples), obtaining by these means not only his liberty, but the firm attachment of R. to the holy see, and his own recognition as lawful pope. In 1141, he received from Pope Lucius II. the right of using the staff, ring, tunic, mitre, and other symbols of ecclesiastical dignity and power.

In 1146, he revenged himself on the Greek emperor, who had been of the league with the pope and the emperor against him, by capturing Corfu, and pillaging Cephalonia, Negropont, Corinth, and Athens, returning to Sicily with an immense booty, including a number of workers in silk, by whom the silk-manufacture was first introduced into Sicily. He followed up these successes by the taking of Tripoli and other places on the African coast, and afterwards attacking the Zeirides—leaving, at his death, an African dependency which stretched from Morocco to Kairwan. He died at Palermo 26th February 1154. R. was, like his father,

prudent and resolute, skilful both in the cabinet and on the field; but he had neither the fine deportment nor the generous soul of the first Roger. His mind was capable of great scope and untiring energy, so that the real interests of his states were never overlooked, and the orderly system of taxation and government was a pattern to the rest of Europe. He cared nothing for the religion of his subjects—they might be heathens if they chose; but obedience to himself and respect to the laws were rigorously demanded and enforced. His fleet was supreme on the seas, and his court surpassed in magnificence that of every other prince in Europe. He spent many of his later years in rearing religious edifices on a scale of extreme magnificence, of some of which remains still exist.

ROGERS, HENRY, educated at Highbury for the Independent ministry, became professor of English Literature in University College, London; resigned that post on his appointment to a theological professorship near Birmingham, and was appointed principal of the Lancashire Independent College in 1858. *The Eclipse of Faith* is his best known book. *Reason and Faith* was published in 1866; *The Superhuman Origin of the Bible inferred from Itself*, in 1874. R. died 20th Aug. 1877.

ROGERS, SAMUEL, an English poet, was born in London on the 30th July 1768. His father was a banker and member of a dissenting body. After having been carefully educated, R. was placed in his father's bank. His taste for literature and the company of literary men awoke at an early period, and he, accompanied by a friend, went one day to call on Dr. Johnson, who was then living at Bolt Court, but his courage failed him when his hand was on the knocker. In 1786, he published his first book, entitled *An Ode to Superstition, and some other Poems*. In 1792, he published his *Pleasures of Memory*—the work on which his fame most securely rests. For a considerable period after this, he was silent. Meanwhile, he had retired from business, and in the possession of ample wealth, in his house in St. James's Place, he employed himself with his Muse, his cook, the company of the literary celebrities of his time, and the collecting of pictures and articles of virtù. Then, and during the whole period of his subsequent life, his breakfasts were more famous than his poems. Critics might find fault with the one, but not with the other.

In 1812, he published *Columbus*, a not very striking poetical fragment. In 1814, *Jacqueline* appeared in the same volume with Lord Byron's *Lara*. In 1819, he issued *Human Life*; and in 1822, *Italy*. An edition of the last work, illustrated by the best artists, at the cost, it is said, of £10,000, appeared in 1836. After this date, he published nothing—his time being mainly devoted to taste, dining, epigram, and anecdote. Although aged, he was a greater gadder about than any man of his years in London. He rode or strolled in the parks, he haunted picture galleries, he was a constant attender at the opera. He was by far the oldest English poet. An accident in the street at last confined him to his room; and on 18th Dec. 1855, he died, aged 93. He read Goldsmith's *Traveller* when it was published, and he might have read Tennyson's *Maud*. He published his first book before Burns's first volume appeared at Kilmarnock. Since his death R.'s *Table Talk* has been published.

RO'GUE-MONEY is, in Scotland, an ancient assessment which the freeholders of every county at any of the head courts directed annually to be made in such sums as they judged necessary for defraying the expense of apprehending offenders, subsisting them in jail, and prosecuting them. The functions of the freeholder in the matter were transferred to the Commissioners of Supply by 2 and 3 Will. IV. c. 65, s. 44. The tax was first appointed by a statute of 11 Geo. II. c. 28. The raising and application of the tax are not uniform in the various counties.

ROHILCU'ND, an extensive region in the N.W. Provinces of India, lying west of Oude, and named after the Rohillas, an Afghan tribe which migrated hither in the 18th century. As an administrative division (area, 11,805 sq. miles; pop. in 1872, 5,436,314) it comprises the districts of Bijnur, Moradabad, Bareilly, Budaon, Shahjehaupur and Terai, and the protected state of Rampur.

ROHTU'K, a town of British India, the capital of the district of the same name, in the division of Hissar, Punjab, 42 miles north-west from Delhi. A canal or water-course, 45 miles long, constructed by order of the British government in 1825, supplies R. and the neighboring country with water from the great Ferozeshah Canal. Pop. (1868) 14,153.

RO'LAND, the hero of one of the most ancient and popular epics of early French or Frankish literature, was, according to tradition, the favorite nephew and captain of the Emperor Charlemagne. All that history tells us of him is simply this: In 778, when Charlemagne was busily engaged at Paderborn in organizing the government of the recently-subjugated pagan Saxons, and superintending their collective baptism and formal admission into

the Christian church, he was visited by a Saracen chief, who, being unwilling to recognize the supremacy of the Calif of Cordova, offered to put the Frankish sovereign in possession of several towns south of the Pyrenees which were under his rule. Charlemagne, accepting the offer, marched with a numerous army through the territory of Gascony, whose duke, Loup, he constrained to do him homage, and took Pampelona and Saragossa. Finding, however, that his Saracen ally gave him but little aid, he turned back to return to France; and it was during this retreat, while the Christian army was slowly threading its way through the narrow valley of Roncevaux or Roncevalles (q. v.), that R., commander of the Marches of Bretagne, who commanded the rear-guard, was suddenly attacked by a large body of Vascons, lying in ambush in the surrounding woods, and slain while fighting gallantly. Beyond these meagre details, all that we read of R. is traditional. The oldest version of the *Song of Roland*, forming part of the *Chansons de Geste*, which treat of the achievements of Charlemagne and his paladins, belongs to the 11th c., although it is probable that the original compositions are not much later than the period to which they refer. Throughout the middle ages, the *Song of Roland* was the most popular of the many heroic poems current, and William of Normandy, when on his way to conquer England, had it sung at the head of his troops to encourage them on their march; while at the present day, the traditional memory of the heroic paladin is still held in honor by the hardy mountaineers of the Pyrenees, amongst whose dangerous defiles the scene of his exploits and death is laid.

According to the poem, Charlemagne had been six years in Spain, when, resolving to return to France, he, by the advice of R., sent his captain, Ganelon, on an embassy to the pagan king, Marsilius of Saragossa, to receive the homage which he had pledged himself to perform. The mission was a dangerous one, as all other ambassadors to the king had been slain, and Ganelon, wishing to revenge himself on R., proved a traitor, and betrayed to Marsilius the route which the Christian army were to take. The consequence was, that after Charlemagne had safely crossed the mountains with the main part of his forces, R., who commanded a rear-guard of 20,000 men, was surprised within the narrow valley of Roncevalles, by a terrible army of all the pagan nations of the world. R., who possessed an enchanted horn, which could have been heard far beyond the mountains, might have recalled his uncle, but despising such pusillanimity, he fought on till 100,000 Saracens lay slain around him and the 50 warriors who alone remained alive to aid him. Another army of 50,000 men of Carthage, Ethiopia, and Candia now pours down upon him. At length he blows his horn, which is heard by Charlemagne, who, however, does not return, as Ganelon persuades him once, twice, and thrice that R. is only hunting the deer; and not until the veins of R.'s neck have burst with the violence of the blast, does the emperor retrace his steps. In the meanwhile, R. has dragged his dying limbs to the foot of Mount Cisaire, above Roncevalles, where, after having sung his death-song, and thrown his trusty and enchanted sword Durandal into a poisoned stream, where it still remains, he dies exhausted from his many wounds. Charlemagne, who arrives too late to save him, avenges his death in a series of marvelous battles and bloody victories.—The 83d impression of Léon Gautier's edition of the *Chanson de R.* appeared in 1881. See Bartsch, *Das Rolandlied* (1874).

ROLAND DE LA PLATIERE, JEAN MARIE, a French minister of the revolutionary period, was born at Mizy, near Villefranche (Beaufortais), 18th February 1734. His first independent appointment was that of inspector-ordinary at Amiens. In 1775, at the house of a friend in Amiens named Sophie Cannel, he met Marie Jeanne Philpon, a young woman of brilliant genius and fascinating beauty, and after a courtship of four years, they were married, 4th February 1780. When the Revolution broke out in 1789, R., as well as his wife, became a decided partisan of the movement. In 1791, he was sent to Paris, by the municipality of Lyon, to represent to the Constituent Assembly the deplorable condition of the Lyonnese weavers. After the dissolution of the Constituent Assembly, he founded at Lyon, the *Club Central*, the members of which, marked by their attachment to constitutional liberty, received the name of *Rolandins*. Towards the close of 1791, he fixed himself at Paris, and soon became one of the heads of the Girondist or moderate section of the Republicans. In March 1792, he was appointed Minister of the Interior, a situation which he held till January 1793, when he resigned it, despairing of seeing moderate counsels adopted. After placing his accounts in the hands of the Assembly, he asked permission to withdraw from Paris, but it was refused, and an illegal attempt was made to arrest him, which failed. Immediately after, he fled, and concealed himself in Rouen. When news reached him of the execution of his wife, he committed suicide at a small village in the environs of Rouen, 15th November 1793. R. wrote and published several memoirs and disquisitions on branches of industry, besides 6 vols. of *Letters* addressed to his wife before their marriage, from Switzerland, Italy, Sicily, and Malta.

ROLAND, MADAME (*née* MARIE JEANNE PHILPON), wife of the preceding, was the daughter of Pierre Gratien Philpon, an engraver, and was born at Paris, 17th March 1754. The precocity of her intelligence was remarkable. At the age of four, she had quite a passion for reading; at seven, she learned by heart a treatise on heraldry; at eight, she used to carry Plutarch with her to Church, while the *Jerusalem Delivered* of Tasso, and the *Telemaque* of Fenelon fired her childish imagination. At the same time, an ardent piety began to develop itself, and when only eleven, she entered the *Maison des Dames de la Congrégation*, in the Faubourg Saint-Marcel. Here she formed a close friendship with two young girls from Amiens, Henriette and Sophie Cannel, particularly with the latter, which was fruitful in consequences. On her return to her father's house after the lapse of two years, 'a change came o'er the spirit of her dream.' She no longer cared for the so-called 'religious' writers—the defenders of the Bible and the Church. Her faith was slowly changing from the dogmatic creed of Bossuet to the 'naturalism' of the Encyclopédistes and 'Philosophes.' In ethics, now as ever, her preference for the Stoical system was marked. Shortly after the death of her mother in 1773, she read for the first time *La Nouvelle Héloïse*, which seemed to her (as it has to many another young impassioned soul) a veritable revelation. Greatly distressed by the imprudent conduct of her father, she again withdrew, at the age of 25, to the *Maison des Dames de la Congrégation*, and once more attempted an 'austere' life; but M. Roland (q. v.), who had already known her for five years, now came forward, and rescued her from a career which must ultimately have proved equally unsatisfactory to her reason and conscience, by offering her his hand. She was 25, and he 45. There was certainly something unpoetical in the disparity of their years, but then, Mademoiselle Philpon knew that 'ideal' matches were made only in heaven, and so she accepted calmly the inspector of manufactures. Their marriage was celebrated 4th February 1780.

It is unnecessary to follow the remainder of her career, which was of course identical with her husband's until his flight from Paris 31st May 1793. The same night, she was herself arrested, and imprisoned in the Abbaye. A more dauntless and intrepid spirit never entered its walls! Released on the 24th of June, she was instantly rearrested by the very commissaries who had set her at liberty, without the shadow of a tangible accusation, and confined in Saint-Pelagie. Madame R. spent the period of her imprisonment in study, in the composition of her political *Mémoires*. Summoned before the Revolutionary Tribunal in the beginning of November, she was condemned, and on the 9th was guillotined, amid the shoutings of an insensate mob. It is said that while standing on the scaffold, she asked for a pen and paper that she might 'write down the strange thoughts that were passing through her head.' Only a genuine child of the French Republic could have been so ostentatiously speculative at such a moment. Still more celebrated is her apostrophe to the statue of Liberty, at the foot of which the scaffold was erected: 'O Liberty, what crimes are committed in thy name!' or, according to another version: 'Liberty, how they have played with thy name!'—See *La Correspondance de Madame Roland avec les Demoiselles Cannel* (2 vols., Paris, 1841); *Lettres Autographes de Madame Roland, adressées à Bancel des Issarts* (Paris, 1855).

ROLL, a round moulding much used in Gothic architecture. It is also modified by the introduction of a fillet, and is then called the roll-and-fillet moulding.

ROLL OF ARMS, a heraldic record of arms, either verbally blazoned or illuminated, or both, on a long strip of vellum, rolled up, instead of being folded into leaves. Rolls of arms are the most important and most authentic materials for the history of early heraldry. In England, they go back to the reign of Henry III., the oldest being a copy of a roll of that reign, containing a list of the arms borne by the sovereign, the princes of the blood, and the principal barons and knights between 1216 and 1272, verbally blazoned without drawings. The original has been lost, but the copy, which, having been made by Glover, Somerset herald, in 1586, is called 'Glover's Roll,' is in the English College of Arms. This roll exhibits heraldry as at that early period already consolidated into a system. In the British Museum (Harl. Coll., 6589) is a copy of another roll of the middle of the 13th c., containing 700 coats tricked, that is, drawn in pen and ink. The *Roll of Caerlaverock* is a heraldic poem in Norman-French, reciting the names and arms of the knights present at the siege of Caerlaverock in 1300. It has been published with notes by Sir N. H. Nicolas. Copies exist of rolls of the knights who were with Edward I. at the battle of Falkirk.

ROLLER (*Coracias*), a genus of birds very generally referred to the Crow family (*Corvidæ*), but by many naturalists to the Bee-eater family (*Meropidæ*), with which they regard the habits and colors of the species as indicating a closer alliance. The bill is moderately large, compressed towards the point, straight, the upper mandible curved downwards at the point, the sides

bristled at the base, the gape wide; the legs short and strong; the wings long. The colors are in general very brilliant. Mr. Swainson says of the BLUE-BODIED R. (*C. cyanogaster*) of Western Africa, that 'no effort of art can possibly do justice to those infinitely rich lines of ultramarine, beryl color, and changeable fawn, with which it is ornamented; for there are no tints hitherto discovered, either mineral or vegetable, which will

Roller (*Coracias garrula*).

enable the painter to produce their successful imitation.' The species are pretty numerous, all natives of the Old World, and mostly of the warmer parts of it. One only is found in Europe, the COMMON R. (*C. garrula*), a bird nearly equal in size to a jay; with head, neck, and wing-coverts greenish-blue, other shades of blue strongly marked in the wings.

This bird is abundant in the north of Africa, and in some parts of Asia; it is partially migratory, and is rare in Britain. It tosses its food, which consists of insects or parts of plants, into the air before eating it, swallowing it when it falls in a proper direction for entering the throat. The name R. is derived from its habit of tumbling in the air like a tumbler-pigeon. It is an inhabitant of woods. It is a very shy bird, and the sportsman always finds it difficult to approach. In the countries where it is abundant, as in some islands of the Mediterranean, it is in high esteem for the table.

ROLLER, an agricultural implement which has been long in use, consisting of a cylinder of wood, stone, or iron, placed in a frame, so as to revolve like a wheel, and drawn over the land by a horse. The weight of the roller is greater or less according to the purpose for which it is intended: the breaking of stiff clay clods, the consolidating of very light soils after frost, the hardening of the surface of the ground to check evaporation, the leveling of an uneven surface before harvest operations, &c. For these and such purposes, the roller is in constant use. The introduction of hollow cylinders of iron, instead of solid ones of wood or stone, is an improvement of no remote date, and was the first change on the old simple implement, which was afterwards further modified by dividing the cylinder into two parts, to give greater facility in turning, and to diminish its injurious action in scraping the soil before it while turning; and this process of division being carried further, with other modifications, giving each part or wheel a more independent action, and breaking up the uniformity of surface by giving a raised wedge-like edge to the circumference of each wheel, the result is a *clod-crusher*.

ROLLER, used as part of the inking apparatus in letter-press printing, is of modern invention. In the old process of applying the ink to the surface of types, stuffed leather balls were made use of, which were not only difficult to keep in proper order, but were inapplicable to cylinder-printing. The first improvement on the stuffed balls consisted in covering them with a soft and elastic composition, such as was employed in the Staffordshire potteries. Catching at this idea, the inventors of cylinder printing-machines made rollers by coating longitudinal and rounded pieces of wood with the composition, by means of casting in a mould. This invention came generally into use between 1814 and 1818, everywhere superseding balls, and rendering printing machinery practicable.

The method of making inking-rollers is very simple. A roller may be of any length, to suit work of different kinds; for hand-presses it is usually about 30 inches long, but longer for machines, according to their dimensions. The thickness is about three inches, of which the composition on the wood is probably three-quarters of an inch all round. The wooden center being fixed upright in an iron mould, the composition is poured in when in a hot liquid state, and then left to cool. When cold, the mould which is in halves, finely-jointed and held together, is opened, and the roller taken out: by a little trimming, it is ready for use. The composition consists of a due proportion of fine glue and treacle or molasses, boiled together and thoroughly blended—the result being a substance resembling soft india-rubber. The proportions of the two ingredients depend on the state of the atmosphere. In summer, one pound of glue to one pound of treacle may form a suitable mixture; but in winter, it may be requisite

to give three pounds of treacle to one pound of glue, in order to insure the proper elasticity. Rollers in time, shrivel and waste by use, and the composition may then be remelted, along with some small addition of new materials. In all cases, the rollers require to be kept very clean, and suspended in a rack when not in use. The manufacture and supply of rollers for printers constitute a distinct business in London; but elsewhere, as far as we know, every printing establishment of any consequence possesses means of fabricating rollers for itself.

ROLLIN, CHARLES, a French historian, who formerly enjoyed, if he did not merit, an extensive popularity, was the son of a cutler, and was born in Paris, January 30, 1661. He studied at the Collège du Plessis, where, in 1683, he became assistant to the Professor of Rhetoric, and four years later obtained the chair for himself. In 1688, he was called to the chair of Eloquence at the Collège Royal de France, and for some ten years he discharged the duties of his office with remarkable zeal and success. In 1694, he was chosen rector of the university of Paris, a dignity which he held for two years, and signalized his brief tenure of office by many useful reforms, both in regard to discipline and study, and by his warm defence of the privileges of the university. His efforts to revive the study of Greek, then falling back into neglect, were particularly creditable to him, and altogether his career as rector constitutes perhaps his best claim to the regard of posterity, and has certainly left a more permanent impression than his writings, for its influence is perceptible even to the present day. In 1699, he was appointed conditor to the principal of the College of Beauvais; but was removed from this situation in 1712, through the machinations of the Jesuits, for R. was a strenuous Jansenist. For the next three years he devoted himself exclusively to learned study, the fruit of which was his edition of Quintilian (Paris, 2 vols. 1715). In 1720, he was re-elected rector of the university and in 1726 published his *Traité des Etudes*, which M. Villemain has pronounced 'a monument of good sense and taste,' and which is justly regarded as his best literary performance, for his *Histoire Ancienne* (Paris, 12 vols. 1730—1738), though long prodigiously popular, and translated into several languages (the English among others), is feeble in its philosophy, jejune in its criticism, and often inaccurate in its narrative. Nevertheless, to multitudes, both in this country and in France, it has formed the introduction to the study of ancient history. Frederick the Great, then the Prince-royal, of Prussia, among other princely notabilities, wrote to compliment the author, and opened up a correspondence with him. In 1738, R. published his *Histoire Romaine* (Paris, 9 vols.), a much inferior work, now almost forgotten. He died September 14, 1741.

ROLLING-MILL, one of the most important of modern inventions for the working of metals. It was first introduced practically by Mr. Corb in 1784, and since then has gradually become more and more useful, as its capabilities have been developed. Under the article IRON (q. v.), there is a figure of the iron rolling-mill, by means of which bars of iron are rolled or drawn out, and it will be at once seen that the same machine will do for other metals; moreover, the rolls may be engraved so as to impress a pattern on the bar as it passes through; this is done by the brass-workers to a great extent; and tubes of brass, copper, tin, &c., are also operated on in a similar way, a mandrel or rod of iron being fitted inside the tube, to sustain the pressure of the rollers.

ROLLS, MASTER OF. See MASTER OF THE ROLLS.

ROLLS OF COURT, in Scotch Law, mean the lists of causes depending in the Court of Session.

ROMAGNA. See PAPAL STATES.

ROMAINE, REV. WILLIAM, an English divine of the last century, noted for the ardor with which he preached 'evangelical' and Calvinistic doctrines in an age of religious apathy, was the son of a corn-dealer in Hartlepool, and was born there, September 25, 1714. His father was a French Protestant refugee. Young R. was educated at the grammar-school of Houghton. He was ordained a priest in 1738, and immediately obtained a curacy near Epsom. In 1739, he published a sermon preached before the university of Oxford, in which he attempted to show, in opposition to the view maintained by Warburton in his *Divine Legation of Moses*, that the doctrine of a future state is 'expressly mentioned,' and even 'insisted on,' in the Pentateuch. This led to a controversy with Warburton. In 1747, he published the first volume of a new edition of Calasio's *Hebrew Concordance and Lexicon*, the fruit of seven years' labor.

The only thing in connection with R.'s edition that now calls for notice is the fact, that he took extraordinary liberties with the original, omitting, for example, the author's account of the word which is usually rendered 'God,' and substituting his own in the body of the work! In 1748, he was chosen lecturer of St. Botolph's, in London, and in the following year, lecturer of St. Dunstan's-in-the-West. Two years later, he was appointed assistant morning-preacher at St. George's; but was afterwards

deprived of the situation by the rector, Dr. Trebeck, who was jealous of his popularity, and averse to the 'plainness' of his preaching. His 'evangelicalism' grew with his years; and at length, in 1757, in a sermon on the *Lord our Righteousness*, it became so offensive to the torpid dons of Oxford that the university pulpit was in future closed against him. Some years before this, R. had been appointed to the professorship of astronomy in Gresham College, for which he was not fit, and which he did not retain. His intellect was anything but scientific in its character, as will readily be understood when we state that he allowed his 'zeal' for Hutchinsonian speculations to lead him into opposition to the Newtonian philosophy. In 1756, he became curate and morning-preacher at St. Olave's, Southwark, a situation which he exchanged in the course of a year for a preachship at St. Bartholomew the Great, near West Smithfield. In 1766, he was chosen by the parishioners rector of St. Andrew, Wardrobe, and St. Anne, Blackfriars, an office which he held till his death, July 26, 1795. Besides what has been already mentioned, R. published *Twelve Sermons upon Solomon's Song* (1759); *Twelve Discourses upon the Law and the Gospel* (1760); *The Life of Faith* (1763); *The Scripture Doctrine of the Sacrament of the Lord's Supper* (1765); *The Walk of Faith* (1771); *An Essay on Psalmody* (1775); *The Triumph of Faith* (1795). His works were republished in a collected form, in 8 vols., in 1796, by the Hon. and Rev. W. B. Cadogan, who prefaced them with a life of their author.

ROMAN ALUM. See ROCH ALUM.

ROMAN ARCHITECTURE. Of the early architecture of Rome and the other Latin cities, comparatively little is known. With the conquest of Carthage, Greece, and Egypt, the Romans became acquainted with the arts of those countries, and began to endeavor to use them for the embellishment of the imperial city. Besides, Rome under the empire was the capital of the world, and attracted artists from every country. The result was that the architecture of Rome became a mixed style. It was all imported, and partook of the character of the importers. The great interest of Roman architecture is, that it is a mixture and amalgamation of all ancient styles, and the starting-point for all modern styles. It is thus the connecting link between ancient and modern art; the whole history of Roman architecture being that of a transition, slow but steady, from the external architecture of the Greeks to the internal architecture of the Christians. Rome borrowed from Greece the oblong peristylar temple, with its horizontal construction and decoration, and the various 'orders.' See COLUMN, GRECIAN ARCHITECTURE. From the Tuscans, probably, were derived the circular form of temple and the circular arch, which became leading features in the development of the future Roman style.

The *Orders* imported from Greece were the Doric, Ionic, and Corinthian (q. v.). These were all used in Rome, but with some modifications; the Doric, for example, being never used as in Greece, but without fluting, and with the capital and entablature altered, and a base added, so as to make the style more similar to

Fig. 1.—Doric Arcade.

the others, with which it was often associated. The Ionic had the volutes turned out angularwise, so as to present a similar face in each direction. The favorite 'order' of the Romans, however, was the Corinthian. It was invented in Greece, but more fully developed in Rome, where it suited the desire which existed for richness and luxuriance in architecture. Many fine examples of this style exist in Rome (as the Pantheon, Jupiter Stator, &c.), and in the provinces (as the Maison Quarrée at Nîmes, Baalbec, &c.), the capitals, wherever found, being designed in endless variety.

The composite order was an invention of the Romans, and is sometimes called the *Roman order*. It is a combination of the Ionic and Corinthian. All these orders were used by the Romans, but in a manner peculiar to themselves; they combined with the

Greek orders the arch. They placed the columns (fig. 1) at wide intervals, and set them on pedestals, to give them and the entablature a proper proportion; whilst behind the columns they placed square piers, and from them threw arches which supported the wall. This was the favorite Roman style, and may be seen in all their important works (amphitheaters, arches, baths, &c.). They piled one order above another, marking each story with the entablature. As the style proceeded, vaulting and arching became more common, especially in internal construction, but the horizontal ornamentation was never entirely abandoned. Arches of this construction were thrown from pillar to pillar behind the entablature, and gradually the pier was omitted, and the arch openly thrown from pillar to pillar, the architrave bent round it, and the cornice continued horizontally above.

Fig. 2.—Courtyard at Spalatro.

(From Sir Gardner Wilkinson's *Dalmatia*.)

The buildings executed by the Romans are very varied in their character, but the same style was used for temples, baths, amphitheaters, triumphal arches, tombs, &c. The earliest temples of which remains now exist are those of Jupiter Stator in the Forum, Jupiter Tonans, and Mars Ultor, all of the Augustan epoch, and each with only three columns left. These are supposed to have been nearly peripteral, and it is worthy of notice that the cells are all large, and one of them has an apse.

One of the most interesting temples of Rome is the Pantheon. The portico is of the age of Augustus, but the rotunda is probably considerably later. The dome of the interior is a splendid example of the progress of Roman architecture in developing the use of the arch, and transferring the decoration from the exterior to the interior. The former is in this case totally sacrificed to the latter; but the interior has not yet been surpassed for boldness of construction or simplicity and sublimity of effect. Other examples of circular temples, on a small scale, are found at Tivoli and in Rome, both dedicated to Vesta.

The greatest works of the Romans, however, were not their temples. The Basilicas (q. v.), Amphitheaters (q. v.) and Baths (q. v.) are far more numerous and more stupendous as works of

Fig. 3.—Transverse Section of Basilica of Maxentius.

(From Ferguson's *Hand-book of Architecture*.)

art, and all show how well the Romans had succeeded in producing an internal architecture, which at a later period became so useful as a model for Christian buildings. The Basilica of Trajan is a type of the Christian wooden-roofed churches; while that of Maxentius (fig. 3), with its great intersecting vaults, its vaulted aisles, and buttresses, contains the germs of the greatest Christian cathedrals. The Roman Amphitheaters (q. v.) have never been surpassed for size and grandeur, or for suitability to their purpose. And of the Baths (q. v.), sufficient remains still exist, although much decayed, from the perishable nature of the brick and stucco employed in their construction, to prove that the scarcely credible descriptions of contemporaries were surpassed by the magnificence of the buildings themselves.

Among the other varied public works of the Romans are their Aqueducts (q. v.) and bridges, Triumphal Arches (q. v.), pillars of victory, and tombs. Of the tombs of the Romans, the earliest and best specimen is that of Cæcilia Metella, (wife of Crassus), on the Appian Way (fig. 4). It consists (like most Roman tombs) of a round drum placed on a square basement, and was probably

Fig. 4.—Tomb of Cæcilia Metella.
(From Fergusson's *Hand-book*.)

surmounted by a conical roof. The tomb of Augustus was similar, on a very large scale, and the sloping roof was broken into terraces planted with trees. That of Adrian (now the castle of St. Angelo in Rome) is another enormous example. The tombs were generally arranged along the ways leading to the gates of cities.

The later tombs of Rome are well worthy of study, as they contain many specimens of the transition towards the Christian style. They are generally vaulted, frequently with domes, as, for instance, the tombs of St. Helena and Sta. Costanza. Mr. Fergusson also places the so-called 'Temple of Minerva Medica' (fig. 5) amongst the tombs. It is a beautifully arranged building

Fig. 5.—Plan of the Temple of Minerva Medica at Rome.

with ten sides, all containing deep niches (except the side with the door), surmounted by a clear-story, with ten well-proportioned windows. The vault is polygonal inside and outside; and the pendentives, ribs, buttresses, &c., which played so important a part in the Christian architecture both of the East and West, are distinctly used in its construction.

Of the domestic architecture of the Romans, we have many wonderfully preserved specimens in Herculaneum and Pompeii, showing both the arrangements and decorations of the dwellings of all classes. Of the great palaces and villas, however, none remain except the palace of Diocletian, at Spalatro, in Dalmatia. It is an important building, as it shows many steps in the progress of the style.

ROMAN CATHOLIC CHURCH, the community of Christians throughout the world who recognize the spiritual supremacy of the Pope or Bishop of Rome, and are united together by the profession of the same faith, and the participation of the same sacraments. The subject will be most conveniently treated by considering under separate heads the history of this great Christian community; its doctrinal and disciplinary system; and finally, its organization and constitutional forms, especially as affected by the decrees of the late council of the Vatican, and by other doctrinal constitutions of recent years.

Although a few other points of doctrinal difference separate the Roman Church from the Greek, Russian, and oriental communions, yet the most palpable ground of division lies in the claim of supremacy in spiritual jurisdiction on the part of the Roman bishop. The history of the Roman Church, therefore, in

relation to the ancient oriental churches, is, in fact, the history of this claim to supremacy. In the minds of Roman Catholics, the claim of supremacy on the part of the Bishop of Rome rests on the belief, that Christ conferred on Peter a 'primacy of jurisdiction;' that Peter fixed his see and died at Rome (a position which some Protestant historians have called in question altogether); and thus, that the bishops of Rome, as successors of Peter, have succeeded to his prerogatives of supremacy. In this light, Catholic historians read the facts of the early history of the church—and they trace to this acknowledgment of the superiority of that see, the numerous references to Rome on matters of doctrine or discipline; the appeals from other churches, even those of Alexandria, Antioch, and Constantinople; the depositions or nominations of bishops, examination and condemnation of heresies, of which the first five centuries, especially the 4th and 5th, present examples, but in which Protestant historians only recognize the natural result of the political and social superiority of Rome as the capital of the Roman empire.

The letters of Pope Leo the Great show beyond question that the bishops of Rome, in the commencement of the 5th c., claimed to speak and act with supreme authority; and the first direct challenge to this claim was made by the patriarch of Constantinople, Acacius, and led to a schism of many years, which, however, terminated in the humiliation of the younger see. In all the controversies upon the Incarnation—the Arian, the Nestorian, the Eutychian, the Monothelite—not only was the orthodoxy of Rome never impeached, but she even supplied at every crisis a rallying point for the orthodox of every church. It was so, again, in the Iconoclast controversy; and although Constantinople, in the time of Gregory the Great and again of Nicholas I., renewed the struggle for supremacy or even equality, the superior position of Rome continued to be recognized. The separation of the Greek Church and her dependencies, under the patriarch Michael Cerularius in the year 1054, was but a narrowing of the territorial jurisdiction of Rome; and within that portion of the church which remained faithful, it even enhanced the dignity of Rome, and widened her prerogatives. The abandonment of Italy by the emperors to its fate under the invasion of the barbarians, led to the establishment of the temporal sovereignty of the popes; and the social disorganization of Europe combined with the spiritual authority of the Roman bishop to bring about the general recognition of his authority throughout the kingdoms of Europe as an arbiter in the temporal relations of sovereigns with their subjects, and of sovereigns towards each other. This extraordinary temporal authority was at once the consequence and the support of his acknowledged spiritual power; and even Protestants have recognized the Roman Church of the medieval period as absorbing in itself almost the whole of European Christendom, and as the only public (even though they believe it degenerate and corrupt) representative of the church in the West. The temporary withdrawal of the papal residence from Rome to Avignon, brought with it a notable diminution, at least, of the temporal power of the popes, which was still further weakened by the long western schism, by the conflicts of the rival pontiffs, and the scandals which arose therefrom. The modern political institutions which then began to break upon the world, so modified the public relations of church and state, as by degrees to undo the condition of society in which the temporal power of the popes had its foundation. The great revolution of the 16th c. completed the process.

Nor was the revolution with which the popes thus found themselves face to face without its influence in the external history of the Roman Church. The defections consequent on the Reformation, and at first numerous and formidable, received a check. The great Council of Trent did more to systematize, to define, and to present in popular form the doctrinal belief of Rome, than had been accomplished by the united efforts of the schoolmen of the three centuries which preceded the Reformation; while the decrees of reformation which it enacted, and still more the schemes of local and individual reform which it originated, and to which it gave the impulse as well as the example, tended to bring about an active internal reform. The latter half of the 16th c. was a period of new life in the Roman Church. The celebration of local synods, the establishment of episcopal seminaries, the organization of schools, and other provision for religious instruction—above all, the foundation of active religious orders of both sexes—had the effect of arresting the progress of Protestantism, which in many countries had been at first rapid and decisive; and Lord Macanlay has traced out with curious minuteness the line which marks in the several kingdoms the origin and the progress of this religious reaction.

From the end of the 16th c., therefore, the position of the R. C. Church, especially in her external relations, may be regarded as settled. The local distribution of the rival churches in the world has hardly been altered, except by migration, since that time. But in her relations to the state, the Roman Church has since passed through a long and critical struggle, which is detailed under the heads **GALLICAN CHURCH, FEBRONIANISM, INNOCENT**

XI. The new theories to which the French Revolution gave currency have still further modified these relations; but in most of the European kingdoms they were readjusted after 1815, either by concordat or by some similar mutual agreement. Many conflicting claims on either side, however, still exist; but in the conflict with the state the policy of the R. C. Church has generally been to record her protest against any violation of her right, and, this protest having been made, to submit under protest, unless in what are considered the essentials of faith or of discipline. Where the encroachments of the state are considered to violate the essentials of faith or discipline, the resistance must result in definitive separation, as in the case of England under Henry VIII. and his successors, in Poland under the Czar, and in Prussia in the now pending conflict.

The details of the doctrinal system of the R. C. Church will be best collected and explained from her latest authentic creed, that commonly called 'the creed of Pius V.,' drawn up as a summary of the authoritative teaching of that ecclesiastical body till the time at which it was written, and published together with certain later doctrinal pronouncements. It is only necessary to premise that, while in the view of Catholics (see **RULE OF FAITH**) all doctrine must be based on the Word of God, written or unwritten, the church is the only authoritative judge of that rule of faith. The tribunals which are held to represent this teaching, as well as the subjects to which the privilege extends, and the limits within which it is held to be exercised infallibly, have all been explained under the head **INFALLIBILITY** (q. v.). But Catholics hold, that while the church has authority, when doubts or difficulties arise, to propound in such terms as leave no room for doubt new definitions of faith, nevertheless these new definitions must not be regarded as additions to the accepted faith of the church, or indeed to the original deposit of divine teaching, but only as expositions of former articles, or at most as developments of what already existed in the germ, and has but been evolved by controversy, or brought into practical action by the progress of time, and by the change of the external relations of the church.

The creed of Pius V. is as follows:

'I, N. N., with a firm faith believe and profess all and every one of those things which are contained in that creed which the holy Roman Church maketh use of. To wit: I believe in one God, the Father Almighty, Maker of heaven and earth, of all things visible and invisible, and in one Lord Jesus Christ, the only begotten Son of God, born of the Father before all ages; God of God; Light of Light; true God of the true God; begotten, not made; consubstantial with the Father, by whom all things were made. Who for us men, and for our salvation, came down from heaven, and was incarnate by the Holy Ghost of the Virgin Mary, and was made man. He was crucified also for us under Pontius Pilate, suffered, and was buried. And the third day he rose again according to the Scriptures: he ascended into heaven, sitteth at the right hand of the Father, and shall come again with glory to judge the living and the dead; of whose kingdom there shall be no end. I believe in the Holy Ghost, the Lord and life-giver, who proceedeth from the Father and the Son; who, together with the Father and the Son, is adored and glorified; who spake by the prophets. And in one holy, Catholic, and Apostolic Church. I confess one baptism for the remission of sins; and I look for the resurrection of the dead, and the life of the world to come. Amen.

'I most steadfastly admit and embrace the apostolical and ecclesiastical traditions, and all other observances and constitutions of the same church.

'I also admit the holy Scriptures, according to that sense which our holy mother the Church hath held and doth hold; to whom it belongeth to judge of the true sense and interpretation of the Scriptures; neither will I ever take and interpret them otherwise than according to the unanimous consent of the Fathers.

'I also profess that there are truly and properly seven sacraments of the new law, instituted by Jesus Christ, our Lord, and necessary for the salvation of mankind, though not all for every one: to wit—Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Order, and Matrimony; and that they confer grace; and that of these, Baptism, Confirmation, and Order cannot be repeated without sacrilege. I also receive and admit the received and approved ceremonies of the Catholic Church, used in the solemn administration or the aforesaid sacraments.

'I embrace and receive all and every one of the things which have been defined and declared in the holy Council of Trent concerning original sin and justification.

'I profess, likewise, that in the Mass there is offered to God, a true, proper, and propitiatory sacrifice for the living and the dead; and that in the most holy sacrament of the Eucharist there is truly, really, and substantially the Body and Blood, together with the soul and divinity of our Lord Jesus Christ; and that there is made a conversion of the whole substance of the bread into the Body, and of the whole substance of the wine into the

Blood; which conversion the Catholic Church calleth Transubstantiation. I also confess that under either kind alone Christ is received whole and entire, and a true sacrament.

'I constantly hold that there is a Purgatory, and that the souls therein detained are helped by the suffrages of the faithful.

'Likewise, that the saints reigning together with Christ are to be honored and invoked, and that they offer prayers to God for us, and that their relics are to be had in veneration.

'I most firmly assert that the Images of Christ, of the Mother of God, ever Virgin, and also of other saints, ought to be had and retained, and that due honor and veneration are to be given them.

'I also affirm that the power of indulgences was left by Christ in the church, and that the use of them is most wholesome to Christian people.

'I acknowledge the holy Catholic, Apostolic, Roman Church for the mother and mistress of all churches; and I promise true obedience to the Bishop of Rome, successor of St. Peter, Prince of the Apostles, and Vicar of Jesus Christ.

'I likewise undoubtedly receive and profess all other things delivered, defined, and declared, particularly by the holy Council of Trent; and I condemn, reject, and anathematize all things contrary thereto, and all heresies which the church hath condemned, rejected, and anathematized.

'I, N. N., do at this present freely profess, and sincerely hold this true Catholic faith, out of which no one can be saved; and I promise most constantly to retain and confess the same entire and inviolate, by God's assistance, to the end of my life.'

In addition to these articles, the R. C. Church has, since the compilation of the creed of Pius V., defined certain further doctrines in the controversy on grace, which arose from the teaching of Jansenius (q. v.); still more recently that of the Immaculate Conception of the Blessed Virgin Mary (q. v.); and a still more comprehensive body of articles in the memorable *Syllabus* issued by Pope Pius IX., and in the decrees of the Vatican Council, celebrated under the presidency of the same pontiff.

The doctrinal decisions of this latter council are divided into two sections, the first 'on the Catholic Faith,' the second 'on the Church of Christ.' Each section contains a 'scheme of doctrine,' in which the heads of belief, and the grounds on which they rest, are explained; and to each is appended a body of 'canons,' in which the several points are summarized, stated in precise theological language, and defined as articles of Catholic belief. In the scheme 'upon the Church of Christ' are contained, in 'an additional chapter,' the celebrated declarations regarding the infallibility of the Pope. See *Omnium Concilii Vaticanani Documentorum Collectio* (8vo, Paderbornia, 1873).

The details of the discipline of the R. C. Church would be out of place here. But it may be observed that the R. C. Church leans towards asceticism, as regards the practice of fasting, with less rigor than the Greek and oriental communions; while, on the contrary, as to the celibacy of the Clergy (q. v.), her law is much more stringent; all the clergy of the R. C. Church in the greater orders, including sub-deacons, being so strictly bound to celibacy, that a marriage contracted after ordination is invalid by the church law. See **ORDERS**. In all that regards the general discipline of the whole church, only the pope or a general council is considered to have power to legislate; national or provincial synods for the discipline of a kingdom or province, and bishops for that of their own dioceses.

The constitution of the R. C. Church has been in great part explained in the article **HIERARCHY**. It may be necessary to add that, under the generic name Roman Catholics are comprised all those Christians who acknowledge the supremacy of the Roman pontiff, even though they be not of the Roman or Latin **RITE** (q. v.). Not a few individuals and churches of other rites are included under this designation, Greeks, Slavonians, Ruthenians, Syrians (including Maronites), Copts, and Armenians; and these communities are permitted to retain their own national liturgy and language, and for the most part their established discipline and usages. The most remarkable examples of the diversity of discipline thus introduced under the common rule of the Roman pontiff are the retention in the East of the use of the cup for the laity, and the permission of the marriage of the clergy.

As regards its organization for the purposes of ecclesiastical government, the normal territorial distribution of the R. C. Church of the several rites in the various countries where it exists is into provinces, which are subject to archbishops, and are subdivided into bishoprics, each governed by its own bishop. The total number of archbishops of the several rites in communion with Rome in 1880 was 173, of whom 9 bore the title of patriarch. The number of bishops was 710. But in certain parts of the world, where the population and government are Protestant or unbelieving, the spiritual affairs of the Catholic Church are directed, not by bishops with local titles, but by bishops **IN PARTIBUS INFIDELIUM** (q. v.), who are styled vicars of the pope,

or vicars apostolic. The full number of archbishops and bishops in 1880, including those *retired* and those with sees in *partibus infidelium*, was 1146.

The statistics of the R. C. Church, as contained in the *Orbe Catholico*, published at Rome, give us the total number of Catholics of all nations as 185,000,000. This number nearly corresponds with the total of Roman Catholics as given in the article on Religion (q. v.). In order to avoid unnecessary repetition, we refer to that article for the details of the distribution of Roman Catholics in the several countries; and for the number of those subjects of the pope who follow a rite different from that of Rome, see GREEK CHURCH, RUSSIAN CHURCH, SYRIA, MARONITES.

ROMAN CATHOLIC EMANCIPATION OR RELIEF ACTS.

After the Reformation, both in England and in Scotland, R. Catholics were subjected to many penal regulations and restrictions. As late as 1780, the law of England—which, however, was not always rigidly enforced—made it felony in a foreign R. Catholic priest, and high treason in one who was a native of the kingdom to teach the doctrines or perform divine service according to the rites of his church. R. Catholics were debarred from acquiring land by purchase. Persons educated abroad in the R. Catholic faith were declared incapable of succeeding to real property, and their estates were forfeited to the next Protestant heir. A son or other nearest relation being a Protestant, was empowered to take possession of the estate of his R. Catholic father or other kinsman during his life. A R. Catholic was disqualified from undertaking the guardianship even of R. Catholic children. R. Catholics were excluded from the legal profession, and it was presumed that a Protestant lawyer who married a R. Catholic had adopted the faith of his wife. It was a capital offence for a R. Catholic priest to celebrate a marriage between a Protestant and R. Catholic. Such was the state of the law, not only in England but in Ireland, where the large majority of the population adhered to the old faith.

In Scotland, also, R. Catholics were prohibited from purchasing or taking by succession landed property. The inexpediency and irrationality of imposing fetters of this description on persons not suspected of disloyalty, and from whom danger was no longer apprehended, began about 1778 to occupy the attention of liberal-minded statesmen; and in 1780, Sir George Saville introduced a bill for the repeal of some of the most severe disqualifications in the case of such R. Catholics as would submit to a proposed test. This test included an oath of allegiance to the sovereign, and abjuration of the Pretender, a declaration of disbelief in the several doctrines, that it is lawful to put individuals to death on pretence of their being heretics; that no faith is to be kept with heretics; that princes excommunicated may be deposed or put to death; and that the pope is entitled to any temporal jurisdiction within the realm. The bill, from the operation of which Scotland was exempted, eventually passed into law. An attempt which had been made at the same time to obtain a like measure of relief for the R. Catholics of Scotland, was defeated by an outburst of religious fanaticism. The populace of Edinburgh, stirred up by a body called 'The Committee for the Protestant Interest,' attacked and set fire to the R. Catholic churches, and the houses of the clergy and of such persons as were suspected to be favorable to R. Catholic relief. The frenzy spread to England, where a 'Protestant Association' had been formed to oppose the resolutions of the legislature. See GORDON, LORD GEORGE. In 1791, a bill was passed affording further relief to such R. Catholics as would sign a protest against the temporal power of the pope, and his authority to release from civil obligations; and in the following year, by the statute 33 Geo. III. c. 44, the most highly penal of the restrictions bearing on the Scottish R. Catholics were removed without opposition, a form of oath and declaration being prescribed, on taking which they could freely purchase or inherit landed property.

Endeavors were made at the same time by the Irish parliament to get rid of the more important disqualifications, and place Ireland on an equality in point of religious freedom with England. In 1780, Grattan carried his resolution that the king and parliament of Ireland could alone make laws that would bind the Irish, and separation from England was urged as the alternative with repeal of the disqualifying statutes. The agitation culminated in the Irish rebellion of 1798; the union of 1800 followed, which was partly carried by means of pledges, not redeemed, regarding the removal of the disabilities in question. Meantime, in England, R. Catholics continued subject to many minor disabilities, which the above-mentioned acts failed to remove. They were excluded from sitting and voting in parliament, and from enjoying numerous offices, franchises, and civil rights, by the requirement of signing the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. In the early part of this century, many measures were proposed for the removal of these disqualifications, and in 1813 and succeeding years, one bill for this end after another was thrown out. Mean-

while, the agitation on the subject among the R. Catholics themselves greatly increased, and in 1824 it assumed an organized shape by the formation of the 'R. Catholic Association' in Ireland, with its systematic collections for the 'Catholic rent.' The Duke of Wellington, who, for a long time, felt great repugnance to admit the R. Catholic claims, was at last brought to the conviction, that the security of the empire would be imperilled by further resisting them, and in 1829 a measure was introduced by the duke's ministry for Catholic emancipation. An act having been first passed for the suppression of the R. Catholic Association—which had already voted its own dissolution—the celebrated R. Catholic Relief Bill was introduced by Mr. Peel in the House of Commons on the 5th of March, and after passing both Houses, received the royal assent on the 18th April. By this act (10 Geo. IV. c. 7), an oath is substituted for the oaths of allegiance, supremacy, and abjuration, on taking which R. Catholics may sit or vote in either House of Parliament, and be admitted to most other offices from which they were before excluded. They, however, continue to be excluded from the offices of Guardian and Justice or Regent of the United Kingdom, Lord Chancellor, Lord Keeper, or Lord Commissioner of the Great Seal of Great Britain or Ireland, and Lord High Commissioner to the General Assembly of the Church of Scotland. As members of corporations, they cannot vote in the disposal of church property or patronage. Ecclesiastics or other members of the R. Catholic persuasion, either wearing the habit of their order, or officiating in any place which is not their usual place of worship, or a private house, forfeit £50. Jesuits, and members of orders bound by monastic or religious vows, must register themselves with the clerk of the peace of their county, under a penalty of £50 for every month that they remain in the kingdom unregistered. Jesuits not natural-born subjects, who have come into the country since the passing of the act, are liable to be banished. Persons admitting others to such societies within the United Kingdom, are liable to fine and imprisonment, and those who have been so admitted are liable to be banished.

Restrictions which existed on R. Catholic bequests were removed by 2 and 3 Will. IV. c. 115, as regards Great Britain, and by 7 and 8 Vict. c. 60, with relation to Ireland. Acts 7 and 8 Vict. c. 103, and 9 and 10 Vict. c. 59, abolished a few minor R. Catholic disabilities. For the statutory prohibition against the assumption of ecclesiastical titles in respect of places in the United Kingdom, see ECCLESIASTICAL TITLES ASSUMPTION ACT.

ROMAN CEMENT. See CEMENTS.

ROMAN RELIGION, ANCIENT, a conglomeration of the most widely-different theological or rather mythological elements, introduced by the various strata of immigrations that flowed into the different parts of Italy at different pre-historic times. It was chiefly under Greek influence that it assumed that most characteristic and systematic form, under which it was known during the classical times of Rome, and as which it generally represents itself to our minds. Numa Pompilius (q. v.), that mythic successor of Romulus, is by the primitive legend mentioned as the founder of the Roman religion, or rather ceremonial law. He is probably the type of the period when the religious notions of the Sabines were first joined to the primitive elements of legendary belief of the early settlers. Among the vast number of the different and obscure component elements, the Pelasgian, Sabellian, Oscan, Gallic, &c., out of which grew the recognized state religion, we can, with a comparative amount of clearness, distinguish chiefly three—the Etruscan, the Sabine, and the Latin. The religion of the Etruscans—as distinct from the Pelasgians (q. v.)—has been characterized in our article on that nation. Of the gods of the Latins, many are closely related to those of the Greeks (see GREEK RELIGION), a circumstance easily accounted for by their common eastern origin (see ROME, HISTORY OF); others, however, seem indigenous. Their principal deities are Tellus (q. v.) (the earth) Saturn (q. v.) (god of seeds), and his wife Ops (goddess of earth and plenty), who are somewhat akin to Kronos and Rhea; Jupiter (q. v.), with Juno (q. v.), givers of light. Deities more peculiar to the Latins are Janus (q. v.), and Diana (q. v.). Faunus and Fauna are prophesying wood-deities, and were allied to Lupercus, in whose honor the Lupercalia (q. v.) were celebrated; Piceus and Pilumnus, who preside in some way over agriculture and the fruits of the field; Vesta (q. v.); Fortuna (q. v.); Ferentina, the goddess of leagues.

A certain number of agrarian deities (Anna Perenna, Venus, &c.) make up, with those mentioned, the bulk of 'native' Latin numina. Of chiefly Sabine deities, we name Feronia, the Ferentina of the Latins, a goddess of the soil, who was worshipped with gifts of flowers and fruits; and the two war-gods, Mars and Quirinus—the former a deity at first worshipped under the symbol of shield and spear, and of high importance for colonizations to whom every animal and every human being born in a certain year was sacred; the former being doomed to be sacrificed, and

the latter at the age of twenty to emigrate, and to found new settlements: Quirinus, a deity of strife, closely connected with the myth of Romulus. Sabine deities were also Sol, the sun, Luna, the moon, &c.

Having thus traced some of the principal gods and goddesses (of the greater part of whom fuller information will be found in special articles in the course of this work) to the respective nationality that first introduced them into Italy, we shall now take a brief glance at the Roman Pantheon as it appeared when it had embodied systematically these acclimatized primeval idealizations. For it was as characteristic of the Roman gods to appear in sets, as it was for the more personal gods of the Hellenes to appear singly. The Romans, as it were, made them fall rationally into rank and file, each with a distinct mission of its own, and thus filled with them, as with authorities over special departments, the whole visible and invisible world—above, below, and around. The first rank of all is taken by the three Capitoline deities, the personifications of highest power, highest womanliness, and highest wisdom—Jupiter (q. v.); Juno (q. v.), the Queen of Heaven, and the tutelary deity of women; and Minerva (q. v.). The stars also had three foremost representatives—Sol, the sun, Luna, the moon, and Tellus, the earth.

The supreme deities of the Infernal Regions were Orcus, Dis (Dives, Consus?), and his wife, the Queen of the Empire of the Shadows, Libitina. The element of the water was presided over by Neptune (q. v.); that of the fire by Vulcan (q. v.), the god of the smithies, and Vesta, the goddess of the domestic hearth and its pure flame. Agriculture and rearing cattle were sacred to the ancient Latin king Saturnus, whose wife, Ops—the riches therefrom accruing—had, like Demeter, her seat in the soil. Ceres, Liber, and Libera, the three Greek deities of agricultural pursuits, were superadded about 500 B.C. Pales, the special protector of the flocks, and his festival (the Pallia) were celebrated on the foundation-day of Rome. Mars himself was the supreme deity of the Romans next to Jupiter. Deities of Oracles are Faunus, a deified king, who gave his obscure decisions either in dreams or in strange voices, and his female relative—wife, daughter, or sister—Fauna (Bona Dea), who attends only to the female sex; and the Camenæ, prophesying nymphs, of whose number was Egeria, Numa Pompilius's inspirer. The Apollo worship was but of late growth in Rome. The Paræ represented the unchangeable fate of the individual. Fortuna was, on the contrary, the uncertain chance of destiny, the 'luck' to be invoked at all important junctures. Salus, Pax, Concordia, Libertas, Felicitas, Pietas, Virtus, Honos, Spes, and a host of other abstract notions, explain themselves. Venus first became important when identified with Aphrodite; in the same way as Amor, Cupido, and Voluptas were Greek importations, brought into prominence by the poets chiefly. Life, death, and life after death are made concrete, by the Genii, the Lares, Manes, and Penates. See LARES.

Like the Greeks, the early Romans had no 'mediators,' but addressed their prayers and supplications directly to the individual god. The priesthood, we find, in the classical period, had arisen originally from the 'kindlers' (*flamines*) of Mars, or those who presented burnt-offerings to the early Italian war-god Mars, and the twelve dancers (*Salii*) who in March performed variances in his honor. To these came the 'Field Brethren,' the 'Wolf-repellers,' &c.; and thus by degrees an endless and most powerful hierarchy came to be built up. By the side of it, but not identical with it, were certain sacred colleges, who kept the sacred traditions alive, and who were the supreme authority on religious observances. These were the colleges of Pontifices (q. v.), or Bridge-builders, of Augurs (see AUGURIES and AUSPICES), the keepers of the Sibylline Books (see SIBYL); the twenty Fetiales or state heralds, the supreme—advising, not executing—authorities on international law; the Vestal virgins, on whom devolved the guardianship of the Palladium and of the sacred fire; the Salii (see above), and others. Priests, in the stricter sense of the word, in the service of special deities, were the Flamens (q. v.); while the Dea Dia, the goddess of fields (Tellus, Ceres, Ops, Flora), had the special brotherhood of the twelve Arvalian brothers, with their numerous followers. The state sacrifice, before the expulsion of the mythical kings supposed to have been offered up by these, was offered by a special *Rex Sacrorum* or *Rex Sacrificulus*.

The mode of worship was analogous to that of the Greeks. Votive offerings, prayers, vows, sacrifices, libations, purifications, banquets, lays, songs, dances, and games made up the sum of their divine service. The sacred places were either *fanæ*, *delubra*—mere hallowed spots on hills and in groves—or *templa*, *ades*, special buildings dedicated to a special deity. The latter contained two altars—the *ara*, for libations and oblations; and the *altare*, for burnt-offerings chiefly. Frugality, as it pervaded, in the classical period, the domestic life, so it also prevented all extravagance of offerings to the deity, and all excess of rejoicing before it. Sober and dull, as the Roman religion undoubtedly was—for it never once expanded into the joyful extravagances

of fancy with which the Greek religion was fraught throughout—it at the same time kept free from the abominations that are the natural offspring of that unbounded sway of fancy. Human sacrifices, as far as they are to be met with, grew out of the idea of substitution, and were chiefly enthusiastic voluntary acts of men who threw themselves into the breach; or they carried out decrees of civil tribunals, who had convicted the 'victim' of a deadly offence. In their dealings with the gods, the Romans were pure merchants, carrying out their promises with strict literalness, and thus often fraudulently, against the patent inner meaning of their promise; but the gods were not to them the all-pervading essences, but rather creditors, strict and powerful, yet unable to exact more than was agreed upon outwardly.

A code of moral and ethical rules, furthering and preserving civil order, and the pious relations within the state and family, were the palpable results of this religion, which, in its barrenness of metaphysical notions, did next to nothing for the furtherance of art.

And here we must enter somewhat more fully into that peculiar phenomenon of the utter dissimilarity in the characters of the Greek and Roman religion, at which we have hinted already—a dissimilarity all the more surprising, as the self-same symbolical and allegorical views of nature, filtered through however different channels, form the foundation of both. Both also—especially in their later stages—offer a general analogy not only of deities and spirits, but even of holy places and their mode of worship. But the fact is, that they each took the originally common stock of notions and conceptions, clad more or less in mythical garb, and utterly transformed it, superadding to it from time to time according to their own distinct nationality. It is here, however, that their characteristic traits come out in as forcible a contrast as they do in every other relation of life, in their art and culture, in their states and families. While to the Hellenes the individual was the chief end of all things, and the state existed for the citizen, and the ideal was the *Kalokagathia*, the beautiful, good, the Romans imposed, as the highest duty, submission to authority—the son to the father, the citizen to the ruler, and all to the gods. To them, only that which was useful appeared good. Idleness was not to be tolerated in a community where every single member only existed as far as it contributed to the greatness and aggrandizement of the commonwealth. Hence, with them, a rational thoughtfulness, and a grand and awful austerity in their relations to men and gods; while the Greeks treated both with joyful serenity. The Greek invested his gods with human attributes, and then surrounded them with a halo of highest splendor and most glorious divine beauty; but he constantly modelled and remodelled them, until they reached the acme of beautiful perfection, as would the painter and the sculptor with their work. The Roman, on the other hand, cared nothing for the outward form of his idealized notions—the notions themselves, mere fundamental ideas, were his sole object of veneration.

The Greeks made everything concrete, corporeal, and individual; the Romans abstract and general. The Greeks could only worship allegories; the Romans, abstractions. Hence, also, their utter discarding of many of the myths common to the whole Indo-Germanic stock, the unmarried and childless state of their gods, who, moreover, wanted no food, and did not wander about among men, as did the Indian and the Hellenic. As in the late Midrash, which has partly found its way into Christianity, there is a heavenly Jerusalem right over the earthly Jerusalem, in which all things below were reproduced in an exact but most ideal and divine manner. Thus, the Roman Pantheon was the precise counterpart of the Roman world as it existed in reality. Every man, and thing, and event, and act had a corresponding tutelary deity, that came and went with the special individual, phenomenon, or event, and eternal gods were those only that represented certain great unchanging laws of nature. The angels of the legendary lore of later Judaism and early Christianity, that protect special nations, were with the Romans the gods of these nations, and entered, as their special numina, the divine commonwealth of the Romans simultaneously with the admission of these nations into their own pale or freedom.

As long as the grand old Roman simplicity of manners, the frugality of domestic life, the indefatigable pursuit of agriculture, trade, and commerce, lasted—and all of these were well characterized by the deep reverence paid to gods (albeit not in the highest scale of divine order), who presided over the house, the field, the forest, mercantile enterprise, and the like, Vesta, the Penates, the Silvani, the Lares or Lares, Hercules or Hercules (a native Italian deity, the god of the enclosed homestead [compare Jupiter *herceus*] apparently distinct from the Greek Heracles) as the god of property and gain, whose altar, as god of faith (*Deus fideus*), was as frequently to be met with as those of the goddess of chance (Fors, Fortuna), and the god of traffic (Mercury)—so long did Roman religion, properly so called, retain its firm hold over the people's minds, and its influence cannot well be overrated. But when the antique austerity, the olden spirit of grand independence, the

unceasing hard work that steeled body and soul, had given way to the lazy luxurious ease of later times—then Roman religion ceased to exist in reality, and over its ruins rose a mad jumble of unbelief, Hellenism, sectarianism, and oriental creeds.

The ancient *religio*, the binding faith, which had excited the admiration and astonishment of the Greeks, had waned, and in proportion with the unbelief rose the pomp, and stateliness, and luxury of public worship. To the hierarchy of augurs, oracle-keepers, and pontiffs were superadded special banquet-masters for the divine banquets. The priests more and more freed themselves from taxes and other public burdens, and the custom of perpetual endowments for religious objects crept in, as their influence waxed stronger and stronger. 'Pious services' became as much an item of domestic expenditure as the cook's and nurse's wages. Penny collections for the 'mother of God' were gathered on certain fixed days by the sound of fife and drum played by priests in oriental garb, headed by a eunuch, from house to house, and the whole substance of Roman faith was transformed into an unwieldy mass of dark, grovelling mysticism and shameless profligacy, presided over by wretched gangs of uneducated and unprincipled priests. How this state of things favored the gradual introduction of Judaism and Christianity into the dying days of imperial Rome, has been briefly sketched in GNOSTICS (q. v.). Constantine the Great abolished the last outward trace of Roman religion by proclaiming Christianity as the state religion.—For the greater part of the gods and goddesses mentioned, see special articles. See also GREEK RELIGION, ETRURIA, PELASGIANS, &c. For a fuller account of the whole subject, the reader is referred to Mommsen's *History of Rome* (Eng. transl. Lond. 1864).

ROMANESQUE ARCHITECTURE, the debased style which succeeded Roman architecture, from about the time of Constantine (350 A.D.) to that of Charlemagne (800 A.D.). It is impossible to fix the date of the style definitely, because Roman Architecture (q. v.) was itself a transitional style, and the one fades gradually into the other. When Constantine proclaimed Christianity the religion of the empire, he gave the Christians freedom of action. They could worship in public, and consequently desired buildings for their service; hence the impetus which gave architecture a new start. As explained under APSE and BASILICA, the Christians adopted the Roman hall of justice for their church or place of assembly, and erected many noble basilicas in Rome, Ravenna, and all over the empire. These consisted of three or five aisled halls—the aisles separated by rows of columns. In Rome, the columns, entablatures, and other ornaments were frequently taken from the ruins of ancient buildings which abounded there. The new style is therefore closely allied to the ancient one in the imperial city; but in Ravenna, Jerusalem, Provence, and the remoter districts, where few ancient remains exist, a simpler and ruder copy of the ancient work is found. There is always, however, a certain resemblance to the old forms which distinguishes the Romanesque from the round-arched Gothic which succeeded it. The piers along the aisles are always single columns, generally with caps intended to be Corinthian, and wide arches; the aisles are wide, with open wooden roof; and there are remnants of entablatures, mouldings, &c., which recall the ancient Roman work. The early Christians also derived their round churches from the Romans. They were probably originally tombs, copied from such buildings as the Minerva Medica (see ROMAN ARCHITECTURE), and were the most sacred places, where the burial-service was said, and the sacraments administered. Hence they afterwards became Baptisteries (q. v.), and were finally absorbed into the church (see RHENISH ARCHITECTURE), which then contained within itself everything connected with the Christian service.

In Rome there are still some thirty basilicas, and the Romanesque

Romanesque Interior.

style may be said never to have died out there. As we recede from the center, we find its influence gradually weakened, and suc-

cumb to the Northern Gothic style. Thus, in Lombardy and Provence, it was superseded by the Lombard (q. v.) and Romance styles in the 11th and 12th centuries; while in Byzantium and the East, it gave way to the Byzantine style about the time of Justinian. Amongst the finest examples remaining are St. Paul's (see BASILICA) and Sta. Maria Maggiore at Rome, and at Ravenna, St. Apollinare; the interior decoration of which last (see fig.) is very beautiful. The mosaics of the apse, the painted walls, and the inlaid pavements of the Romanesque churches, are amongst their finest features. In color, they always excel.

In Tuscany, there is a late form of Romanesque, of which the cathedrals at Pisa and Lucca, San Miniato at Florence, and many churches in those cities, are examples. They are intermediate specimens, built during the 11th c., when the cities became prosperous, and have a certain amount of Gothic feeling; but although beautiful in colored decoration, they have not the simple grandeur of the early basilicas; and although more decorated externally than these, they have not the bold and purpose-like appearance of Gothic elevations.

ROMANIC LANGUAGES, a general name for those modern languages that are the immediate descendants of the language of ancient Rome. In those parts of the empire in which the Roman dominion and civil institutions had been most completely established, the native languages were speedily and completely supplanted by that of the conquerors—the Latin. This was the case in Italy itself, in the Spanish peninsula, in Gaul or France, including parts of Switzerland, and in Dacia (see under MOLDAVIA). When the Roman Empire was broken up by the irruptions of the northern nations (in the 5th and 6th centuries), the intruding tribes stood to the Romanized inhabitants in the relation of a ruling caste to a subject population. The dominant Germans continued for several centuries to use their native tongue among themselves; but from the first they seem to have acknowledged the supremacy of the Latin for civil and ecclesiastical purposes, and at last the language of the rulers was merged in that of their subjects; not, however, without leaving decided traces of the struggle—traces chiefly visible in the intrusion of numerous German words, and in the mutilation of the grammatical forms or inflections of the ancient Latin, and the substitution thereof of prepositions and auxiliary verbs. It is also to be borne in mind that the language which underwent this change was not the classical Latin of literature, but a popular Roman language (*Lingua Romana rustica*) which had been used by the side of the classical, and differed from it—not to the extent of being radically and grammatically another tongue, as some writers unwarrantably conclude—but chiefly by slovenly pronunciation, the neglect or misuse of grammatical forms, and the use of 'low' and unusual words and idioms. As distinguished from the old *lingua Latina*, the language of the church, the school, and the law, this newly-formed language of ordinary intercourse, in its various dialects, was known as the *Lingua Romana*; and from this name, probably through the adverb *Romanice*, came the term Romance (Prov. and O. Fr. *romans*, Sp. *romance*, It. *romanzo*), applied both to the language and to the popular poetry written in it, more especially to the dialect and productions of the troubadours in the south of France.

According to the theory of Raynouard (q. v.), the new language that sprang out of the corruption of the Latin was at first essentially the same over all the countries in which Latin had been spoken, and is preserved to us in a pure state in the Provençal, or language of the troubadours; and it was from this as a common ground, and not from the original Latin, that the several Neo-Latin tongues diverged into the different forms which they now present. This theory is not accepted by more recent inquirers; its groundlessness has been demonstrated by Sir G. Cornewall Lewis in his elaborate *Essay on the Origin and Formation of the Romance Languages* (2d ed. Lond. 1862). It is beyond doubt that the several daughters of the mother Latin had their characteristic differences from the very first, as, indeed, was inevitable. The original Latin spoken in the several provinces of the Roman empire must have had very different degrees of purity, and the corruptions in one region must have differed from those in another according to the nature of the superseded tongues. To these differences in the fundamental Latin must be added those of the superadded German element, consisting chiefly in the variety of dialects spoken by the invading nations and the different proportions of the conquering population to the conquered. French, e. g., as was to be expected, is richer in German words than any other member of the family, having 450 not found in the others. Italian is next to French in this respect. There are about 900 in the Romance languages altogether, of which about 800 are common to them all. A great many of these words are terms relating to warfare.

The varieties of speech originating in the way now described (which first received the general name of Romanic* languages in

**Romanic* seems preferable to *Romance*, the term employed by many English writers, both as being more in analogy with *Italic*, *Arabic*, &c., and as avoiding the association with a particular kind of literature, and the special Neo-Latin tongue in which that literature was originally written—viz., the Provençal.

recent times from German scholars—*Romanische Sprachen*) are divided by Diez into six jurisdictions :

1. The Italian, preserving, as was to be expected, the traits of the mother Latin in more recognizable form than any of the sister tongues. It presents a variety of strongly marked dialects.

2. The Walachian (see under MOLDAVIA).

3. The Spanish, which is characterized by copiousness and etymological obscurity, arising from the establishment of so many different nations on the soil. For one element of difference, it contains a large number of Arabic words—as many as 500 terms have been enumerated. Of the various dialects, the Castilian is considered the standard.

4. The Portuguese, including both the language of Portugal and of Galicia; it is nearly akin to the Spanish, but differs too much in some points of grammar to be reckoned a mere dialect.

5. Provençal, the language of the south of France, extending on the one side into Spain over Catalonia, Valencia, and the Balearic Isles; and on the other over Savoy and part of Switzerland, about the Lake of Geneva. The line of division between the Provençal and the northern idiom which has now become the literary language of the whole of France, is usually drawn through Dauphiné, Lyonnais, Auvergne, Limousin, Perigord, and Saintonge. From the use of the affirmative *ou* (= yes), the Provençal was known as the *Langue d'oc*, as the northern French was called the *Langue d'oïl*, from *oil*, modern French *oui* (see *LANGUEDOC*)*. The Provençal was at an early period a cultivated language, with a regular system of grammar, and in the 12th and 13th centuries, produced a rich poetical literature (see *TROUBADOURS*).

6. French, extending over the northern half of France, and parts of Belgium and Switzerland. Diez conceives that at first northern French may have been little different from Provençal, but, beginning with the 9th c., it has been more and more distinguished by the greater wearing away of the original grammatical forms. See *FRENCH LANGUAGE AND LITERATURE*.

The language of the canton of the Grisons (q. v.), anciently *Rhatia*, though sufficiently distinct from Italian and French, is not considered by Diez to have attained sufficient fixity or independence to deserve being ranked along with the others as a seventh Romanic tongue. It is called by the Germans *Curwälsch*, by the people themselves *Rumonsch*. There are two chief dialects, the Oberland, about the sources of the Rhine, and that spoken in the Engadine (q. v.), called the Ladin.

The chief authorities on this subject are the two great works of Diez (q. v.), the *Grammar* and the *Dictionary of the Romanic Languages*. The *Dictionary* and the *Introduction to the Grammar* have been translated into English.

ROMANOFF, THE HOUSE OF, of which the present imperial family of Russia is the chief representative, is said to have derived its origin from a Lithuanian prince of the 4th c.; but however this may be, it is certain that the family did not make its appearance in Russia till the 14th c., when Andrew Kobyla emigrated from Prussia to Moscow in 1341, and entered the service of the then grand-duke, Simeon the Pious. Andrew's descendants became boyars early in the 15th c., their territories lying in the government of Vladimir, and district of Jurief-Polskoi. The boyar *Roman Jurievitch*, the fifth in direct descent from Andrew, died in 1543, leaving a son and daughter; the latter of whom became czarina by her marriage with Ivan the Terrible; while the former, *Nikita Romanovitch Jurief*, by his nuptials with the Princess of Susdal (a direct descendant from a brother of St. Alexander Nevskoi), was also allied to the royal race of Rurik.

Nikita was one of the regency during the minority of Feodor I.; and his eldest son Feodor, under the name of *Philarete*, was elevated to the rank of archimandrite and metropolitan of Rostof during the reign of the false Dmitri. The Romanoffs supported that party who tendered the Russian crown to the Polish prince, and Philarete had gone with that view to Poland, when a sudden outburst of national sentiment put a stop to these negotiations, and the unlucky envoy was in consequence thrown into prison by the enraged Poles. The national party now proceeded to the election of a native sovereign, who should be as closely allied as possible by blood to the race of Rurik; and after much hesitation and many rejections, they chose MIKAIL FEODOROVITCH ROMANOFF, the son of the imprisoned metropolitan, and the representative through his grandmother of the royal house of Rurik, 21st February 1613. This selection, which had been made by the higher nobility and the clergy, was rapturously applauded by the people; and though the new czar was not quite seventeen years of age, the general desire of all classes to conform to his ordinances rendered the cares of government comparatively light. He was succeeded by his eldest son, *Alexei Mikailovitch* (1648—1676), an able prince, who carried on war with varied success against the Swedes and Poles, and acquired a great reputation as a legislator. Alexei

was twice married, and left by his first wife two sons, Feodor and Ivan, and many daughters, and by his second wife, one son, Peter. His eldest son, *Feodor* (1676—1682), was a prince of much talent and foresight, and labored with success to reduce the power of the aristocracy; but being of a very weak constitution, he died at the age of twenty-five without posterity, leaving the throne by his will to his half-brother, Peter, as his full brother, Ivan, was an imbecile. However, it was not till seven years after this that *Peter* (see *PETER THE GREAT*) succeeded in obtaining possession of the throne. It is worthy of remark, that hitherto all the czars in the House of R. had mounted the throne before attaining twenty years of age. Peter (see *PETER THE GREAT*) was twice married; by his first marriage, he had a son, Alexis (q. v.), who died during his father's lifetime, leaving one son, Peter, afterwards Peter II.; and by his second marriage with *Catharine I.* (q. v.) 1725—1727) he had two daughters, Anne and Elizabeth.

Catharine I. left the throne to her step-grandson, *Peter II.* (1727—1730), the last of the male line of R.; and on his death without heirs, the succession reverted to the female line. Ivan, Peter the Great's half-brother, had also left daughters, and their claims to the crown being preferable, one of them, *Anna Ioannovna* (1730—1740), was placed upon the throne, and was succeeded by her grand-nephew, *Ivan IV.* (1740—1741); but then a revolution drove Ivan's family from the throne, of which the cadet female line in the person of *Elizabeth* (1741—1761), the daughter of Peter the Great and Catharine, obtained possession. Failing heirs of Elizabeth, her nephew, Peter, the son of her elder sister, Anna Petrovna, who had married the Duke of Holstein-Gottorp (a cadet of the family of Oldenburg), and died in 1728, was the heir-presumptive; and accordingly, on her death in 1761, he mounted the throne as *Peter III.* (1761—1762), founded a new dynasty, that of *ROMANOFF-OLDENBURG*; but his brief tenure of power was put an end to by his assassination, at the instigation of his wife, the princess Sophia-Augusta of Anhalt-Zerbst, who, as Catharine II. (1762—1796), wielded the sceptre of this mighty empire for the long period of thirty-four years. She was succeeded by *Paul I.* (q. v.) (1796—1801), her only son by Peter III.; and Paul, after a brief reign, was also assassinated, leaving several sons, the eldest of whom was *Alexander I.* (1801—1825); but as he left no issue, the crown at his death devolved by right upon his next brother, Constantine. Constantine had, however, in compliance with the wish of his elder brother, previously relinquished his claims to the supreme power, and the third brother, *Nicholas I.* (1825—1855), in consequence ascended the throne. Nicholas left at his death four sons and several daughters, and his eldest son, *Alexander II.* (1855) was the late czar.

ROMANS, a town of France, in the dep. of Drome, stands on the right bank of the Isère, 14 miles north-east of Valence. A bridge, founded in the 9th c., connects R. with the small town of Peage on the left bank of the river. R. owes its origin to an important abbey, founded in the 9th c. by Saint Bernard, Archbishop of Vienne, and by a nobleman named Romain, who gave his name to the town. Silk and woollen fabrics are largely manufactured, and a very active general trade is carried on. Pop. (1872) 9893; (1876) 11,024.

ROMANS, EPISTLE TO THE, in a doctrinal point of view, the most profound and elaborate composition of St. Paul. That it proceeded from the pen of the great apostle of the Gentiles, has never been seriously doubted by any competent scholar. Much discussion has taken place regarding the *composition* of the church at Rome, and—connected therewith—the design or object of the epistle. Were the members of the church Jewish or Gentile Christians? The general opinion of commentators is, that the church was a mixed congregation, the majority of members being probably of pure Gentile descent, and the minority, Jewish Christians, who perhaps formed the original nucleus of the church. Dr. Jewett, in his *Epistles of St. Paul to the Romans, Galatians, and Thessalonians*, suggests that the phenomena of the text—for example, the frequent appeals to the authority of the 'law' addressed to Gentiles—may be best explained on the hypothesis that the apostle is speaking to a Gentile congregation which had passed through a phase of Jewish proselytism. The great value of the Epistle to the Romans consists in this, that it exhibits what may be called the *rational* of Christianity.

The immediate object of the apostle was probably nothing more than to prevent an outbreak in the church at Rome of those violent antipathies of religious sentiment which had shown themselves elsewhere (for instance, at Corinth), and had produced such disastrous consequences; but with a view to the more complete accomplishment of this object, he takes a broad *ethical* view of human nature, and finds all men—Jews and Gentiles alike—to be estranged from God, and in need of pardon and reconciliation. He does not underrate the advantages which his Jewish countrymen possessed—nay, he extols them; but he points out at the same time that the 'oracles' or 'law' could not make the Jews holy :

* Instead of the etymologies of *oc* and *oïl* given in the article referred to, Diez derives *oc* from Lat. *hoc*, this (equivalent to Eng. *so*, Ital. and Fr. *si*, which are only other forms of the Pronoun [q. v.] *sa* or *io*); in the north, *oc* was first shortened into *o*, and then compounded with *il* (Lat. *hoc ille*).

they could only condemn them for being unholy. The Gentiles were declared guilty not less decisively by their own consciences—the law was plainly enough 'written in their hearts.' Hence Paul's grand argument, that if men are to stand as 'righteous' in the sight of God, it cannot be by their 'works,' but in virtue of a divine justification graciously vouchsafed to them, and received into their hearts by an act of faith. This leads him to unfold the purpose and significance of Christ's work, to dilate on the 'freeness' of God's grace towards 'sinners.' He concludes by predicting the conversion of his 'kinsmen according to the flesh,' exhorting the Gentiles to humility, charity, mutual forbearance, and the practice of all the Christian virtues. The Epistle is believed to have been written from Corinth during Paul's third missionary journey, about 58 A.D. The commentaries upon it, or upon special chapters, are innumerable; and almost all the great doctrinal controversies that have agitated Christendom owe their origin to it.

ROMANTIC SCHOOL, the name first assumed in Germany, about the beginning of the present century, by a number of young poets and critics, A. W. and Fr. Schlegel, Novalis, Ludwig Tieck, Wackenroder, &c., who wished to indicate by the designation that they sought the essence of art and poetry in the wonderful and fantastic—elements that pre-eminently characterized the Romance literature of the middle ages. Their efforts were directed to the overthrow of the artificial rhetoric and unimaginative pedantry of the French school of poetry, even then influential, and to the restoration of a belief in the mystery and wonder that envelop the existence of man—a belief that had been rudely assailed and mocked by the prevailing materialism in all departments of thought. Thus, their purpose was twofold—it was in part æsthetic, and in part religious. As poetical reformers, the Romantic School in Germany unquestionably exercised a most beneficial influence; but as religionists—though their aim was intrinsically high and noble—they more or less consciously subverted the designs of a reactionary government, and so came to be hated and distrusted by the liberal politicians and thinkers of Germany.—See Eichendorff's *Ueber die ethische und religiöse Bedeutung der neuern Romantischen Poesie* (Leip. 1847); H. Heine's *Zur Geschichte der neuern schönen Literatur in Deutschland* (Hamb. 1833); Hettner's *Die Romantische Schule* (1850); R. Haym's *Die Romantische Schule* (1870); and the Danish work of Brandes (1873).

Between twenty and thirty years later, a similar school arose in France, and had a long struggle for supremacy with the older Classic School. It was victorious, but not wise, and, except in a few instances—such as Lamartine and Victor Hugo—it has rushed into excesses of caprice both literary and moral, which have stamped it with a revolutionary rather than a reformatory character.—See Huber's *Die Romantische Poesie in Frankreich* (1832); Tannet's *Prosodie de l'Ecole Moderne* (1844); Gautier's *Histoire du Romantisme* (Par. 1874).

ROME. The design of this article is to furnish the reader with a brief outline of the ETHNOLOGY and HISTORY of ancient Italy, in so far as these are not already discussed or described under particular heads, to which reference will be made. As the Roman state gradually conquered and incorporated with itself the other states and territories of the Italian peninsula, and as these (in general) figure separately in history only during the process of this subjugation, it will be most convenient to consider them here.*

Ethnology.—In the earliest times we find in Italy *five* distinct races; three of which (IAPYGIANS, ETRUSCANS, and ITALIANS) may, in a restricted sense, be termed 'native,' inasmuch as we do not meet with them elsewhere; and two, GREEKS and GAULS, 'foreign,' inasmuch as their chief settlements were not in Italy, but in Greece and Gallia. But ethnologically, this distinction is arbitrary. There is no reason for believing that the first three races were indigenous, and the last two, immigrant; the analysis of their languages, or of such fragments of their languages as survive, leads strongly to the conclusion that all were alike immigrant, and that in this respect the only difference between them is one of time.—1. *The Iapygians.*—This race, monuments of which in a peculiar language (as yet undeciphered), have been found in the south-east corner of Italy—the Messapian or Calabrian peninsula—is in all probability the oldest.—2. *Etruscans.*—The origin of this mysterious people is certainly one of the most interesting, if also one of the most insoluble problems in history. It is not, however, necessary to say anything about them here, as their history, character, and civilization are handled at length in the article ETRURIA.—3. *Italians.*—At what period the earliest immigrations into Italy of the so-called 'Italian' races—the Latins and Umbro-Sabellians, took place, it is wholly impossible to tell; but it was undoubtedly long before the Etruscans had settled in Etruria. They were by far the most important of the various races that inhabited the peninsula; in fact, the entire historical significance of Italy depends upon them; and therefore it

is fortunate that their ethnological origin and affinities are capable of the most certain demonstration. An investigation of their language, subdivided indeed into numerous dialects, often widely differing but fundamentally the same, has resulted in the discovery that they belong to the great Aryan or Indo-Germanic family (see ARYAN RACE and ARYAN LANGUAGES), and are in particular closely allied to the Hellenes. We are therefore warranted in affirming that at some very remote period a race migrated from the East, embracing the ancestors of both Greeks and Italians. By what route they proceeded, or at what point they diverged, we can only conjecture, for the problem is not yet solved whether the Hellenes reached Greece by way of Asia Minor or from the regions of the Danube; but, at any rate, Mommsen's statement that 'the Italians, like the Indians, immigrated into their peninsula from the north,' may be regarded as certain.

There is ground for believing that the Latins were the first members of the Italian family to enter Italy, and that, having crossed the Apennines, they spread themselves to the south along the western coast, driving the Iapygians before them, and finally cooping them up in the Calabrian peninsula—the heel of the boot. But this conquest belongs to prehistoric ages, and the original Latins of Campania, Lucania, Bruttium, perhaps even Sicily (i.e., the races spoken of in classic legend, as the Itali, from whom the peninsula received its name, the Margets, Ausones, Siculi, &c.), were themselves in the course of time so thoroughly Hellenized by the influence of the rich and powerful Greek colonies planted on their coast (see MAGNA GRÆCIA), or so overwhelmed by the successive invasions of Samnite hordes, that nearly every trace of a primitive Latin nationality had disappeared, and only here and there a solitary linguistic or legendary relic survives to indicate faintly the path which conjecture should pursue. It was only in Latium Proper, where no Greek colonies were founded, and where the fortune of war was in its favor, that the Latin branch of the Italian race firmly rooted itself. There, however, it did flourish, and petty as the district might seem—not more in all than 700 square miles—it was incomparably the most important in the peninsula, for within its limits rose those seven hills on which a city was to be built that was destined to subdue and govern the world. The other branch of the 'Italian' stock—the Umbro-Sabellian, must have entered Italy at a later period than the Latin. Its advance along the central mountain-ridge—the Apennines—from north to south can still be traced; and its last phases—i.e., the contest of Campania and the other southern districts of the peninsula by the Semite highlanders—belong to purely historical times. The oldest members of this branch are probably the Sabines (q. v.), who seem to have fixed themselves in the mountainous region to the north-east of Rome, and are regarded as the progenitors of that multitude of tribes which we find occupying the central portion of Italy—the Picentes, Peligni, Marsi, Æqui, Vestini, Marucini, Frentani, Samnites—perhaps also the Volsci and Hernici.

4. *Gauls.*—To a period considerably later and comparatively historical, belong the settlement of the Gauls in the north, and of the Greeks in the south of Italy. The former a branch of the Celtic race, itself now ascertained to be also a member of the great Aryan family (see CELTIC NATIONS), and therefore allied, however distantly, to the other Italian races, had, for ages before history begins, fixed themselves in the region now known as France. Finding further progress westward barred by the waves of the Atlantic, and being of a restless and excitable disposition, they turned their steps east and south-east, broke over the Alps (according to the legend in Livy, by the Little St. Bernard) some time during the 3d c. after the founding of Rome, and poured down into the plains of the Po. The first Gallic tribe that made its appearance on the soil of the peninsula is said to have been the Insubres, whose capital was Mediolanum (Milan); then followed the Cenomani, whose headquarters were Brixia (Brescia) and Verona, and afterwards numerous kindred hordes, among the latest and most powerful of whom were the Boii (q. v.) and Senones, who forced their way across the Po, and effected a lodgment in the modern Romagna, occupying (besides an inland district) the coast of the Adriatic as far south as Ancona. Hence, in ancient times, the whole of northern Italy was for a long period known as Gallia Cisalpina (Gaul on *this*, i.e., the Italian side of the Alps), to distinguish it from Gaul Proper, which was called Gallia Transalpina. Gallia Cisalpina was again subdivided into two parts by the river Padus (Po); the northern being named Gallia Transpadana, and the southern (the country of the Boii and the Senones), Gallia Cispadana. Various other tribes or peoples are found in the north of Italy, such as the Ligurians (along the Gulf of Genoa) and the Veneti (in modern Venetia), regarding whose origin—in the absence of all linguistic and other memorials—we are utterly in the dark. 5. *Greeks.*—The other people which we have distinguished as 'foreign,' was the Greek. There is, however, this distinction to be observed, that the Greeks were not (like the Gauls) barbarians; they did not swoop down upon the southern shores of Italy (like the Norse pirates on

* The map of Ancient Italy will elucidate the geographical references of the present article.

the coasts of England and France) to plunder and devastate; nor did they force their way into the interior and dispossess the native inhabitants; they merely colonized the coasts, built cities, and carried on commerce. Through them it is probable the Romans acquired their earliest notions of the Greek literature, philosophy, and cultus. For further information concerning them, we refer the reader to the article *MAGNA GRÆCIA*, and to such of their cities as have received separate treatment.

Primitive Social Condition of the Latins.—With this brief introductory sketch of the various races that inhabited Italy in historical or pre-historical times, we may now revert to the Latins, with whom we have at present more particularly to do. What was the extent of their civilization, or how far their social organization had proceeded when they finally settled in the 'broad plain' (*Latium*, connected probably with *latus*, broad; *latus*, a side; *Gr. platus*; Eng. *flat*) that stretches westward from the Alban Hills to the sea, may be conjectured, but cannot be positively ascertained. We know, indeed, that long before they had set foot in Italy, before even they had branched off from their Hellenic brethren, they had ceased to be mere nomades, or wandering shepherds. The evidence of this fact lies in their language. Not only do the names of the oldest Latin nations, as the *siculi*, ('the sickle-bearers' or 'reapers'), and the *osci*, or *opsci* ('field laborers'), clearly prove the antiquity of Italian husbandry; but the oldest agricultural terms are actually common to both Latins and Greeks (e. g., Lat. *ager*, *Gr. agros*; Lat. *aro*, *aratrum*, *Gr. aroo*, *arotron*; Lat. *ligo*, (a hoe), *Gr. lachaino*; Lat. *hortus*, *Gr. hortos*; Lat. *milium*, *Gr. meline*; Lat. *rapa*, *Gr. raphanis*; Lat. *malva*, *Gr. malacha*; Lat. *vinum*, *Gr. oinos*). Moreover, the form of the plough was the same among both peoples, as also their mode of cutting and preparing the grain; many of the usages of social life; the oldest methods of measuring the land; and the style of their national dress—the Latin *tunica*, corresponding exactly with the Greek *chiton*, while the Latin *toga* is only a fuller *himation*. Their method of building was also the same. Such evidence (and it could easily be extended) must be regarded as conclusively showing that before the Latino-Italians entered Italy, they had been accustomed to till the ground, to make wine, to keep gardens, to build houses, and to decently clothe themselves. As to their social organization, less can be said. It appears, however—judging from the general bearing of the most ancient traditions, as also from the features exhibited in historical times—that at a very early period, and from causes of which we are now absolutely ignorant, they had begun to develop the germs of what may be called 'state-life.'

As among their Hellenic brethren, the original foundation of their social constitution was 'households' (*Gr. oikiai*, Lat. *vici* or *pagi*, from *pangere*, to 'fix' or 'drive in'; hence 'to build'): these, either by ties of blood, or by nearness of locality, were aggregated into clans, and their dwellings formed clan-villages (thus *pagus*, which probably meant at first only a single 'household,' came, by a natural transition, to denote a collection of households—a hamlet or a village). Such clan-villages were, however, not regarded as independent societies, but as parts of a political canton or community—the *civitas* or *populus*. Each canton or *civitas* possessed a local center or place of assembly, where justice was administered at regular intervals, where markets and sports were held, and religious rites celebrated, and which was besides fortified to serve as an asylum or place of refuge for the inhabitants of the open hamlets and their cattle in time of war. Such a center was termed the *capitolium*, i. e., 'the height,' from being originally fixed on a height or hill-top, and corresponded to the *akra* of the Greeks. Round this stronghold of the canton, which formed the nucleus or beginning of the earliest Latin towns, houses gradually sprung up, which in their turn were surrounded by the *oppidum* ('work' from *opus*), or the *urbs* ('ring-wall,' connected with *urvus*, *curvus*, *orbis*); hence, in later times, *oppidum* and *urbs* became, naturally enough, the recognized designations of town and city. Evidence is not wanting to justify this view of the genesis of the Latin towns. In the ruder and more mountainous districts of Central Italy, occupied by the Marsi, Æquicoli, &c., the system of living only in open villages prevailed down even to the close of the Empire, and there the Roman antiquarians found to their inexplicable surprise, those solitary strongholds with their mysterious ring-walls, which on the soil of Latium Proper, expanded into towns, but in the recesses of the Apennines never advanced beyond their original design.

The sites of the oldest of these cantonal-centers or primitive towns in Latium are to be sought for on the slopes of the Alban hills, where the springs are freshest, the air most wholesome, and the position most secure. Tradition (which makes Alba Longa the oldest seat of a Latin community) is here in accordance with natural probability.* On the same slopes lay Lanuvium, Aricia, and Tusculum, to the great antiquity of which ancient

tradition bears testimony in many ways; on the offshoots of the Sabine range, in the east of Latium, stood Tibur and Praeneste; in the plain between the Sabine and Alban ranges, Gabii, Labici, and Nomentum; on or near the coast, Laurentum and Lavinium; and on the isolated hills overlooking the Tiber (the boundary between Latium and Etruria), the frontier town of Rome. How many cantons were originally in Latium, it is neither possible nor important to know. Tradition mentions 80 sovereign or politically independent communities (with Alba Longa at their head), which formed the famous Latin league. The historical order of their constitution is a point regarding which we are equally ignorant, but there is reason to believe that the Roman canton, or at least its capital, the town of R., was among the latest political organizations of the Latins. The history and fortunes of this canton we now proceed briefly to trace.

History of R. during the Earliest or Regal Period.—According to the myth of Romulus, R. was an offshoot from Alba-Longa, and to the biography of that hero we refer the reader for an outline of the ancient legend; but the most rational view of the city's origin is that which is suggested by a consideration of its site. It probably sprang into existence as a frontier-defence against the Etruscans, and as an emporium for the river-traffic of the country; but whether it was founded by a common resolve of the Latin confederacy, or by the enterprise of an individual chief, is beyond the reach even of conjecture. The date fixed upon for the commencement of the city, by the formation of the *Pomærium*, viz., 21st April 753 B.C., is, of course, perfectly valueless in its precision. We know and can know nothing whatever on the point. The three 'tribes,' Ramnians, Tities, and Luceres, who appear in the Romuleian legend, as the constituent parts of the primitive commonwealth, suggest the idea that R. (like Athens) arose out of a *synoikismos* or amalgamation of three separate cantons; but Mommsen rejects as 'irrational' the common opinion that these cantons represent different races, and that the Romans were a 'mongrel people,' made up of Latins, Sabines, and Etruscans, with perhaps a dash of Hellenic and imaginary 'Pelagic' blood in their veins! The existence of a Sabine element, represented by the Tities, is indeed admitted; but its introduction is thrown back to a period long anterior to the foundation of the city, when the Roman clans were still living in their open villages, and nothing of R. existed but its 'stronghold' on the Palatine. Nor is there anything to indicate that it materially affected the Latin character, language, polity, or religion of the commonwealth which was subsequently formed.

The motives which probably led to the building of R., also led to its rapid development, so that the great peculiarity of the Roman, as compared with the other Latin cantons, is the prominence which its urban life assumed in the earliest period. No doubt the Roman continued to manage his farm in the cantonal territory, but the insalubrity of the Campagna, as well as the advantages of river-traffic, and the necessity for watchfulness imposed upon all frontier towns in rude ages, must ever have acted as an inducement to him to take up his residence as much as possible in the city. The consequence was that the Roman became essentially a 'citizen,' while the other Latins remained essentially 'rustics.' So markedly is this the case, that the beginnings of Roman history—if the ancient legend may be so designated—are mainly records of its urban expansion and political growth. That the Palatine Hill was the oldest portion of the city is attested by a variety of circumstances. Not only does it hold that rank in the Romuleian legend, but on it were situated the oldest civil and religious institutions. The Romuleian myth of the establishment of an asylum on the Capitoline (see *CAPITOL*) for homicides and runaway slaves, with all its famous consequences—the *Rape of the Sabine Women*, the wars with the Latins of Canina, Antemnae, and Crustumium, but especially with the Sabines of Cures under their king Titus Tatius, the tragic fate of Tarpeia, and the fine feminine valor of the ravished maidens, who had learned to love their captors, is historically worthless; except, perhaps, so far as it shows us how from the beginning the Roman burghers were engaged in constant feuds with their neighbors for the aggrandizement of their power. The entire history of the 'regal period,' in fact, has come down to us in so mythical and legendary a form, that we cannot feel absolutely certain of the reality of a single incident. That such personages as Numa Pompilius, Tullus Hostilius, Ancus Martius, Lucius Tarquinius Priscus, Servius Tullius, and Lucius Tarquinius Superbus, ever existed, or, if they did, that the circumstances of their lives, their institutions, their conquests, their reforms, were as the ancient narrative describes them, are things which no critical scholar can believe.

The destruction of the city records by the Gauls, when they captured and burned R. in the 4th c. B.C., deprived the subsequent chroniclers of authentic information in regard to the past, and forced them to rely upon treacherous reminiscences, on oral tradition, on ballads, and on all the multifarious fabrications of a patriotic fancy, that would naturally seek compensation for political disaster in the splendor with which it would invest its

* It is perhaps hardly necessary to remark that the story of the foundation of Alba Longa by Ascanius, the son of Æneas, and the introduction of a Tyrrhenian Trojan element into the primitive history of Latium, is an utterly worthless fable.

primeval history. The utmost reach, therefore, to which our knowledge can attain, is to form some general idea—mainly by inference from the institutions that we find existing in later times—of the course that social and political progress followed in the Roman commonwealth.

From the very beginning of the city—and probably long before—the inhabitants were divided into two orders (exclusive of ‘slaves’)—viz., householders and their dependants, better known perhaps as ‘patricians’ (from *pater*, a father) and ‘clients’ (i. e., ‘listeners’ from *cluere*, ‘to listen’). The former alone possessed political—i. e., burgess-rights. It was they who exclusively constituted the *populus* (‘the people’); while the clients had no political existence whatever. How this latter class originated we do not know, but ‘superiors’ and ‘inferiors’ exist everywhere, and there is really nothing wonderful in the phenomena, except the rigor of their political subjection. In a thriving community like the Roman, which seems to have always held a somewhat isolated and antagonistic position to the other Latin cantons, newcomers, such as refugees and the like, would be frequent; and these alien settlers, it is clear, never obtained (except under very special circumstances) the privileges of the original Roman families. That the clients formed a body essentially different from the *plebs*, is not true, and seems based merely on the mythical account of what followed the destruction of Alba Longa by Tullus Hostilius.

The name *plebs* (i. e., ‘the multitude,’ from the same root as *pleo*, I fill, *plenus*, full; with which is perhaps connected the other Latin word *vulgus*, Eng. *folk*), is doubtless, as its signification indicates, of later origin than *clientes*; but both are applicable to the same persons, who were called ‘listeners,’ in reference to their being dependants on the different burgess-households, and the ‘multitude,’ in reference to their want of political rights. The constitution of the state was simple. All the burgesses were politically on a footing of equality. From their own ranks was chosen the king or ‘leader’ (*rex*), who was therefore nothing more than an ordinary burgess—a husbandman, a trader, a warrior, set over his fellows. But it must at the same time be observed, that his authority was great, for the Roman state was based on the Roman household, and something of the absoluteness of the *patria potestas* appears in the uncircumscribed nature of the regal powers. The *rex* held his office for life; he consulted the national gods; he appointed the priests and priestesses; he called out the *populus* for war, and led the army in person; his command (*imperium*) was not to be gainsayed, on which account on all official occasions he was preceded by ‘messengers’ or ‘summoners’ (*lictors*, from *licere* ‘to summon,’ though commonly given from *ligo*, ‘to bind’), bearing the ‘fascēs’ (axes and rods tied up together), the symbols of power and punishment; he had the keys of the public chest, and he was the supreme judge in all civil and criminal suits. The Roman religion or *cultus* was from the first thoroughly subordinate to the authority of the state; and all that we can infer from the myth of Numa is that R. perhaps owed its colleges of augurs and pontiff to the wisdom of some enlightened sovereign who felt himself at times embarrassed in his decisions on matters of religious and public law, and recognized how valuable might be the aid afforded him by a body of sacred experts. We may rest certain that originally the sole power was the regal, and that the subordinate magistracies found at a later time arose from a delegation of regal authority, rendered necessary by the ceaseless increase of state-business.

‘All the officials of the earliest period,’ says Mommsen (who has expounded this view with admirable sagacity in his chapter on the “Original Constitution of Rome”), ‘the ordinary city-warden (*praefectus urbi*, who doubtless governed in the absence of the *rex*), as well as those who were probably nominated regularly the “trackers of foul murder” (*questores parricidii*), and the “leaders of division” (*tribuni*, from *tribus*, part) of the infantry (*militēs*), and of the cavalry (*celerēs*), were mere royal commissioners and not magistrates in the subsequent sense of the term.’ On the other hand, we may believe that the *senatus*, or Council of the Elders, from its very nature, was as old an institution as the monarchy itself. Among the very first things the ‘citizen-king’ would do, would be to choose out of the ranks of his fellow-burgesses a number of experienced men to assist him with their counsel; but it is to be observed that this body possessed no coercive or constraining powers. They gave their advice when the *rex* chose to ask it; that was all. Yet as the tenure of their office was for life, they necessarily possessed great moral authority; and it was only when the king, the senate, and the community were at one in regard to any important matter—a war, for example—that it was held to be righteous and likely to be favored by the gods. The burgesses, or householders, were divided into *curiae*—i. e., ‘wardships,’ connected probably with *cura* and *curare*, ‘to care for,’ rather than with *curis*, and the Sabine *cures*, as Varro thinks. Ten households formed a *gens* (a ‘clan’ or ‘family’); 10 clans, or 100 households, formed a *curia*, or wardship; and 10 wardships, or 100 clans, or 1000 households, formed the *populus*

civitas, or community. But as Rome was a *synoikismos* of three cantons, the actual number of wards was 30, of clans 300, and of households 3000. Every household had to furnish one foot-soldier (hence the name *mil-es*, the ‘thousandth walker,’ from *mil*, and *eo* (?) ‘to go’), and every clan a horseman and a senator. Each ward was under the ‘care’ of a special warden (the *curio*), had a priest of its own (the *flamen curialis*), and celebrated its own festivals. None but burgesses could bear arms in defence of the state (hence their designation, *populus*, ‘the warrior body,’ connected with *populari*, ‘to lay waste,’ and *popa*, ‘the priest, or priest’s assistant, who felled the victim at the altar—the sacred butcher’).

In the old litanies the blessing of Mars is invoked upon the *pilumnus poplus* (‘the spear-armed warrior-body’), and when the *rex* addressed them, it was by the name of *quirites* (‘lancemen,’ from *quiris*, or *curis*, a ‘lance,’ and *eo*, ‘to go’). The original Roman army, or *legio* (i. e., ‘the gathering’), was composed of three ‘hundreds’ (*centuriae*) of horsemen (*celerēs*—i. e., ‘the swift,’ or *flexantes*, ‘the wheelers’), under their divisional leaders (*tribuni celerum*); and three ‘thousands’ of footmen (*militēs*), also under divisional leaders (*tribuni militum*), to whom were added a number of light-armed skirmishers (*pelites*), especially ‘archers’ (*arquites*). The *rex*, as we have said, was usually the general, but as the cavalry force had a colonel of its own (*magister equitum*), it is probable that he placed himself at the head of the infantry. Military service was no doubt the prime duty of the Roman burgesses, but the king could impose upon them any labors that he reckoned necessary or advantageous to the welfare of the state, such as the erection of public edifices, the tilling of the royal demesnes, the execution of royal commissions, or the building of the city walls.

The ‘foreign policy’ of R. seems to have been aggressive from the first, and this character it retained as long as the aggrandizement of the state was possible. We have, it is true, no certain knowledge of the primitive struggles in which the enterprising and ambitious Roman burgesses were engaged, but it appears from the legend that at a very early period the neighboring Latin communities of Antennæ, Crustumium, Ficulea, Medulla, Cænina, Corniculum, Cameria, Collatia, were subjugated. The crisis of the Latin War, however, was undoubtedly the contest with Alba Longa, in which that ‘sacred metropolis’ of Latium was destroyed, and its leadership passed to the conqueror. How deadly the struggle between the two was, may be inferred from the tragic details in which the legend abounds. As a rule, on the subjugation of a canton, the conquered inhabitants were allowed to remain in their open hamlets, but their *capitolium* was razed, their weekly market, their justice-court, their gods—everything, in short, strictly national—were removed to R., while they themselves were enrolled among the clients or *plebs*. But sometimes the inhabitants themselves, in whole or part, were transferred to R., and individuals or clans were even received into the ranks of the Roman burgesses, as in the case of Alba Longa.

Some of the famous Roman *gentes* claimed to be of Alban descent—the Julii, Servilii, Quinctilii, Cloelii, Gegani, Curiatii, and Metilii. The wars with the Etruscans of Fidenæ and Veii—assigned, like the destruction of Alba Longa, to the reign of Tullus Hostilius—were apparently indecisive; those with the Rutuli and Volsci, however, were probably more fortunate; but uncertainty hangs like a thick mist over the ancient narrative. Even the story of the Tarquins, though it belongs to the later period of the monarchy, is in many of its details far from credible. Both Niebuhr and Mommsen consider ‘Tarquin the Proud’ a historical personage, and without accepting literally all the circumstances of the tradition, believe the general outline—his character, his exactions, his expulsion, and his desperate efforts for the recovery of the throne—to be trustworthy. The memory of such a monarch was likely to be preserved by the very strength of the hatred he excited, and an act so daring as his expulsion (which was at the same time the death-knell of a system of government that had prevailed for ages) could hardly be a mere invention, though it might be overlapped with fold upon fold of picturesque fiction. The view taken by Napoleon III. (see *Histoire de Jules César*, vol. i.), that the primitive monarchy had served its purpose, and had consequently to disappear, is perhaps not so erroneous as the oracular language of the imperial author would lead us to suppose. The aristocracy or *populus* had become so much more powerful than the individual *rex*, that they wished to possess *de jure* as well as *de facto* the supreme authority. The pride and tyranny of a Tarquin may very well have aided in furthering their designs.

Meanwhile a great internal change had taken place in Rome. This is usually designated the Servian ‘Reform of the Constitution,’ although the expression is calculated to mislead. There was nothing directly political in the ‘reform.’ It was only a reform in the burgess-levy—i. e., in the mode of raising the army. Formerly, as we have seen, none but burgesses could bear arms in defence of the state; but the increase of the general popula-

tion, caused partly by the annexation of the conquered Latin communities, and partly by time, had totally altered the relation in which the non-burgesses, or *plebs*, originally stood to their political superiors. The *plebs* could, of course, acquire property and wealth, and could bequeath it just as legally as the *populus*; moreover, such of the Latin settlers as were wealthy and distinguished in their own communities, did not cease to be so when they were amalgamated with the Roman 'multitude.' It was therefore felt to be no longer judicious to let the military burdens fall exclusively upon the old burgesses, while the rights of property were equally shared by the non-burgesses. Hence the new arrangement, known in Roman history as the formation of the *Comitia Centuriata*. When or with whom the change originated, it is impossible to say. The legend assigns it to Servius Tullius, predecessor of Tarquin the Proud; and it was in all probability the work of some kingly ruler who saw the necessity of reorganizing the national forces. That it cannot be regarded as a change brought about by party-zeal, is obvious when we reflect that it conferred no rights, but only imposed duties on the plebeians. Its details were briefly as follows: Every Roman freeholder from the age of 17 to 60, whether patrician or plebeian, was made liable to serve in the army; but he took his place according to the amount of his property.

The freeholders were distributed into five *classes* (i. e., 'summonings,' from *calare*, to 'summon' or 'call out'), and these *classes*, all of whom were infantry, were again subdivided into *centuriæ* ('hundreds'). The first class, which required to possess property valued at 100,000 ases, or an entire hide of land, furnished 82 'hundreds'; the second, property valued at 75,000 ases, or $\frac{2}{3}$ ths of a hide of land, furnished 20 'hundreds'; the third, property valued at 50,000 ases, or $\frac{1}{2}$ hide of land, furnished 20 'hundreds'; the fourth, property valued at 25,000 ases, or $\frac{1}{4}$ th hide of land, furnished 20 'hundreds'; and the fifth, property valued at 12,500 ases, or $\frac{1}{8}$ th hide of land, furnished 32 'hundreds.' A single 'hundred' was, moreover, added from the ranks of the non-freeholders, or *proletarii* (were 'children-begetters'), although it is possible that from the same order came the two 'hundreds' of 'horn-blowers' (*cornicines*), and 'trumpeters' (*tibicines*), attached to the fifth class. Thus the infantry 'hundreds' amounted 175, that is, 17,500 men, besides whom were 18 'hundreds' of *equites* ('horsemen') chosen from the wealthiest burgesses and non-burgesses; so that the Roman army now numbered in all nearly 20,000 men. We have stated that the original design of this new arrangement was merely military, but it is easy to see that it would soon produce political results. Duties and rights are correlative. The former suggest the latter, and create a desire for their attainment. Hence the Servian military reform paved the way for the grand political struggle between the patricians and the plebeians, which commenced with the first year of the Republic, and only terminated with its dissolution.

The Roman Republic from its Institution to the Abolition of the Decemvirate.—1. *Internal History.*—According to the legend, the expulsion of the Tarquins was mainly the work of their cousins, Junius Brutus and Tarquinius Collatinus, in revenge for the outrage on the honor of Lucretia, and was followed by the abolition of the monarchy. The date usually assigned to this event is 509 B.C. The story is intensely tragical, and if we must consider it poetry rather than fact, yet it may safely be taken as evidence that it was an unbridled lust of power and self-gratification that brought ruin on the Romano-Tuscan dynasty. Of course, we can make nothing definite out of the early years of the republic. Dates and names, and even events, must go for very little. Valerius Publicola or Poplicola, Sp. Lucretius, M. Horatius, Lars Porsenna (q. v.) of Clusium, Aulus Postumius, with the glorious stories of Horatius Coclès and the battle of Lake Regillus, will not bear to be scrutinized. We must content ourselves with the knowledge of historical tendencies and general results. The change from 'kings' to 'consuls' (*consules*, 'those who leap together'—more generally, those who act together) was not intended to diminish the administrative power of the supreme rulers, but only to deprive them of the opportunity of doing harm—of becoming Tarquins; and this it effectually succeeded in doing, by limiting their tenure of office to a year, and by numerous other restrictions. (For an account of their original functions, and of the subsequent modifications which these underwent, see *CONSUL*.) It is believed to have been about this time, and in consequence of the new political changes, that the old assessors of the king, such as the *quaestores parricidii*, formally became standing magistrates instead of mere honorary counsellors, and also that the priesthood became a more self-governing and exclusive body. During the regal period the priests were appointed by the king, but now the colleges of augurs and pontiffs began to fill up the vacancies in their ranks themselves, while the vestals and separate 'flamens' were nominated by the pontifical college, which chose a president (*pontifex maximus*) for the purpose.

The lapse of years ever increasing the quantity of sacred lore,

also increased its importance, and the importance of those who specially studied it; and nothing comes out more clearly in the early history of the republic than the fact, that the opinions of the augurs and pontiffs became more and more legally binding. This is to be connected with the fact, that in every possible way the patricians or old burgesses—now rapidly becoming a mere *noblesse*—were seeking to rise on the ruins of the monarchy, and to preserve separate institutions for the benefit of their own order, when they could with difficulty longer exclude the *plebs* from participation in common civic privileges. In the details given us of the 'Servian Reform,' we can easily discern a spirit of compromise, the concessions made to the plebeians in the constitution and powers of the *Comitia Centuriata* being partially counter-balanced by the new powers conferred on the old burgess body, the *Comitia Curiata*—viz., the right of confirming or rejecting the measures passed in the Lower Assembly. Towards the new assembly, therefore, it stood somewhat in the relation in which the House of Lords stands to the House of Commons, but the analogy must not be pushed too far; it is only general. The character of the senate altered under the action of the same influences. Although it never had been formally a patrician body—although admission to it under the kings was obtainable simply by the exercise of the royal prerogative, yet, practically, 299 out of the 300 senators had always been patricians; but after the institution of the republic, we are told that the blanks in the senate were filled up *en masse* from the ranks of the plebeians, so that of the 300 members less than half were *patres* ('full burgesses'), while 164 were *conscripti* ('added to the roll'), hence the official designation of the senators *patres et conscripti* ('full burgesses and enrolled').

As yet, however, it is to be observed the plebeians were rigorously excluded from the magistracies. They could vote—i. e., they could exercise legislative powers—but they had no share in the administration. None but patricians were eligible for the consulship, for the office of quaestor, or for any other executive function, while the priestly colleges rigidly closed their doors against the new burgesses. The struggle, therefore, between the two orders went on with ever-increasing violence. One point comes out very clearly from the narrative, however dubious we may be of the particular details, viz., that the establishment of the republic and the reconstitution of the burgess body, instead of allaying discontent, only fostered it. Power virtually passed into the hands of the capitalists, and though some of these were plebeians, yet they would seem to have preferred their personal money-interests to the interests of their order, and to have co-operated with the patricians. The abuse by these capitalists of the *Ager Publicus*—that is, such portion of the land of a conquered people as had been taken from them, annexed to the Roman state, and let out originally to the patricians at a fixed rent (see *AGRARIAN LAW*), together with the frightful severity of the law of debtor and creditor, the effect of which was all but to ruin the small plebeian 'farmers,' who constituted, perhaps, the most numerous section of the burgesses—finally led to a great revolt of the plebs, known as the 'Secession to the Sacred Hill,' the date assigned to which is 494 B.C. On that occasion the plebeian farmer-soldiers, who had just returned from a campaign against the Volscians, marched in military order out of Rome, under their plebeian officers, to a mount near the confluence of the Anio with the Tiber, and threatened to found there a new city, if the patricians did not grant them magistrates from their own order; the result was, the institution of the famous plebeian tribunate (see *TRIBUNE*)—a sort of rival power to the patrician *consulate*, by means of which the plebeians, at least, hoped to be shielded from the high-handed oppressions of the wealthy. To the same period belongs the institution of the *EDILES* (q. v.). A little later, the *Comitia Tributa* emerged into political prominence. This was really the same body of burgesses as formed the *Comitia Centuriata*, but with the important difference, that the number of votes was not in proportion to a property classification.

The poor plebeian was on a footing of equality with the rich patrician; each gave his vote, and nothing more. Hence the *Comitia Tributa* virtually became a plebeian assembly, and when the *plebiscita* ('Resolutions of the plebs' carried at these *comitia*) acquired (as they did by the Valerian Laws passed after the abolition of the Decemvirate) a legally binding character, the victory of the 'multitude' in the sphere of legislation was complete. From this time the term *populus* practically, though not formally, loses its exclusive significance; and when we speak of the Roman citizens, we mean indifferently patricians and plebeians. The semi-historical traditions of this period—for we are now (5th c. B.C.) beginning to emerge out of the mythical era—unmistakably show that the institution of the tribunate led to something very like a civil war between the two orders. Such is the real significance of the legends of Caius Marcus, surnamed *Coriolanus* (q. v.); the surprise of the Capitol by the Sabine marauder, Appius Herdonius, at the head of a motley force of political outlaws, refugees, and slaves; the migrations of numerous Roman burgesses

with their families to more peaceful communities; the street-fights; the assassinations of plebeian magistrates; the annihilation by the Etruscans of the Fabian gens, who had left R. to escape the vengeance of their order for having passed over to the side of the plebeians; and the atrocious judicial murder of Spurius Cassius, an eminent patrician, who had also incurred the deadly hatred of his order, by proposing an agrarian law that would have checked the pernicious prosperity of the capitalists and overgrown landholders. Finally, 462 B.C., a measure was brought forward by the tribune C. Terentilius Urso, to appoint a commission of ten men to draw up a code of laws for the purpose of protecting the plebeians against the arbitrary decisions of the patrician magistrates.

A fierce, even a frantic opposition was offered by the patricians, and the ten years that followed were literally a period of organized anarchy in Rome. At length the nobles gave way, and the result was the drawing up of the famous code known as the *Twelve Tables*—at first *Ten*, to which two were afterwards added—the appointment of the DECENVIRI (q. v.), and the abolition of all the ordinary magistrates, both patrician and plebeian. The government by decenvirs, however, lasted only two years; according to tradition, the occasion of its overthrow was the attempt of the principal decemvir, Appius Claudius (q. v.) to possess himself by violence of the beautiful daughter of Virginius, a Roman centurion; but the real cause was doubtless political, though the cruel lust of a Claudius may have afforded the occasion; the result of which was the restoration of the predecemviral state of things—the patrician consulate and the plebeian tribunate.

2. *External History.*—The external history of R., from the establishment of the republic to the abolition of the decemvirate, is, it need hardly be said, purely military. The Romans fought incessantly with their neighbors. Long before the close of the regal period they had acquired, as we have seen, the leadership of Latium, and in all the early wars of the republic they were assisted by their allies and kinsmen; sometimes also by other nations—as, for example, the Hernicans, between whom and the Romans and Latins a league was formed by Spurius Cassius in the beginning of the 5th c. B.C. The most important of these wars were those with the southern Etruscans, especially the Veientes, in which, however, the Romans made no way, and even suffered terrible disasters, of which the legend concerning the destruction of the Fabian gens on the Cremera (477 B.C.) may be taken as a distorted representation; the contemporaneous wars with the Volscians, in which Coriolanus is the most distinguished figure; and those with the Æqui (458 B.C.), to which belongs the fine legend of Cincinnatus (q. v.).

From the Abolition of the Decemvirate to the Defeat of the Samnites, and the Subjugation of all the 'Italians' (449–265).—1. *Internal History.*—The leading political features of this period are the equalization of the two orders, and the growth of the new aristocracy of capitalists. After the abolition of the decemvirate, it would seem—judging from the course of events—that the whole of the plebeian aristocracy, senators and capitalists (from motives of selfish aggrandizement), combined with the 'masses' of their order to make a series of grand attacks on the privileges of the old Roman noblesse. The struggle lasted for 100 years; and ended, as it could only end, by the removal of all the social and political disabilities under which the plebeians had labored—though the stratagems and artifices to which the old aristocracy had recourse, proved the reluctance with which they succumbed to fate. First in 445 B.C., only four years after the fall of all the decenvirs was carried, the *Lex Canuleia*, by which it was enacted that marriage between a patrician and plebeian should be legally valid. At the same time, a compromise was effected with respect to the consulship. Instead of two patrician consuls, it was agreed that the supreme power should be intrusted to new officers termed 'Military Tribunes with Consular Power,' who might be chosen equally from the patricians or plebeians. Ten years later (435 B.C.), the patricians tried to render the new office of less consequence by the transference of several of the functions hitherto exercised by consuls to two special patrician officers named *Censors* (q. v.). The 'censorship,' Mommsen remarks, 'gradually became the palladium of the aristocratic party, less on account of its financial influence, than for the sake of the right annexed to it of filling up vacancies in the senate and in the equites.' In 421 B.C., the quaestorship (see *QUÆSTOR*) was thrown open to the plebeians; in 368 B.C., the mastership of the horse; in 356 B.C., the dictatorship (see *DICTATOR*); in 351 B.C., the censorship; in 337 B.C., the pretorship (see *PRÆTOR*); and in 300 B.C., the pontifical and augural colleges. These victories were not all won without the shedding of blood. How great was the exasperation of the patricians may be estimated from the story of Spurius Maelius, the rich plebeian, who was murdered simply because in a season of famine he sold corn at a very low price to the poor.

The only effect, it is to be observed, of these political changes was to increase the power of the rich plebeians; and consequently, the social distress continued to show itself as before. No gen-

uine national concord was possible so long as that remained unmitigated. Efforts were repeatedly made by individuals to remedy the evil, but without success. Such were the attempts of the tribunes Spurius Maelius and Spurius Metilius (417 B.C.) to revive the agrarian law of Spurius Cassius; and of the noble and patriotic patrician, Marcus Manlius, who, though he had saved the Capitol during the terrible Gallic siege, was hurled from the Tarpeian Rock (384 B.C.), on the customary charge, as groundless in his case as it was base, of aspiring to the monarchy; but at length (367 B.C.), after a furious struggle of eleven years, the famous Licinian Rogations (see *AGRARIAN LAW*) were carried, by means of which it was hoped that an end had been put to the disastrous dissensions of the orders. Thus, at least, we interpret the act of the dictator Camillus, who raised a temple to the goddess *Concord*, at the foot of the Capitol.

That these laws operated beneficially on the class in whose interest they were passed, viz., the plebeian-farmers or middle-class of the Roman state, is unquestionable; but events proved that they were inadequate to remedy the evil, and after a time they ceased to be strictly enforced. On the other hand, there can be as little doubt that, owing partly to these changes, and still more to the splendid and far-reaching conquests achieved in Italy during this period of internal strife by the Roman arms, the position of the plebeian farmer was decidedly raised. Not only were the 'general coffers filled' by the revenue drawn directly or indirectly from the subjugated lands, so that a *tributum* (a forced loan) seldom required to be enforced at home, but the numerous colonies which R. now began to send forth to secure her new acquisitions, consisted entirely of the poorer plebeians, who always received a portion of the land in the district where they were settled.

The long struggle between the two orders was thus virtually at an end; but the date usually assigned to the termination of the strife is 286 B.C., when the *Lex Hortensia* was passed which confirmed the Publilian Laws of 339 B.C., and definitely gave to the *Plebiscita* passed at the Comitia of the Tribes, the full power of laws binding on the whole nation. Gradually, however, by steps which we have not room to trace, the importance of the popular assemblies declined, and that of the senate rose. This was owing mainly to the ever-increasing magnitude of the Roman state, and to the consequent necessity of a powerful governing body. The senate, it will be remembered, originally possessed no administrative power at all, but now it commenced a series of vast usurpations of which the best defence is that they excited no opposition among the community. Every matter of general importance—war, peace, alliances, the founding of colonies, the assignment of lands, building, the whole system of finance—came under its supervision and authority. Nor, on the whole, did it prove itself the unworthy arbiter of a nation's destinies. It was not a self-elected oligarchy, but was rather composed of the ablest representatives of both orders.

2. *External History.*—We have said that the military successes of R. during this period of internal strife were great; but we can only briefly allude to them. The irruption of the Gauls into sub-Apennine Italy (391 B.C.), though accompanied by frightful devastations, was barren of results, and did not materially affect the progress of Roman conquest. No doubt the battle on the Allia, and the capture and burning of R. (390 B.C.), were great disasters, but the injury was temporary. The vigilance of Manlius saved the Capitol, and the heroism of Camillus revived the courage and spirit of the citizens. Again and again in the course of the 4th c. B.C., the Gallic hordes repeated their incursions into Central Italy, but never again returned victorious. In 367 B.C., Camillus defeated them at Alba; in 360 B.C., they were routed at the Colline Gate; in 358 B.C., by the dictator, G. Sulpicius Peticus; and in 350 B.C., by Lucius Furius Camillus. Meanwhile, aided by their allies, the Latins and the Hernicans, the Romans carried on the long and desperate struggle with the Æquians, Volscians, and Etruscans. Finally, but not till after they had sustained repeated defeats, the Romans triumphed.

The causes that led to the decline of the Etruscan power, which at the close of the regal period in R., and during the infancy of the republic, had been enormous, both by sea and land, cannot be considered at length here. Suffice it to say, that the terrible irruption of the Gallic barbarians into Etruria, and the victories of the Samnites in Campania, where also the Etruscans had established themselves, as well as the miserable jealousies of the different cities, combined to paralyze the power of this people, and paved the way for the final triumph of Rome. But even before the Gauls had crossed the Apennines, the fate of Etruria was virtually sealed. The fall of Veii (q. v.), 396 B.C., was really the death-knell of Etruscan independence. Although the story has undoubtedly descended to us in a mythical dress, the siege of Veii is by no means to be placed in the same category with the siege of Troy, albeit, like it, it is said to have lasted ten years. Falerii, Capena, and Volturni—all sovereign cities of Etruria—hastened soon after to make peace, and by the middle of the 4th.

c., B.C., the whole of Southern Etruria had submitted to the supremacy of R., was kept in check by Roman garrisons, and denationalized by the influx of Roman colonists. In the land of the Volsci, likewise, a series of Roman fortresses were erected to overawe the native inhabitants; Velitrae, on the borders of Latium, as far back as 492 B.C., Suessa Ponetia (442 B.C.), Circeii (393 B.C.), Satricum (385 B.C.), and Setia (382 B.C.): besides the whole Volscian district, known as the Pontine Marshes (q. v.), was distributed into farm-allotments among the plebeian soldiery. Becoming alarmed, however, at the increasing power of Rome, the Latins and Hernicans withdrew from the league, and a severe and protracted struggle took place between them and their former ally. Nearly thirty years elapsed before the Romans succeeded in crushing the malcontents, and restoring the league of Spurius Cassius. In the course of this war, the old Latin confederacy of the 'Thirty Cities' was broken up (384 B.C.) probably as being dangerous to the hegemony (now rapidly becoming a supremacy) of R., and their constitutions were more and more assimilated to the Roman. The terms of the treaty made by the Romans (348 B.C.) with the Carthaginians show how very dependent was the position of the Latin cities. Meanwhile, the Romans had pushed their garrisons as far south as the Liris, the northern boundary of Campania. Here they came into contact with the Samnites (q. v.), a people as heroic as themselves, their equals in everything but unity of political organization; perhaps their superiors in magnanimity.

The Samnites had long been extending their conquests in the south of Italy, just as R. had in the center and in Etruria. Descending from their native mountains between the plains of Apulia and Campania, they had overrun the lower part of the peninsula, and under the name of Lucanians, Bruttians, &c., had firmly established themselves, threatening everywhere the prosperity of the Greek and Etruscan possessions in those regions. But it was the dwellers in the original mountain territory who properly bore the name of Samnites, and between them and the Romans now commenced a tremendous struggle; the former fighting heroically for the preservation of their national freedom—the latter warring with superb valor for dominion. We cannot afford space to recount the circumstances that brought about the collision, further than to state that the Samnite colonies had in the course of time become so detached in sympathy, and so changed in character and interests from the parent stock, as almost to forget their original unity. Hence, hostilities were common between them; and the forays of the Samnite Highlanders in the rich lowlands of Campania were dreaded above all things by their more polished but degenerate kinsmen of Capua, who had acquired the luxurious habits of the Greeks and Etruscans. It was really to save themselves from these destructive forays that the Campanians offered to place themselves under the supremacy of R.; and thus Romans and Samnites were thrown into a position of direct antagonism. The Samnite Wars, of which three are reckoned, extended over 53 years (343—290 B.C.). The second, generally known as the 'Great Samnite War,' lasted 22 years (326—304 B.C.). At first, the success was mainly on the side of the Samnites; and after the disaster at the *Caudine Forks* (q. v.), it seemed as if Samnium and not R. was destined to become the ruler of Italy, but the military genius of the Roman consul, Quintus Fabius Rullianus (see *FABIUS*), triumphed over every danger, and rendered all the heroism of Caius Pontius, the Samnite leader, unavailing.

In 304 B.C., Bovianum, the capital of Samnium, was stormed and the hardy Highlanders were compelled to acknowledge the supremacy of the republic. The third war (298—290 B.C.) was conducted with all the sanguinary energy of despair; but though the Etruscans and Umbrians now joined the Samnites against the Romans, their help came too late. The victory of Rullianus and of P. Decius Mus, and Sentinum (295 B.C.), virtually ended the struggle, and placed the whole of the Italian peninsula at the mercy of the victor. It only remains to be mentioned here that at the close of the first Samnite War, which was quite indecisive, an insurrection burst out among the Latins and Volscians, and spread over the whole territory of these two nations; but the defeat inflicted on the insurgents at Trifanum (340 B.C.) by the Roman consul, Titus Manlius Imperiosus Torquatus, almost instantly crushed it, and in two years the last spark of rebellion was extinguished. The famous Latin league was now dissolved; many of the towns lost their independence and became Roman *municipia*; new colonies were planted both on the coast and in the interior of the Latino-Volscian region; and finally, so numerous were the farm-allotments to Roman burgesses, that two additional tribes had to be constituted.

From the Close of the Samnite to the Commencement of the Punic Wars.—The war with Pyrrhus (q. v.), king of Epirus, which led to the complete subjugation of Peninsular Italy, is a sort of pendant to the great Samnite struggle. It was brought about in this way. The Lucanians and Bruttians, who had aided the Romans in the Samnite Wars, considering themselves cheated of their portion of the spoil, entered into negotiations with the ene-

mies of their former associate throughout the peninsula. A mighty coalition was immediately formed against R., consisting of Etruscans, Umbrians, and Gauls in the north, and of Lucanians, Bruttians, and Samnites in the south, with a sort of tacit understanding on the part of the Tarentines that they would render assistance by and by. The rapidity with which it took shape shows alike the fear and the hatred inspired by the Roman name.

In the course of a single year, the whole north was in arms, and once more the power, and even the existence of R., were in deadly peril. An entire Roman army of 13,000 men was annihilated at Arretium (284 B.C.) by the Senonian Gauls, but that dauntless spirit which the republic never failed to display in the crisis of its fortunes, and which gives a sublime dignity to its worst ambition, now shone out in the fulness of its splendor. Publius Cornelius Dolabella marched into the country of the Senones at the head of a large force, and literally extirpated the whole nation, which henceforth disappears from history. Shortly afterwards the bloody overthrow of the Etrusco-Boian horde at Lake Vadimo (283 B.C.) shattered to pieces the northern confederacy, and left the Romans free to deal with their adversaries in the south. The Lucanians were quickly overpowered (282 B.C.); Samnium, broken by its long and luckless struggle, and overawed by the proximity of a Roman army, could do nothing. A rash and unprovoked attack on a small Roman fleet now brought down on the Tarentines the vengeance of R., at the very moment R. was free to exert all her terrible power. Awakening to a sense of their danger, the Tarentines invited Pyrrhus (q. v.), over from Epirus, and appointed him commander of their mercenaries. This royal adventurer, a man of the most brilliant, but also of the most volatile genius, resembling no modern general so much as Charles Mordaunt, Earl of Peterborough, arrived in Italy (280 B.C.) with a small army of his own, and a vague notion in his head of founding a Hellenic empire in the west, that should rival that created in the east by his kinsman, Alexander the Great. It is not necessary to narrate here the varying fortunes of the struggle between Pyrrhus and the Romans, which lasted only six years, and ended in his being obliged to return to Epirus without accomplishing anything.

After Pyrrhus, baffled in his attempts to check the progress of R., had withdrawn to Greece, the Lucanians and Samnites, whom his reputation and original successes had induced to rise once more against the dreaded foe, continued the unequal struggle, but 'even the bravery of despair,' as it has been said, 'comes to an end; the sword and the gibbet at length (269 B.C.) carried peace even into the mountains of Samnium.' Tarentum had surrendered three years earlier, and now from the Macra and the Rubicon to the Straits of Messina, there was not a nation in Italy that did not acknowledge the supremacy of Rome. Distant kingdoms began to feel that a new power had risen in the world; and when Ptolemy Philadelphus, sovereign of Egypt, heard of the overthrow of the famous Epirote warrior, he sent an embassy to R. (273 B.C.), and concluded a treaty with the republic. To secure their new acquisitions, the Romans established in the south military colonies at Paestum and Cosa, in Lucania (278 B.C.); at Beneventum (268 B.C.), and at Aesernia (263 B.C.), to overawe the Samnites; and in the north, as out-posts against the Gauls, Ariminum (268 B.C.), Firmum in Picenum (264 B.C.), and the burgess colony of Castrum Novum. Preparations were also made to carry the great Applan highway as far as Brundisium, on the Adriatic, and for the colonization of the latter city as a rival emporium to Tarentum.

The political changes were almost as important as the military. The whole population of Peninsular Italy was divided into three classes—1. *Cives Romani*, or such as enjoyed the full burgess privileges of Roman citizens; 2. *Nomen Latinum*—that is, such as possessed the same privileges as had been enjoyed by the members of the quondam Latin league—viz., an equality with the Roman burgesses in matters of trade and inheritance, the privilege of self-government, but no participation in the Roman franchise, and consequently no power to modify the foreign policy of the state; 3. *Socii*, or 'Allies,' to some of whom were conceded most liberal privileges, while others were governed in an almost despotic fashion. The *Cives Romani* no longer embraced merely the inhabitants of the old Roman community, the well-known 'tribes' (of whom there were now thirty-three), but all the old burgess-colonies planted in Etruria and Campania, besides such Sabine, Volscian, and other communities as had been received into the burgess body on account of their proved fidelity in times of trial, together with individual Roman emigrants or families of such, scattered among the *municipia*, or living in villages by themselves. The cities possessing the *Latinum Nomen* included most of the 'colonies' sent out by R. in later times, not only in Italy, but even beyond it; the members of which, if they had previously possessed the Roman franchise, voluntarily surrendered it in lieu of an allotment of land. But any 'Latin' burgess who had held a magistracy in his native town, might re-

turn to R., be enrolled in one of the tribes, and vote like any other citizen. The *Socii* comprised all the rest of Italy, as the Hernicans, the Lucanians, Bruttians, the Greek cities, &c. All national or cantonal confederacies and alliances among the Italians were broken up, and no means were left unemployed by the victors to prevent their restoration.

The Punic Wars.—The origin of Carthage, and the steps by which she rose to power, are sketched in the article *CARTHAGE*. At the time when she came into collision with R. she was indisputably the first maritime empire in the world, ruling as absolutely in the central and western Mediterranean seas as R. in the Italian peninsula. Between the Carthaginians and the Romans there had long existed a nominal alliance—the oldest treaty dating as far back as the 6th c. B.C. But this alliance had never possessed any real significance, and latterly the two nations had come to regard each other with considerable distrust. The incident that occasioned the outbreak was quite trivial, and need not be recorded. Suffice it to say that in 264 B.C., war was formally declared between the two nations, and incomparably the most terrible contest in which R. was ever engaged, began.

We do not propose to follow minutely the course of the famous Punic Wars—the details of which are narrated at sufficient length under the heads *CARTHAGE*, *HAMILCAR*, *HANNIBAL*, *HASDRUBAL*, *HIERO*, *REGULUS*, *METELLUS*, *FABIUS*, *MARCELLUS*, *SCIPIO*, and *NUMIDIA*, to which we refer the reader, but we may briefly indicate their character and result. The wars with Carthage, like those with Samnium, were three in number. The first lasted 23 years (B.C. 264–241), and was waged mainly for the possession of Sicily. Its leading feature was the creation of a Roman navy, which, after repeated and tremendous misfortune, finally wrested from Carthage the sovereignty of the seas. R., indeed, had never been a merely agricultural state, as may be inferred from a variety of particulars—e. g., the antiquity of the galley in the city arms, of the port-dues on the exports and imports of Ostia, and of commercial treaties with transmarine states—but events had hindered it from engaging to any large extent in maritime enterprise; and its shipping, or at least its fleet, was still quite insignificant, although it had become master of nearly all the Italian seaboard. The necessity for a navy now began to show itself. Not only was there a difficulty felt in transporting troops to Sicily, but the shores of the mainland were completely exposed to the ravages of Carthaginian squadrons.

So energetically did the senate set to work, that (we are told) in sixty days from the time the trees were felled, 120 ships were launched, and soon after the consul Caius Duilius gained a brilliant success (260 B.C.) over the Carthaginians off Mylae, on the north-east coast of Sicily. The exultation of the Romans knew no bounds; and the 'triumph' which Duilius received on his return to the city, had more the aspect of a carnival than of a noble ceremony. The *Columna Rostrata* ('Beaked Column') in the Forum preserved for ages the memory of the 'glorious victory.' Subsequent events, however, were less favorable. An invasion of Africa by Regulus (q. v.) ended in disaster, and the war, which was henceforth confined to Sicily, miserably languished. Thrice was the Roman navy annihilated by storms at sea (255 B.C., 253 B.C., and 249 B.C.); and in spite of a series of unimportant successes by land, the Romans long found it impossible to make any impression on the great Carthaginian stronghold of Lilybæum and Drepanum, mainly on account of the brilliant strategy with which they were held in check by Hamilcar Barca, the father of Hannibal. At last, however, a great sea-fight took place off the Ægates isles (242 B.C.), in which a Roman fleet, commanded by the consul Lutatius Catulus, obtained a magnificent victory. The Carthaginian government, whose treasury was empty, and who had in vain tried to raise a state-loan in Egypt, could—for the present—continue the struggle no longer, and the whole of Sicily, except the territory of Hiero of Syracuse, who had been a firm ally of the Romans, passed into the hands of the victors, who constituted it a Roman province, and placed it under the government of a prætor.—A lapse of 23 years occurred before the second Punic War began, but during that interval neither Romans nor Carthaginians had been idle. The former, with worse than 'Punic faith,' had bullied their weak and exhausted rival into surrendering Sardinia and Corsica, which, like Sicily, were transformed into a Roman province. In addition, they had carried on a series of Gallic wars in Northern Italy (231–222 B.C.), the result of which was the complete humiliation of the barbarian Boii, Insubres, &c., and the extension of Italy to its natural boundary—the Alps.

On the eastern coast of the Adriatic also, the Romans made their power felt, by the vigor with which they suppressed Illyrian piracy (219 B.C.). Meanwhile, the descent of Hamilcar on the Spanish coast was followed, after some ineffectual opposition on the part of the natives, by the establishment of a new Carthaginian empire, or at least a protectorate, in the west; and thus, almost before the Romans were aware of it, their hated rival had made good her losses again, and was even able to renew the

struggle in a more daring fashion than before. How confident the bearing of the Carthaginians had now become, may be seen from the fearless spirit in which they accepted the Roman challenge, and entered on the second Punic—or (as the Romans called it) the *Hannibalic*—War, the grand events of which were the crossing of the Alps by Hannibal, the terrible disasters of the Romans at Lake Trasimene (q. v.) and Cannæ (q. v.), and the final overthrow of Hannibal at Zama (q. v.), 202 B.C., by Scipio, which once more compelled the Carthaginians to sue for peace. It was with Carthage as with Samnium. The second war virtually sealed her fate, and the third displayed only the frantic heroism of despair. Her Spanish possessions, like her Sicilian, passed to the Romans (who formed out of them the provinces of *Hispania Citerior* and *Hispania Ulterior*); so did her protectorate over the Numidian sheiks. She was forced to surrender her whole navy (excepting ten triremes), and all her elephants, and to solemnly swear never to make war either in Africa or abroad, except with the consent of her vanquisher. In a word, the imperial supremacy of R. was now as unconditional in the western Mediterranean as on the mainland of Italy. Her relations, indeed, to the conquered Italian nationalities became much harsher than they had formerly been, for, after the first victories of Hannibal, these had risen against her. The Picentes, Bruttii, Apulians, and Samnites, were deprived either of the whole or the greater part of their lands—some communities were actually turned into serfs—the Greek cities in Lower Italy, most of which had also sided with Hannibal, became the seats of burgess-colonies. But the loss of life and of vital prosperity was frightful. 'Numbers of flourishing townships,' says Mommsen, '400 it was reckoned, were destroyed and ruined.'

Slaves and desperadoes associated themselves in robber-bands, of the dangers of which an idea may be formed from the fact that in a single year (185 B.C.) 7000 men had to be condemned for robbery in Apulia alone; the extension of the pastures with their half-savage slave-herdsmen, favored this mischievous barbarizing of the land. But the exultation of victory closed the eyes and the ears of the Romans against every omen, and the perilous work of conquest and subjugation went on. During 201–196 B.C., the Celts in the valley of the Po, who, with the fiery unwisdom of their race, had recommenced hostilities at the very moment R. was freed from her embarrassments, were thoroughly subjugated; their territory was Latinized, but they themselves were declared incapable of ever acquiring Roman citizenship; and so rapidly did their nationality dissolve, that when Polybius, only 30 years later, visited the country, nearly all traces of Celtic characteristics had disappeared. The Boii were finally extirpated about 193 B.C.; the Ligurians were subdued 180–177 B.C.; and the interior of Corsica and Sardinia about the same time. The wars in Spain were troublesome and of longer duration, but they were not at all serious. The natives were indeed perpetually in arms, and the Romans suffered frequent defeats from their sudden and impetuous insurrections; but in the end the superior discipline of the legions always prevailed, and the fiery and chivalrous tribes had of course to make ignominious submission. So little reliance, however, could be placed on these forced submissions, that the Romans felt it necessary to hold Spain by military occupation, and hence arose the first Roman standing armies. Forty thousand troops were maintained in the Spanish peninsula year after year. The most distinguished successes were those achieved by Scipio himself, by Quintus Minucius (197–196 B.C.), by Marcus Cato (195 B.C.), by Lucius Emilius Paulus (189 B.C.), by Caius Calpurnius (185 B.C.), by Quintus Fulvius Flaccus (181 B.C.), and by Tiberius Gracchus (179–178 B.C.).

Macedonian and Greek Wars.—The causes that led to the interference of R. in the politics of the East are too complicated to be given here, but the *Macedonian Wars* were owing immediately to the alliance formed by Philip V. of Macedon with Hannibal after the battle of Cannæ. Like the Samnite and Punic, the Macedonian Wars were three in number. The first (214–205 B.C.) was barren of results, mainly because the whole energies of R. were directed to Spain and Lower Italy; but the second (200–197 B.C.), though it lasted only a third of the time occupied by the first, taught Philip that another and not he must rule in Greece. The battle of *Cynoscephalæ* ('Dogs' Heads' Hills, a range in Thessaly) was followed by a treaty which compelled him to withdraw his garrisons from the Greek cities, to surrender his fleet, and to pay 1000 talents towards the expenses of the war. Philip was thoroughly quelled, and during the remaining 18 years of his life, he adhered (like old Hiero of Syracuse, though less sincerely) to his Roman alliance. But the miserable Ætolians, who had formed an alliance with R. against Philip, with even more stupidity than insolence, quarreled in wanton jealousy with their powerful 'friends,' and persuaded Antiochus (q. v.) of Syria to come over seas to Thessaly, and fight them. A similar fate befell him to what had befallen Philip. After a war of three years, he found himself obliged to surrender all his possessions in Europe and Asia Minor, all his elephants and

ships, and to pay 15,000 Euboic talents (£3,660,000) within 12 years. Next year the Ætolians were crushed, and a little later, the despicable quarrels between the Achaïans and Spartans led to a general Roman protectorate over the whole of Greece.

Philip of Macedon dying (179 B.C.), was succeeded on the throne by his eldest son Perseus (q. v.), who resolved once more to try the fortune of war with the Romans; and in 172 B.C., the third and last Macedonian War began, the result of which, after four years of fighting, was the utter destruction of the Macedonian army at Pydna (168 B.C.) by the Roman consul Lucius Æmilius Paullus (q. v.), the capture of the king, who adorned the triumph of the conqueror, and the dismemberment of the Macedonian empire, which was broken up into four oligarchic republics, the members of which were subjected to severe disqualifications; while in Greece itself, trials and executions for implication in the war of Perseus spread terror everywhere; the conspicuous 'patriots'—i. e., all who had made themselves notorious by their anti-Roman and Macedonian policy—were deported to Italy; further, the imperial republic stopped Antiochus Epiphanes in his career of Egyptian conquest, ordered him instantly to abandon his acquisitions, and accepted the protectorate of Egypt, which the grateful and frightened monarch offered her (168 B.C.). Even the allies of Rome—the Pergamenes, the Rhodians, &c.—were treated with shocking harshness and injustice. We may here, for the sake of connection, anticipate the course of history, and mention the last Greek and Punic Wars. Both of these came to an end in the same year (146 B.C.). The former was caused by an expiring outburst of pseudo-patriotism in the Achaïan League, consequent on the return of the exiles from Rome, and was virtually closed on the siege and destruction of Corinth (q. v.) by the consul Mummius. The latter was not so much a war as a bloody sacrifice to the genius of Roman ambition. After Hannibal's death, his party in Carthage seems to have recovered the ascendancy, and as coincident therewith, the commercial prosperity of the city began to revive, a bolder front was shown in resisting the encroachments of Masinissa, the Numidian ruler, whom the Roman senate protected and encouraged in his aggressions. This was enough. Pierce old Cato only expressed the instinctive sentiment of the Roman burgesses, when he came to utter incessantly *Delenda est Carthago*, and in 149 B.C., the senate adopted his barbarous conviction. After a siege of three years, in which the inhabitants displayed superhuman energy and heroism, Carthage was stormed by Scipio Africanus Minor, and the Carthaginian empire vanished for ever from the earth.

Position of Rome at the Close of the Punic Wars, and sketch of its subsequent Social Condition to the termination of the Republic.—Polybius dates from the battle of Pydna the full establishment of the universal empire of Rome. It was in fact the last battle in which a civilized state confronted Rome in the field on a footing of equality with her as a great power; all subsequent struggles were rebellions or wars with peoples beyond the pale of the Romano-Greek civilization—the barbarians, as they were called. The whole civilized world thenceforth recognized in the Roman senate the supreme tribunal, whose commissioners decided in the last resort between kings and nations; and, to acquire its language and manners, foreign princes and noble youths resided in Rome. But contemporaneous with this enormous extension of power and authority in foreign lands, the national character underwent a complete and fatal alteration. The simplicity and stern integrity of life, the religious gravity of deportment, and the fidelity with which common civic and household duties were discharged—well expressed in the saying of Cato, that it was 'better to be a good husband than a great senator'—which in early times nobly distinguished the Roman burgess, had now all but disappeared. Those hardy virtues—frugality, temperance, justice, and rectitude—which, combined with courage and energy, had given the strength to the nation that made it great, required for their permanence the social conditions out of which they sprang. But the class of peasant proprietors who had laid the foundations of Roman greatness were either extinct or no longer what they once had been. The original causes of their social degradation have been already noticed, and here it is only necessary to say that the victories of R. abroad furthered rather than retarded that degradation. The long and distant wars made it more and more impossible for the soldier to be a good citizen or a successful farmer.

The freedom and licentiousness of camp-life, the sweets of pillage and rapine, ever grew more pleasant to the Italian burgess and colonist; thus indolence, inaptitude, and spendthrift habits, aided the greedy designs of the capitalists, and in most cases the paternal acres gradually slipped into the possession of the great landlords, who found it more profitable to turn them into pasture or cultivate them by gangs of slaves. The rise of the slave-system—though an inevitable result of foreign conquest—was, indeed, the most horrible curse that ever fell on ancient R., and the atrocities inflicted on its unhappy victims are far beyond the possibility of description; Mommson does not exaggerate when he considers it

probable that, 'compared with the sufferings of the Roman slaves, the sum of all negro suffering is but a drop.' If the Italian farmer honorably strove to retain his small farm, he was exposed to the competition of the capitalists who shipped immense quantities of corn from Egypt and other granaries, where slave-labor rendered its production cheap, and of course he failed in the unequal struggle. Not less pernicious was the change that passed over the character of the rich. We have already shown how the old Roman patricians lost their exclusive privileges, how the plebeians gradually acquired a full equality with them; and how the germs of a new social aristocracy originated, based on wealth rather than pedigree, and comprising both plebeians and patricians. During the 4th and 3d centuries B.C., the political power of this order immensely increased. In fact, the whole government of the state passed into their hands. They became an oligarchy, and while it is not to be denied that they displayed extraordinary ability in the conduct of foreign affairs, the vices inseparable from oligarchic rule—selfishness, nepotism, and arrogance, of which Scipio is a striking example—gradually became rampant. Regarding themselves as the Roman community *par excellence*, and the poor burgesses as a mere *canaille*, whose wishes and interests were unworthy of a moment's consideration, they virtually relapsed into the exclusiveness of the ancient *populus*, with this difference for the worse, that their wealth, influence, and pride were a thousandfold greater than those of Coriolanus or Camillus. But far worse than even the nepotism and selfishness of the nobles was their ever-increasing luxury and immorality.

When R. had conquered Greece, and Syria, and Asia Minor, the days of her true greatness were ended. The wealth that poured into the state coffers, thence to be (really if not formally) distributed among the clique of nobles, the treasures which victorious generals acquired, enabled them to gratify to the full the morbid appetites for pleasure engendered by exposure to the voluptuousness of the East. Such results were, it is true, not brought about in a day, nor without a resolute protest on the part of individual Romans. The attitude of Cato Major towards the Hellenizing tendencies of his brother nobles was doubtless patriotic, and posterity has been generous in its laudation of his antique virtue; but Cato Major was nevertheless only a political fanatic and incarnate anachronism. So long as R. chose to subdue foreign nations, and to hold them by the demoralizing tenure of conquest—i. e., as mere *provinces*, whose inhabitants, held in check by a fierce and unscrupulous soldiery (like the Kabyles of Algeria by the French, or, until recently, the Hindus by the British), neither possessed political privileges nor dared cherish the hope of them—it was morally impossible for the citizens, either at home or abroad, to resume the simple and frugal habits of their forefathers. After Cato's time, things grew worse instead of better, nor from this period down to the final dissolution of the empire, was a single radical reform ever permanently effected. The momentary success of Tiberius, and of his far abler brother, Caius Gracchus (q. v.), in their desperate and revolutionary attempts to prevent the social ruin of the state, by breaking down the powers of the senate, redistributing the domain lands, reorganizing the administration, and partially restoring the legislative authority of the popular assemblies, hardly survived their death; and the reaction that ensued proved that the senate, like the Bourbons, could learn nothing from adversity, and that the rabble of the city were incapable of elevation or generosity of political sentiment. Henceforth, the malversation of the public money by prætors and quæstors became chronic, and the moral debauchery of the mob of the capital by the largesses of ambitious politicians and the vile flattery of demagogues, complete.

The old Roman faith, so deep, and strong, and stern, disappeared from the heart. The priests became Pharisees, the nobles 'philosophers' (i. e., unbelievers), their wives practices of oriental abominations under the name of 'mysteries'; while the poor looked on with unmeaning, yet superstitious wonder at the hollow but pompous ceremonies of religion. It would serve no useful purpose to dwell longer on these aspects of Roman society, and we now turn to sketch in a few words the course of outward events to the close of the republic.

From the Destruction of Carthage to the Termination of the Republic.—We have already alluded to the wars waged in Spain during the first half of the 2d c. B.C. The humane and conciliatory policy pursued towards the natives by Tiberius Sempronius Gracchus, father of the ill-fated tribunes, brought about a peace, 179 B.C., that lasted 25 years; but in 153 B.C., a general rising of the Celtiberians took place, followed by another on the part of the Lusitanians of Portugal. The struggle maintained by these gallant barbarians against their mighty oppressor lasted, with intervals of peace, for the space of 20 years, but ended in spite of gleams of brilliant success, as such contests invariably do, in the final overthrow of the undisciplined and uncivilized combatant. All the valor of the shepherd-warrior, Viriathus (q. v.), even if the

assassin's steel had spared his life, would not have prevented the annexation of Lusitania to the Roman empire, nor did the unsurpassable heroism of the besieged Numantines avail to baffle the military skill of the younger Scipio.

Towards the conclusion of the Numantine War occurred the first of those horrible social outbreaks known as 'servile' or 'slave' wars, which marked the later ages of the republic. The condition of the slaves has been already referred to; but what aggravated the wretchedness of their lot was the fact that most of them had been originally freemen—not inferior in knowledge, skill, or accomplishments to their masters, but only in force of character and military prowess. The first slave insurrection broke out in Sicily, 134 B.C., where the system was seen at its worst. Its leader was one Eunus, a Syrian, who, mimicking his native monarch, took the title of King Antiochus. The suddenness and barbaric fury of the revolt for a time rendered all opposition impossible. The slaves overran the island, like demons let loose; and routed one Roman army after another. But a slave insurrection has no aim beyond immediate revenge, and when the first wild paroxysms of ferocity are over, it becomes powerless, more even from a moral than a physical exhaustion, and can be quelled with ease. In 132 B.C., the consul Publius Rupilius restored 'order' in the island. In the East, fortune continued to smile upon the Roman arms. Attalus III., Philometer, a villainous despot of the true oriental stamp, who massacred or poisoned every one that ventured to give him advice, dying 133 B.C., bequeathed his client-kingdom of Pergamum to its protector—R.; and after a fierce struggle with an ambitious pretender called Aristonicus, the Romans obtained possession of the splendid bequest, and formed it into the province of Asia, 129 B.C.

We may here enumerate the different provinces into which the Roman senate divided its foreign conquests, in the order of their organization. 1. Sicily, 241 B.C.; 2. Sardinia and Corsica, 238 B.C.; 3. Hispania Citerior, and 4. Hispania Ulterior, 205 B.C.; 5. Gallia Cisalpina, 191 B.C.; 6. Macedonia, 146 B.C.; 7. Illyricum, circa 146 B.C.; 8. Achaia (or Southern Greece), circa 146 B.C.; 9. Africa (i. e. the Carthaginian territory), 146 B.C.; 10. Asia (kingdom of Pergamum), 129 B.C. A few years later, 118 B.C., an 11th was added by the conquest of the southern part of Transalpine Gaul, and was commonly called, to distinguish it from the rest of the country, 'the Province'; hence the modern *Provence*.

In Africa, the overthrow of Jugurtha (q. v.), 104 B.C., by the consul Marius, added yet further to the military renown and strength of the republic. Meanwhile, from a new quarter of the world, a gigantic and unforeseen danger threatened the Roman state. North of the Alps there had long been roaming in the region of the Middle Danube an unsettled people called the **CIMBRI** (q. v.), whose original home was probably the north-west of Germany. They first came into collision with the Romans in Noricum, 113 B.C.; after which they turned westward, and poured through the Helvetian valleys into Gaul, where they overwhelmed alike the native tribes and the Roman armies. At Aransio (Orange) on the Rhône, 105 B.C., a Roman army of 80,000 was annihilated; but instead of invading Italy, the barbarians blindly rushed through the passes of the Pyrenees, wasted precious months in contests with native tribes of Spain as valiant and hardy as themselves, and gave the Romans time to recover from the effects of their terrible defeat. Marius, who had just returned from his Numidian victories, was reappointed consul; and at Aqua-Sextia (Aix, in Dauphiné), he literally exterminated the dreaded foe, 102 B.C. Next year, near Milan, the same doom befell another northern horde—the Teutones, who had accompanied the Cimbri in their irruption into Spain; but on their withdrawal, had parted from their associates in Gaul, forced their way back through Switzerland, and descended into Italy by the Tyrolean valleys. In the same year a second insurrection of the slaves in Sicily, which had reached an alarming height, was suppressed by the consul Marcus Aquilius.

For the next 10 years the internal history of R. is a scene of wild confusion and discord. Marius, an admirable soldier, but otherwise a man of mediocre talents, and utterly unfit to play the part of a statesman, was the idol of the poor citizens, who urged him to save the state from the rapacious misgovernment of the rich. His attempts were pitiable failures; the brave honest soldier fell into the hands of unscrupulous demagogues like Glaucia and Saturninus, and sullied the laurels he had won in war by associating with men who did not hesitate to assassinate a political opponent. Not less fruitless was the wise and patriotic effort of Livius Drusus—the Gracchus of the aristocracy—to effect a compromise between the privileges of the rich and the claims of the poor. The oligarchic party among the former, i. e. the senate, were enraged by his proposition to double their numbers by the introduction of 300 equites; the latter by his offer to the 'Latins' and 'Allied Italians' of the Roman franchise. Drusus fell 91 B.C., by the steel of a hired bravo. Hardly a year elapsed before the whole of the subject 'Italians'—i. e., the Marsians, Pelignians, Marrucinians, Vestinians, Picentines, Samnites, Apulians

and Lucanians—were up in wild and furious revolt against R.; and, though the rebellion was crushed in less than two years by the superior generalship of Marius, Sulla, and Pompeius Strabo (father of the 'great' Pompey), the insurgents virtually triumphed; for the promise which Drusus had held out to them of the 'Roman franchise,' was made good by the *Lex Plautia Papiria* 89 B.C. Yet the cost was terrible. It is calculated that 300,000 men—the flower of R. and Italy, perished in the struggle; nor was even this tremendous holocaust sufficient to appease the Fates. The jealousy that had long existed on the part of Marius towards his younger and more gifted rival, Sulla (q. v.); kindled into a flame of hate when the latter was elected consul 88 B.C., and received the command of the Mithridatic War—an honor which Marius coveted for himself. Then followed the fearful years of the 'civil wars' between the two chiefs, 88–82 B.C., when blood was spilt like water; and proscriptions and massacres were the order of the day. It was a 'Reign of Terror'—surpassing even the excesses of the French Revolutionists.

Sulla, the leader of the aristocracy, which was nominally the party of order, triumphed, but the ferocious energy displayed by the revolutionists convinced him that the 'Roman franchise' could never again be safely withdrawn from the 'Italians,' and Roman citizens, therefore, they remained till the dissolution of the empire; but, on the other hand, his whole legislation was directed towards the destruction of the political power of the burgesses, and to the restoration to the senatorial aristocracy and priesthood of the authority and influence they had possessed in the times of the Punic Wars. That his design was to build up a strong and vigorous executive cannot admit of doubt, but the rottenness of Roman society was beyond the reach of cure by any human policy. It would be hopeless in our limits to attempt even the most superficial sketch of the complicated history of this period, which, besides, will be found given with considerable fullness of detail in the biographies of its leading personages, SERTORIUS, LUCULLUS, CRASSUS, POMPEY, MITHRIDATES, CÆSAR, CICERO, CATILINE, MARK ANTONY, LEPIDUS, CLEOPATRA, CLODIUS, BRUTUS, CASSIUS, CATO, and AUGUSTUS. The very utmost we can attempt is to enumerate results.

Abroad the Roman army continued as before to prove irresistible. About 13 years after the extermination of the northern barbarians, the Cimbri and Teutones, or in 88 B.C., broke out in the far east the first of the 'Mithridatic Wars,' which, like the Samnite, Punic, and Macedonian Wars, were three in number. Begun by Sulla, 88 B.C., they were brought to a successful close by Pompey, 65 B.C., although the general that had really broken the power of Mithridates was Lucullus. The result was the annexation of the sultanate of Pontus, as a new province of the Roman republic. Next year, Pompey marched southward with his army, deposed Antiochus Asiaticus, king of Syria, and transformed his kingdom also into a Roman province, while in the following year (63 B.C.) he reduced to a state of dependence Phœnicia, Cœle-Syria, and Palestine, storming Jerusalem, and, to the horror of the Jews, violating their Holy of Holies. But what a terrible commentary it is upon these glittering triumphs to remember that during the same year there was hatched at R. the Conspiracy of Catiline (q. v.), which, if it had not been crushed by an extraordinary display of decision on the part of the consul Cicero, would have placed at least the city of R. at the mercy of a crew of aristocratic desperadoes and cutthroats.

One thing now becomes particularly noticeable, viz., the paralysis of the senate—that 'governing board' as Mommsen calls it, that had once been the mightiest power in the world. In spite of all that Sulla did to make it once more the governing body in the state, the power passed out of its hands. Torn by wretched jealousies, spites, piques (personal and partisan), it could do nothing but squabble or feebly attempt to frustrate the purpose of men whom it considered formidable. Henceforth the interest as well as the importance of Roman history attaches to individuals, and the senate sinks deeper and deeper into insignificance, until at last it becomes merely the obsequious council of the emperors. The famous coalition of Crassus, Pompey, and Cæsar (known as the *First Triumvirate*), which dates from the year 60 B.C., proves how weak the government and how powerful individuals had become; and the same fact is even more dismally brought out by the lawless and bloody tribunates of Clodius and Milo (58–57 B.C.), when R. was for a while at the mercy of bravos and gladiators. The campaigns of Cæsar in Gaul (58–50 B.C.), by which the whole of that country was reduced to subjection; his rupture with Pompey; his defiance of the senate; the civil wars; his victory, dictatorship, and assassination; the restoration of the senatorial oligarchy; the second triumvirate, composed of Antony, Lepidus, and Octavian; the overthrow of the oligarchy at Philippi; the struggle between Antony and Octavian; the triumph of the latter, and his investment with absolute power for life (29 B.C.), which put an end at least to the civil dissensions that had raged so long (and was therefore so far a blessing to the state), are described in the biographical articles already referred to.

THE ROMAN EMPIRE.—When Augustus had gathered up into himself all the civil and military powers of the state, its political life was at an end; henceforth the voices of the citizens are dumb, and only the rude clamor of the legions or the Prætorians (q. v.) is heard, as emperors rise and fall. It is, indeed, amazing to consider how long brute force managed to keep under the elements of anarchy and dissolution in the empire; but it must be remembered that it was the East that ruined R., and not R. the East. Even in the worst days of the republic, the Roman administrators of the provinces were acknowledged to be less unjust, ravenous, tyrannical, and cruel than the native princes and sultans; and the servile myriads of Asia Minor and Syria witnessed the deposition of their dynasts without a shadow of regret—sometimes even with a cry of joy. The Romans had therefore comparatively little difficulty in retaining and even increasing their eastern conquests, while the superior discipline of their well-trained soldiery enabled them to repel and subdue even the intrepid barbarians of the North, though singly these were probably more gallant men than the rank and file of the imperial legions. But no military prowess, however great, will, beyond a certain time, serve to keep a nation alive that is otherwise moribund; and even Christianity, with all its antiseptic and revivifying influences, came too late to reanimate the national life of the empire. When Augustus died (14 A.D.), the Roman empire was separated in the north from Germany by the Rhine, but it also included both Holland and Friesland; from about the Lake of Constance it ran along the Danube to Lower Mœsia, though the imperial authority was far from being firmly established there. In the east, the boundary-line was, in general, the Euphrates; in the south, Egypt, Libya, and, in fact, the whole of Northern Africa, as far west as Morocco, and as far inland as Fezzan and the Sahara, acknowledged Roman authority.

The Roman franchise was extended to transmarine communities, and in the western provinces especially it became quite common. To keep this enormous territory, containing so many different races, quiet, an army of 47 legions and as many cohorts was maintained, most of whom were levied among the newly-admitted burgesses of the western provinces. The reigns of Tiberius (q. v.), Caligula (q. v.), Claudius (q. v.), Nero (q. v.), Galba (q. v.), Otho (q. v.), and Vitellius (q. v.), present little of any moment in a general survey of the external history of the empire, though the chronicle of their lives—those of Galba and Otho, perhaps, excepted—has all the horrible and revolting interest that attaches to records of conspiracy, assassinations, poisonings, massacres, lust, debauchery, and delirious madness. The most notable incident of this period is probably the concentration of the Prætorian Guards in the vicinity of R. during the reign of Tiberius, which Niebuhr even pronounces ‘the most momentous event in the history of the emperors;’ and not without reason, for, until their dissolution by Diocletian, they were the real sovereigns of the empire. In Nero’s time, Armenia was wrested from the Parthians, and only restored to them on condition of their holding it as a ‘fief’ of the empire; the Roman authority in England was likewise extended as far north as the Trent; and a great rebellion in Gaul (not, however, against R., but only against Nero), headed by Julius Vindex, a noble Aquitanian and a Roman senator, was crushed by T. Virginius Rufus, the commander of the Germanic legions. During the profound peace that the empire had enjoyed everywhere, except on its frontiers—since the usurpation of the imperial authority—its material prosperity had greatly increased. The population was more than doubled; the towns became filled with inhabitants, and the wastes were peopled, wherever, at least, the Publicani (q. v.) or farmers-general had not got the land into their rapacious hands; but the immorality of the rich, especially among the females, became yet worse than before, and virtuous men actually preferred concubinage with a slave, to marriage with a free-born Roman lady.

With the accession of Vespasian (q. v.) a better era commenced, which, if we except the reign of Domitian, continued uninterrupted for a space of 100 years, comprising the reigns, besides those mentioned, of Titus (q. v.), Nerva (q. v.), Trajan (q. v.), Hadrian (q. v.), Antoninus Pius (q. v.), and Marcus Aurelius (q. v.). These were all men of fine and honorable character—some, as e. g., Trajan, Hadrian, and Marcus Aurelius, were really illustrious rulers, worthy of the best days of Rome. Under all of them the provinces were better governed, the finances better administered, and public morals wonderfully improved. Nothing, indeed, is more clear than that, after the time of Vespasian, that *restaurator rei publicæ*, as he has been justly called, the worst days of Rome (in a moral point of view) were over. Never again did she give way to the horrible sensuality, gluttony, and profligacy of the 1st century. Bad emperors she had as well as good, but they did not again succeed in corrupting their age. Blood, indeed, was shed freely enough, hostilities on the frontiers were as frequent as ever, and the violence and selfishness of military ambition were things that paganism did not seek, and had not the power, to quell; but the wild abyss of anarchy into which the empire latterly fell is less dreadful than the saturnalia of vice

that filled the soul of Juvenal with indignation in the days of Domitian. How far the change was due to the influence of the ever-extending Christian religion, it is impossible to tell; but that Christianity did send a reinvigorating breath of new life through the old decaying body of the state is beyond all dispute, and is written on the very face of the history of the first centuries. The chief military events, from the days of Vespasian to those of Marcus Aurelius, are the final conquest of Britain by Agricola (q. v.), the final conquest of the Dacian monarchy, the victorious invasion of Parthia and of Northern Arabia; and the conquest of the valley of the Nile as far south as Upper Nubia, by Trajan; the chastisement of the Marcomanni, Quadi, Chatti, &c., by Marcus Aurelius.

Hadrian’s long rule of 21 years was peaceful, but is memorable as the most splendid era of Roman architecture. The reigns of Commodus (q. v.), Pertinax (q. v.), and Didius Julianus (q. v.) were insignificant, except in so far as they show us the wretched confusion into which the administration of affairs inevitably fell when bad, or hated, or feeble rulers were invested with the purple. Able generals, respectable jurists, honorable senators are not wanting, but their influence is personal and local. The reign of Septimius Severus (193–211 A.D.) is memorable as marking the first real change in the attitude of the emperors towards Christianity. The new religion was beginning to make itself felt in the state; and Severus, who was a Carthaginian, while his wife was a Syrian, may have felt a special interest in a faith that like themselves was of Semitic origin. At all events it was taken under the imperial protection, and began to make rapid way. Caracalla (q. v.) and Elagabalus (q. v.) are perhaps the worst of all the emperors in point of criminality; but the mad brutality of the one and the monstrous debauchery of the other were purely personal affairs, and were regarded with horror by the citizens of the empire. The reign of Alexander Severus is marked by the downfall of the Parthian dynasty of Persian kings, and the rise of the native Sassanidæ (q. v.), which, as Niebuhr observes, ‘was one of the unluckiest things that could have happened to the Roman empire,’ for the latter proved far more formidable enemies than the Parthian rulers. After the assassination of Severus (235 A.D.) followed a period of confusion, bloodshed, and general mismanagement. The names of Maximin (q. v.), Maximus (q. v.), Balbinus (q. v.), Gordianus (q. v.), and Philip (q. v.), recall nothing but wretched quarrels, often ending in assassination. Then followed ‘the beginning of the end.’ The whole of Europe beyond the Roman frontier—the mysterious North—began to ferment. The Franks showed themselves on the Lower Rhine, the Swabians on the Maine; while the Goths burst through Dacia, routed the forces of Decius (q. v.), and slew the emperor himself at Mount Hæmus, crossed the Euxine, and ravaged the whole northern coast of Asia Minor.

A little later—during the reigns of Valerian (q. v.), Gallienus, and the so-called *Thirty Tyrants*—the empire is nothing but a wild distracted chaos, Franks, Alemanni, Goths, and Persians rushing in from their respective quarters, like vultures scenting prey. The Goths swept over the whole of Achaia, pillaging and burning the most famous cities—Athens, Corinth, Argos, &c.; while the Asiatic hordes of Sapor committed even greater havoc in Syria and Asia Minor; and but for the courage and skill of Odenathus, husband of Zenobia (q. v.), who had built up a strong independent kingdom in the Syrian desert, with Palmyra for its capital, might have permanently possessed themselves of the regions which they merely devastated. With Claudius Gothicus (268–270 A.D.), the fortunes of the empire once more begin to brighten. By him, and his successors Aurelian (q. v.), Probus (q. v.), and Carus, the barbarians of the north and north-west, as well as the Persians in the east, were severely chastised. Nay, when Diocletian obtained the purple (284 A.D.) it seemed as if the worst were over, and the empire might still be rescued from destruction; but his division of the empire into East and West, with separate *Augusti* and assistant *Cæsars*—though it sprang from a clear perception of the impossibility of one man administering successfully the affairs of so vast a state—led to those labyrinthine confusions and civil wars, in which figure the names of Maximian (q. v.), Constantius (see **CONSTANTINE**), Galerius (q. v.), Maxentius (q. v.), Maximin (q. v.), Licinius (q. v.), and Constantine; and which were only brought to a close by the surpassing genius of the last-mentioned.

Under Constantine (324–337 A.D.) as all the world knows, occurred the greatest revolution in Roman history since the birth of Christ—viz., the establishment of Christianity as the religion of the state. He also transferred the seat of government from R. to Byzantium, on the Bosphorus, where he founded a new city and named it after himself. But no sooner was the great statesman dead than the mutinous discords that he had kept under by the vigor of his rule, broke loose; the empire underwent a triple division among his sons; and though Constantius, the youngest, ere long became sole ruler, he failed to display the genius of his father, and in his repeated campaigns against the Persians reaped

nothing but disaster and disgrace. But the political fortunes of the empire now possess only a secondary interest; it is the struggles of the Christian sects and the rise of the Catholic Church that mainly attract the attention of the historian. There, at least, we behold the signs of new life—a zeal, enthusiasm, and inward strength of soul that no barbarism could destroy. Christianity came too late to save the ancient civilization, but it enabled the Roman world to endure three centuries of utter barbarism, and afterwards to recover a portion of the inheritance of culture that it once seemed to have lost for ever. Julian's attempt to revive paganism was a lamentable anachronism, but his efforts, when governor of Gaul under his kinsman Constantius, to repel the incessant incursions of the Franks and Alemanni, displayed a fine valor and generalship, and were crowned with success. The judgment of the poet Prudentius on the apostate is that of posterity: *Perfidus ille Des sed non et perfidus orbi*. But after the death of Julian, the signs of the approaching dissolution of the empire became more unmistakable. Yet the great state was, if we may so speak, loath to die; and again and again in her death-agony, she put forth a momentary strength that amazed her foes, and taught them that even the expiring struggles of a giant were to be feared. Valentinian (q. v.) Gratian (q. v.), and Theodosius (q. v.) were rulers worthy of better times. The last-mentioned is even known to history as the 'Great.' But they fought against destiny, and their labor was in vain. Already swarms of ferocious Huns (q. v.) from the east had driven the Goths out of Dacia, where they had long been settled, and forced them to cross the Danube into the Roman territory, where the cruelty and oppression of the imperial officers, goaded the refugees into insurrection; and in their fury, they devastated the whole east from the Adriatic to the Euxine.

Theodosius indeed subdued and even disarmed them; but he could not prevent them from drawing nearer to the heart of the empire, and already they are found scattered over all Mœsia, Servia, and Northern Illyricum. Hardly was Theodosius dead when they rose again, under their chief, Alaric (q. v.), against Honorius, emperor of the West. R. was saved (for the moment) only by the splendid bravery and skill of Stilicho (q. v.), the imperial general; but after his assassination, the barbarians returned, sacked the city (410 A.D.), and ravaged the peninsula. Three years earlier, hordes of Suevi, Burgundians, Alemanni, Vandals, and Alans burst into Gaul (where the native Celts had long been largely Romanized in language and habits), overran the whole, and then penetrated into Spain, where a Vandal empire was rapidly set up. It is utterly impossible (within our limits) to explain the chaotic imbroglia that followed in the West—the struggles between Visigoths and Vandals in Spain, between Romans and both, between usurpers of the purple and loyal generals in Gaul—the fatal rivalries of those otherwise noble and gifted men—Boniface, governor (*comes*) of Africa, and Ætius, governor of Gaul—which led to the invasion of Africa by Genseric (q. v.), and its devastation from the Straits of Gibraltar to Carthage (429 A.D.). While such was the state of affairs in the West, things were not a whit better in the East. There the Huns, from mere love of havoc, had reduced vast regions to an utter desert; for nearly 50 years, indeed, the little ferocious demons had rioted in destruction. At last, a trivial quarrel sent them into Gaul; but somewhere in Champagne, they were routed with great slaughter (451 A.D.) by a combined force of Visigoths, Burgundians, Franks, and Roman mercenaries, under Ætius and Theodoric, king of the Goths; and in spite of their successful invasion of Italy in the following year, their strength was permanently broken, and henceforth they play an insignificant part in history.

But Ætius, the only man who could have decently propped up the wretched ruin, called the Western Empire, was assassinated by his contemptible sovereign Valentinian, whose own outrages led to his murder too; while his widow, Eudoxia, to be revenged on his murderer and successor, Petronius Maximus, invited Genseric, the 'scourge of God,' over from Africa, and exposed R. to the horrors of pillage for 14 days. Ricimer, a Sueve, next figures as a sort of governor of the city, and what relics of empire it still possessed, for Gaul, Britain, Spain, Western Africa, and the islands in the Mediterranean, had all been wrested from it. While Majorian—the last able emperor—lived, Ricimer's position was a subordinate one, but, thenceforth, the western emperor merely was an emperor in name—a *roi fainéant*—while the real sovereignty was exercised by this Suevic *Maire du Palais*, who was succeeded in his functions by the Burgundian King Eudobald, and the latter again by Orestes, in whose time the final catastrophe happened, when Odoacer (q. v.), placing himself at the head of the barbarian mercenaries of the empire, overthrew the last, and the most ridiculous, occupant of the throne of the Cæsars (476 A.D.), who, by a curious coincidence, bore the same name as the mythical founder of the city—Romulus. See, besides the ancient histories of Polybius, Livy, Silius, Tacitus, &c., the modern histories of Gibbon, Niebuhr, Arnold, Merivale, Duruy, Mommsen, and Ihne.

ROME, the capital of ancient Italy, stood on the left bank of the Tiber, about 16 miles from the sea. The legend of its origin belongs to Roman history, and is discussed partly under that heading, and partly in the article ROMULUS. It was built at first in the form of a square (*Roma Quadrata*), and gradually extended, until, in the reign of Servius Tullius, it embraced one after another the famous seven hills—viz., the Palatine, Capitoline, Quirinal, Cælian, Aventine, Viminal, and Esquiline. Servius Tullius (according to the legend) so extended the *pomerium* as to make the sacred enclosure of the city identical with its walls. After its first destruction in 390 B.C. by the Gauls, it was lastly rebuilt without respect to order, and with narrow irregular streets. At the close of the wars against Carthage, Macedonia, and Syria, public buildings and private houses of great architectural beauty were added; and under Augustus, improvements of a similar kind were made, while the mean and narrow streets were allowed to stand. In the reign of Nero, 64 A.D., two-thirds of the city were destroyed by fire, a catastrophe which furnished that emperor with the opportunity of gratifying his architectural predilections, in widening and straightening the streets, and in restricting the height of the houses, of which a certain part was built of fire-proof stone from Gabii and Alba. Although it had long outgrown the limits prescribed by Servius Tullius, still the walls of that king marked the extent of R. properly so called down to the 3d c. A.D. Under Aurelian, however, the need of fortifications led to the construction of new walls, which took in the city of Servius Tullius with all the suburbs, such as the Mons Janiculus on the right of the Tiber, and the Pincian on the left. These walls, begun 271 A.D., were completed by the next emperor, Probus, were eleven miles in circumference, and were afterwards restored by Honorius, and partially rebuilt by Belisarius.

Extent and Population of Rome.—Under Servius Tullius, the walls were seven miles in circumference, but the space which they comprised was not entirely occupied by buildings. Under Aurelian, the new walls were 11 miles in circumference, and the city went on extending until it reached a circumference of 13 miles under Vespasian. The population at any given period cannot be exactly determined. According to the *Monumentum Ancyranum*, the *plebs urbana* under Augustus amounted to 320,000; with the addition of women, senators, and knights, the inhabitants must have numbered about 650,000; while the slaves, who cannot have been less numerous than the free population, must have given an aggregate of at least 1,900,000. Considering the enlargement of the city under Vespasian, we may safely set its population down at not less than two millions in his reign.

The Walls and Gates.—The first wall, that attributed to Romulus, embraced merely the Palatine, and was pierced by three gates. The larger wall of Servius Tullius does not appear to have been continuous, but only to have connected the seven hills by fortifications drawn across the narrow valleys intervening. According to Pliny, there were 37 gates in this wall. Subsequent to the walls of Servius were those of Aurelian, which, with the exception of the part beyond the Tiber, are the same as those which surround the modern city. They were divided by 14 gates. The Tiber was crossed by eight bridges.

In the interior of the city were several open spaces of ground, paved with stones, which were used as places of business or as market-places, and were called *fora* (see FORUM). Besides these, there were other open spaces of much larger extent, which were grass-grown, and set with trees and works of art. Of these, which were called *campi*, and were used by the people in their exercises and amusements, the chief was the Campus Martius.

Surrounding these fora and campi were the private and public buildings of R., which were arranged in streets and districts. The chief street was the celebrated Via Sacra, remains of which are still to be seen in the Forum of modern Rome.—R. contained no fewer than 400 temples, the oldest being the temple of the Fœderian Jupiter, on the Capitoline, which was built, according to tradition, by Romulus, and restored by Augustus. The most famous in history, and the most magnificent in architecture, was the Capitolium, placed on the summit of the Capitoline (see CAPITOL). The only other temple requiring special mention was the Pantheon (q. v.), built by Agrippa, 27 B.C. It is still standing.—For other striking features of the ancient city, see CIRCUS, AMPHITHEATER, BATH, BASILICA.

R. also abounded in covered walks, supported by columns, and open on one side. These were known as *porticus*, and were frequented for the purposes of recreation, or of transaction of business. They were in many cases adorned with paintings and other works of art, and furnished with libraries.—More peculiar to ancient Rome, however, were the triumphal arches. See ARCH, TRIUMPHAL.—The great prison of R. was the Carcer Mamertinus, built by Ancus Martius on the slope of the Capitoline, which overhangs the Forum. Servius Tullius added to it a subterranean dungeon, 12 feet underground, walled and arched over with masonry.—In addition to the prisons, we may mention the barracks (*castra*), such as the Castra Prætorial, built by

the Emperor Tiberius for the imperial guards; and the *Castra Peregrina*, where the foreign troops were quartered; the aqueducts (see *AQUEDUCT*); and the sewers (see *CLOACA MAXIMA*).

R. also abounded in palaces (*palatia*). Of these, the Palatium, or imperial palace, fronting the Forum, was so enlarged by Augustus, that from being the private house of Hortensius the orator, it became the imperial residence. Nero built two still more splendid palaces, one which covered the whole Palatine Hill and part of the Esquiline, and was burned down in the great fire; and one which replaced the other. Many of the private palaces were also on a magnificent scale.—On the hills around the city were laid out *horti*, or parks and gardens, and were adorned with handsome buildings and works of art.—R. was also rich in sepulchral monuments. See *ROMAN ARCHITECTURE*.—In addition to these imperial or private mausolea, columns were also erected to the more illustrious of the Romans, such as the Columna *Rostrata*, in honor of the consul C. Duilius for his victory over the Carthaginian fleet; the Columna *Trajana*, in the Forum; and the Columna *Antonini Pii*, in the Campus *Martius*.—Obelisks (q. v.), mostly transported from Egypt, occupied prominent parts of the city. Since R. has again become the capital of Italy, extensive excavations among the ruins have been carried on upon a systematic plan, and with interesting results.

Modern Rome occupies the plain on each side of the Tiber and the slopes of the seven hills. Its geographical position at the Observatory of the Collegio Romano is lat. $41^{\circ} 53' 52''$ N., long. $12^{\circ} 28' 40''$ E. and its height above the level of the sea, on the Tiber, under the *Ælian Bridge*, is 20 feet. Pop. (1871) 229,356; (1881) 272,010 (*Commune* in 1881, 300,467). The members of religious orders, in 1867, were 7400, including 30 cardinals, 85 bishops, 2892 monks, and 2215 nuns. It contained 4650 Jewish residents, still compelled to inhabit a particular quarter, called the Ghetto. 50,000 persons were then in receipt of public alms.

The city is built on marshy ground, and is divided by the Tiber into two very unequal parts, that on the left bank being R. Proper, and that on the right bank being the *Leonine city*, or *Trastevere*. Its walls, 12 miles in circuit, and containing 16 gates, of which 4 are built up, enclose a space of which little more than one-third is inhabited, the greater part to the south of the Capitol being cultivated as gardens or vineyards. The site of the ancient *Campus Martius* constitutes the lower and most densely populated part of the town, in which all the trade is carried on. Its central part is crossed by the *Corso*, a street about one mile long, and running from the *Piazza del Popolo*, or great northern entrance of R., to the *Palazzo di Venezia*, at the foot of the Capitol. From the *Piazza del Popolo*, a handsome open space, with an obelisk from the Temple of the Sun at *Heliopolis* in the middle, branch out to the right and left of the *Corso*, the *Piazza di Spagna*, the favorite quarter of foreigners, and the *Ripetta*. More than halfway up the *Corso*, and to the right, runs the wide street or *Strada del Gesù*, leading to the noble church and convent of that name, the chief residence of the order of the *Jesuits*. On either side of the *Corso*, the buildings are regular and substantial, and consist of palaces, such as the *Borghese*, the *Ruspoli*, the *Giulii*, and others, besides many churches. Between the *Corso* and the Tiber, to the west, the streets are irregular, densely peopled with inferior tradesmen, and consisting mainly of market-places, shops, and dwellings of a low class. In this quarter is the University *La Sapienza*, between which and the *Corso* is the *Rotonda* or *Pantheon*. South of *Ponte Sisto*, on the left bank of the Tiber, and winding round the western base of the Capitol to the foot of the Palatine, is the Ghetto, or *Jews' Quarter*, consisting of narrow dirty alleys, with rows of high old houses.

Still further south, and on the left bank of the Tiber, runs a series of narrow streets as far as the Palatine, containing some of the oldest churches in R., such as the *Santa Maria in Cosmedin*, built in the 3d century. Beyond this extend to the south-east the *Aventine*, *Palatine*, and *Cælian hills*, which are covered with gardens, vineyards, and orchards, besides churches, convents, and ruins. At the eastern extremity of the *Cælian* stands the magnificent *Basilica of San Giovanni in Laterano*. To the south of the *Aventine*, and between it, the river, and the walls, are the *Prati del Popolo Romano*, forming part of a large space of low-lying cultivated ground. Near the *Prati* lies the Protestant Cemetery.

On the slope of the *Pincian* and *Quirinal hills*, and covering part of the plateau which joins all the eastern hills of R., lies the upper town, consisting mainly of palaces, villas, churches, convents, and other buildings on a large scale. It abounds with ample courts, and gardens, and is crossed by two long streets, which intersect each other at right angles on the crest of the *Quirinal*. The *Pincian* is laid out in fine walks, which are the favorite promenade of the Romans; while between the *Pincian* and the *Quirinal* stands the great *Barberini Palace*. On the summit of the *Quirinal* is the famous pontifical palace and garden; and in the square before the palace are the two colossal statues of *Castor* and *Pollux*, with their horses, whence the hill receives its other name of *Monte*

Cavallo. On the *Esquiline*, which here joins the *Quirinal*, and forms the eastern extremity of the city, stands the magnificent church of *St. Maria Maggiore*; beyond it to the north, east, and south, the *Esquiline* is entirely covered with gardens, villas, and fields, with here and there a church. The principal buildings on the Capitol are three palaces, the work of *Michael Angelo*, which form three sides of a square, in the center of which stands the equestrian statue of *M. Aurelius Antoninus*. One of the palaces is the *Capitoline Museum*, one of the finest collections of statuary and sculpture in Italy.

The third great division of the modern city lies on the right bank of the river, and is subdivided into two parts—the *Vatican* (otherwise called *Il Borgo*) and the *Trastevere*. Divided from the latter by an inner wall, the *Borgo* or *Leonine city* occupies the space between the bridge of *St. Angelo* and the *Piazza of St. Peter's*. Its chief buildings are the palace of the *Vatican* (q. v.), and the *Basilica of St. Peter's* (q. v.). Besides the *Vatican* and *St. Peter's*, the *Leonine city* contains the great hospital of the *Santo Spirito*, which accommodates annually 18,500 patients, laboring under all diseases, whether mental or bodily. The *Castle of St. Angelo*, with massive circular tower, called from its founder the '*Mole of Hadrian*,' is surrounded with ramparts, ditches, and bastions, mounted with cannon, and forms the citadel of Rome.

To the south of the *Borgo*, and between the *Janiculum* and the Tiber is the *Trastevere*, properly so called. The *Janiculum*, a straight ridge, about a mile and a half long from north to south, rises about 300 feet above the level of the river. The northern half of its length is occupied by the long street called the *Lungara*, running closely parallel to the Tiber, which, at the southern extremity of the *Lungara*, makes a bend to the east, and bounds the greater part of the *Trastevere* district. On the *Janiculum* is the *Villa Spada*, near the gate, outside of which is the *Villa Pamfili*, a favorite promenade of the Roman youth. On the same hill, the fountain called *L'Acqua Paola*, the largest in Rome, occupies a commanding site, and, as seen from a distance, resembles a triple triumphal arch, through which streams of water rush.

The churches, of which there are upwards of 300, form a notable feature in R., from their architecture, their paintings, and other decorations. So also are the palaces of the aristocracy, which are often of great magnitude, with vast courts and spacious apartments. Of even better style as residences are the villas, both within and without the walls; while the handsome fountains, of which there are at least 12 principal ones, impart a cheerful and refreshing aspect to the city. There are three modern aqueducts, which keep R. supplied with abundance of water: the *Acqua Vergine*, the *Acqua Felice* (the ancient *Acqua Marcia* and *Claudia*), and the *Acqua Paola* (the ancient *Alsetina*).

R. is, on the whole, a healthy city, except at the close of summer and the beginning of autumn, when the malaria is prevalent. The *Trastevere* is its most uniformly healthy district, the inhabitants of which are superior in physical development to those of the other parts. The neighborhoods of the *Pincian* and the *Quirinal*, particularly the former, are most frequented by Englishmen. The trade of the city is insignificant, consisting of a few trivial manufactures of hats, silk scarfs, gloves, artificial feathers, false pearls, mosaic trinkets, &c., and of such articles as artists need and visitors fancy. The only great manufacture, if it can be called so, is that of pictures, original and copied; for the painting of these, R. offers not only the advantage of numerous galleries of art, but purity of sky. The worst feature of R. is its dirtiness. In October, 1870, R., along with the rest of the *Papal territory*, was annexed to the kingdom of Italy, and is now the capital. The Pope retains the rights of a sovereign within the *Vatican*.

ROME, a township and village of New York, U.S., on the *Mohawk River*, *Eric Canal*, *Black River Canal*, and *New York Central Railway*, 100 miles north-west of *Albany*. It contains a U. S. arsenal, court-house, jail, academy, 15 churches, 2 newspapers, and numerous manufactories. Pop. (1870) 11,000; (1880) 12,045.

RO'MFORD, a market-town in the county of *Essex*, stands on the river *Bourne*, or *Rom*, 12 miles from *London*, on the *Great Eastern line*. The annual horse-fair commences on *Midsummer Day*, and lasts three days. There are extensive breweries of the famous '*Romford ale*.' Agricultural implements are largely manufactured. Pop. (1881) 6861.

ROMILLY, SIR SAMUEL, English lawyer and law reformer, born March 1, 1757, was descended from a family of French Protestants, who, after the revocation of the *Edict of Nantes*, emigrated to England. At the age of 16, R. was articled to Mr. Lally, one of the sworn clerks in *Chancery*; and at 21 he entered himself at *Gray's Inn*. At first he made little progress in his profession; but after a time he began to apply himself to the study of criminal law; and in 1789, entertaining, like many other English Liberals, a sanguine expectation of the happy effects of the French Revolution, he published a short pamphlet on the subject.

In 1792, and again in 1795, he declined Lord Lansdowne's offer of a seat for Calne. In 1806, he was, at the instance of Mr. Fox, appointed Solicitor-general in the Grenville administration. He unwillingly received the honor of knighthood; but the king having, for the last twenty years, knighted all his Attorneys and Solicitors-General on their appointment, would take no refusal. He was afterwards returned for Queensborough, was one of the managers of Lord Melville's trial, and passed a bill to amend the bankrupt laws. In 1807, he went out of office, and was elected for Horsham, but being unseated, was returned for Wareham. He now devoted himself to ameliorate the severity of the criminal law, and proposed the abolition of the punishment of death in various cases of theft. He also published a pamphlet *On the Criminal Law as it relates to Capital Punishments*.

His bills were, session after session, opposed by the government of the day, the judges, and many of the bishops, as dangerous innovations; but R. nevertheless persevered, and lost no opportunity of protesting against the severity and frequency of capital punishments. The measures he proposed for mitigating the severity of the criminal law were, for the most part, carried by others; but he framed an act for rendering the punishment of high treason less barbarous, and another for taking away corruption of blood, as a consequence of attainder of felony. He took an active part in the anti-slavery agitation, and in opposing the suspension of the Habeas Corpus Act, the spy system, and the despotic acts of the government. In 1818, he was spontaneously chosen by the electors of Westminster as their representative. The death of his wife, following upon prolonged mental exertion, preyed upon his mind, and three days afterwards (November 2, 1818) he died by his own hand. He had at this time attained the foremost rank at the Chancery bar, and his professional gains were said to average £14,000 a year. His death excited profound sympathy, and was considered a public calamity. His *Speeches in Parliament* have been published in two vols.; and his *Autobiography*, with a selection from his Correspondence, admirably edited by his sons, has also been published in 2 vols.—His second son, **BARON ROMILEY**, educated at Trinity College, and called to the bar at Gray's Inn, 1827, was made Solicitor-general in 1848, Attorney-general in 1850, Master of the Rolls in 1851, and created a Baron in 1866. As Master of the Rolls R. incidentally rendered great services to his country, by superintending the publication of public records tending to throw much light upon English history and events. He died on December 23, 1874.

ROMORANTIN, a small town of France, in the dep. of Loir-et-Cher, 25 miles south-east of Blois. At the siege of this town by the Black Prince in 1356, artillery is said to have been first used. Various woollen fabrics are manufactured. Pop. (1876) 7436.

RO'MPU, in Heraldry, a term applied to a chevron when the upper part is taken off, and remains above it in the field.

RO'MULUS, the mythical founder of the city of Rome. His name is only a lengthened form of Romus, and he is therefore to be regarded rather as a symbolical representation of the Roman people than as an actual individual, like Æolus, Dorus, and Ion, the eponymous ancestors of the Æolians, Dorians, and Ionians. But though the legend of R. cannot be accepted as history in its details or its outlines, it is nevertheless interesting to know how, after the lapse of years, when Rome had become a place of importance, its inhabitants tried to conceive a probable origin for it. We will therefore relate the story of R. as it is usually given. At Alba Longa, in Latium, there had ruled for some centuries a line of kings descended from the Trojan prince, Æneas. One of the latest of these, at his death, left the kingdom to his eldest son, Numitor. Amulius, a younger brother of Numitor, who was ambitious, deprived the latter of the sovereignty, murdered his only son, and compelled his only daughter, Silvia (generally, but incorrectly, called Rhea Silvia), to become a vestal virgin, thereby hoping to secure immunity for his crime. But Silvia having become the mother of twins by the god Mars, his fears were aroused, and he resolved to drown all the three. A cradle containing the babes was thrown into the Anio, whence it was carried into the Tiber. That stream was then in flood, and had overspread its banks far and wide. The cradle was stranded at the foot of the Palatine, and the infants thus wonderfully saved from death by drowning, were no less wonderfully saved from death by hunger. A she-wolf carried them into her den, near at hand, and suckled them, while a woodpecker brought them whatever other food they wanted. This marvelous spectacle was at length beheld by Faustulus, the king's shepherd, who bore the infants home to his wife, Acca Larentia, and had them brought up with his own children.

A strife having one day arisen between them and the herdsmen of Numitor, who stalled their cattle on the Aventine, Remus, one of the twins, was taken prisoner, and carried off to Numitor. When the latter looked on the youth, he could not help thinking of his grandsons; and the story of the miraculous preservation of

the twins, strengthened the suspicions that were beginning to form in his mind. R. now made his appearance, accompanied by his foster-father; an *éclaircissement* took place; Numitor acknowledged the boys as the sons of his daughter Silvia, and they immediately proceeded to avenge the family wrongs, by slaying Amulius, and placing their grandfather on the throne. But, continues the legend, R. and his brother did not care to remain in Alba Longa; they loved their old abode on the banks of the Tiber, and resolved to build a city there. The Palatine was chosen (by augury) for the site, and R., yoking a bullock and a heifer to a ploughshare, marked out the *pomerium*, or boundary, on which he proceeded to build a wall. Remus laughed at the idea of keeping off enemies by such means, and to show its inefficiency, scornfully leaped over it, whereupon R. slew him, but was immediately struck with remorse, and could obtain no rest till he had appeased the shade of his brother by instituting the *Lemuria*, or festival for the souls of the departed. The next thing which R. did was to erect a 'sanctuary' on the Capitoline for runaway slaves and homicides, and by this means he soon increased the number of his followers; but as wives were much wanted, R. tried to obtain them legally from the neighboring states. His efforts, however, failed: a 'runaway slave' not being considered a desirable match for his daughter by a Latin or Sabine paterfamilias, and he was compelled to have recourse to stratagem. This led to the celebrated *Rape of the Sabine Women*, the incidents of which are too familiar to require narration. The consequence of this wholesale abduction of virgins was a series of wars, in which, however, R. was invariably victorious, until Titus Tatius, at the head of a large army of Sabines, drove him from the open fields, and forced him to take refuge in his city on the Palatine.

R. had also garrisoned the Capitoline, but the treachery of Tarpeia, a daughter of the lieutenant of the fort, placed it in the hands of his adversaries. Next day, a battle took place in the valley between the two hills. It was long and fiercely contested. Sabines and Romans fought till they were exhausted, when the Sabine women rushed in between their husbands and fathers, and implored them to be reconciled. This was agreed to, and henceforth they resolved to unite and to form only one people—the followers of R. dwelling on the Palatine, those of Titus Tatius on the Capitoline and Quirinal. On the death of Titus Tatius, who was murdered at a festival held at Lavinium, R. became sole sovereign, and subsequently—according to a later legend—made successful war against the Etruscan cities of Fidenæ and Veii. The political organization of the Roman *populus* ascribed to R. is given under **ROME**. After a reign of 37 years, R. was miraculously removed from earth. While he was standing near the 'Goat's Pool,' in the Campus Martius, reviewing his militia, the sun was eclipsed, and a dark storm swept over the plain and hills. When it had passed, the people looked round for their king, but he was gone. His father, Mars, had carried him up to heaven (like the prophet Elijah) in a chariot of fire. Some time after, he reappeared in a glorified form to Proculus Julius, announced the future glory of the Roman people, and told him that henceforth he would watch over them as their guardian god, under the name of Quirinus. The festival of the Quirinalia (17th February) was instituted in his honor; but the nones of Quintilis (7th July) was the day on which he was believed to have departed from earth.

RO'MULUS AUGU'STULUS. See **ODOACER**.

RO'NALDSHAY, NORTH AND SOUTH, two of the Orkney Islands (q. v.). *North R.*, situated at the north extremity of the Orkneys, has an area of 4 sq. miles. It is partly under tillage, and partly in pasture. Sea-birds in great variety frequent the coasts, and lobsters and cod are fished. Pop. (1881) 547.—*South R.*, washed on the south by the Pentland Firth, has an area of about 18 sq. miles. St. Margaret's Hope, on the north coast, is a safe and convenient harbor. The inhabitants derive their subsistence for the most part from fishing for cod and herrings. Pop. (1881) 2557.

RONCESVALLES, one of the valleys in Navarre, on the southern side of the Pyrenees, about 20 miles north-north-east of Pamplona, has been rendered famous in poem and story as the scene of a defeat sustained by the army of Charlemagne at the hands of a combined force of Arabs, Navarrese, and French Gascons in 778. Charlemagne, allured by the promise of the feudal supremacy of Catalonia, opened a campaign in aid of the viceroy of that province against the Mohammedans. With a powerful army he passed the Pyrenees, penetrated into Navarre, took Pamplona, the capital, and levelled the walls of the city with the ground. Clearly this was not part of his programme as the champion of the Christian religion in Spain; for Pamplona was the capital of a Christian state, and it is even asserted that prior to 870 A.D. Moors had not been admitted within its walls. Pressing onward, Charlemagne subdued a great part of the country between the Pyrenees and the Ebro; but on his return northward, while threading the defiles of the mountains near R.

his rear-guard was furiously assailed and annihilated by a mixed force, of which a body of Navarrese, enraged at the destruction of their capital, formed an important section.

Eginhard, the secretary of the emperor, tells us that the whole rear-guard, including many generals and chief nobles, was totally destroyed, and that the spoil of the campaign, together with the whole baggage of the army, fell into the hands of the victors. In this action fell Roland (q. v.), the famous Paladin, and the hero of a hundred romances. The older poets found abundant material in the battle of R., in which, on the one side, ranked the most distinguished chivalry of that time, and on the other the patriotic, high-spirited, mountaineers of Navarre; and in recent times the incident has contributed a spirited allusion to Sir Walter Scott's *Marmion* :

'Oh, for a blast of that dread horn,
On Fentaraban echoes borne,
That to King Charles did come,
When Roland brave, and Olivier,
And every paladin and peer,
On Roncesvalles died !'

RONCIGLIONE, a city of Central Italy, in the province of Rome, and 12 miles south-south-east of the city of Viterbo. Pop. 6084. It has a fine cathedral, a Gothic castle, and several fine old palaces. Hats, cloth, and cotton goods, are manufactured, and iron, brass, and copper works are in operation. In the neighborhood of the city there are sepulchral vaults, hollowed out in the porous rock (*tufo*), and several sulphureous springs.

RO'NDA, a picturesque Moorish town of Spain, in the modern province of Malaga, on the Guadiaro, 50 miles north-north-east of Gibraltar. Situated at a considerable elevation, the climate of R. is unusually salubrious, and the town is a favorite summer retreat for the wealthy of Seville, Ecija, and Malaga. The great annual fair takes place in May, at which time R., its bulls and bravoes, are seen to the greatest advantage. On such occasions, the small but active horses of the town are sold in large numbers to officers from Gibraltar; and leather, saddlery, embroidered gaiters, garters, and mantas, are also sold. Pop. 23,500.

RONDELET, WILLIAM, a French naturalist, born at Montpellier in 1507; died 1586. He became a medical practitioner in Montpellier, and professor in the medical school there. He was a zealous student of natural history, and particularly distinguished himself in ichthyology. His *Histoire entière des Poissons* (Lyon, 1558) was one of the first works which contributed much to the progress of that branch of science.

RO'NDO (Ital.), or RONDEAU (Fr.), originally a little poem of 13 lines, divided into three unequal strophes; the two or three first words of the first line serve as the burden, and recur after the 8th and 13th line. Thence, in music, the term has come to denote a light air, consisting of three or more strains, the first terminating in the original key, and each of the others so constructed as to conduct the ear back to a repetition of the first strain. In a more general sense, the name rondo is also often applied to any light lively tune which ends with the first strain repeated.

RONGE, JOHANN. See GERMAN CATHOLICS.

RONSARD, PIERRE DE, a celebrated French poet and reformer of French poetry, was born at the Château de la Poissonnière, in Vendôme, September 11, 1524. At the age of nine, he was sent to the Collège de Navarre, but was soon removed, and shortly after entered the service of the Dauphin as page. Handsome, well-made, and excelling in all bodily accomplishments, he soon became a general favorite. When his master died (1536), he became attached to the household of the Duc d'Orléans, second son of the king, accompanied James V. of Scotland back to his kingdom, with his new bride, Marie de Lorraine, in 1538; and after a stay of nearly three years at the Scottish, and six months at the English court, he returned to France, and re-entered the service of the duke. A little later, however, on recovering from a serious illness, he found himself afflicted with a deafness, which led him to resign the pursuits of arms for those of letters. With this view, he took up his residence in the Collège de Coqueret, and studied hard for five years. He had previously acquired a knowledge of Latin and of several European languages. His own language, as a vehicle of literary instruction, was a subject of continual meditation with him.

Familiar now with the masterpieces of Greece and Rome, he wished (like a true child of the Renaissance, as he was) to invest the national poetry with a classic dignity and grace. Several of his fellow-students shared his opinions and enthusiasm; and in 1549, one of these, Joachim du Bellay, published what may be called the first manifesto of the new school, the *Illustration de la Langue Française*. Without denying the necessity or the value of the change thus begun by R. and his friends, we may just remark in passing that the most intelligent French critics now admit that it was too radical, too absolute; it broke abruptly with the national traditions and tendencies, and more than anything else

helped to fix that pseudo-classicism of style which was subsequently brought to disastrous perfection in the *splendida vitia* of Corneille and Racine. In 1550, R. himself appeared in the field with his *Amours* and *Quatre Livres d'Odes*. The volume excited the most violent opposition among the adherents of the older national school, and it cannot be said that their antipathy was altogether unreasonable. Rabelais (q. v.) was conspicuous among the adversaries of the new school, and made R. the subject of some bitter sarcasms. But on the whole, the classic party had the best of it. Its efforts were in harmony with the general intellectual tendencies of the time, and besides, R. was just the man to make powerful friends. Marguerite, sister of Henry II., granted him a pension; the illustrious Chancellor De l'Hôpital warmly encouraged him to persevere in his course; and both Henry II. and François II. covered him with honors and pensions. In 1553, a new edition of the *Amours* was published; in 1555, the first, in 1556, the second, volume of his *Hymnes*; and finally, in 1560, an edition of his whole works up to this period, in four volumes. The admiration of his contemporaries intoxicated him; and he did not shrink from conferring on himself a sort of anticipatory apotheosis.

During the religious wars that devastated France, R. made himself noted by the violence of his attacks on the Calvinists or Huguenots. Twenty days after the massacre of St. Bartholomew, he published *La Franciade*, an epic fragment. He meant that it should comprise 24 books, but he only finished 4, having, perhaps, discovered that the subject was not happily chosen, and that epic poetry was a touch above him; yet such was the belief in his genius, that not a few of his contemporaries did not hesitate to prefer it to the *Æneid*. Charles IX. could only express his delight by conferring on the lucky bard additional favors. He gave R. the abbey of Croix-Val and Bellozane, and the priories of Saint-Cosme, of Evailles, &c. But the 'disorders' of what his countrymen call his 'joyous' youth, now began to tell upon him, and, afflicted with premature infirmities, he retired to the abbey of Croix-Val, where he spent most of his remaining years in lettered ease, honored with the attentions of the great to the last. Queen Elizabeth of England sent him a set of diamonds, and Mary Stewart, from her prison, a set of plate worth 2000 crowns, with the inscription :

'A' Ronsard, l'Apollon de la Source des Muses.

In 1584, he collected and republished his whole works in one volume, and died on December 27 of the year following.—See Saint-Beuve's *Œuvres Choieses de P. Ronsard, avec Notice, Notes et Commentaires* (Paris, 1828).

ROOD, a measure of surface, the fourth part of an acre, and containing 40 square poles or perches. It is quite different from the rood used in estimating mason-work, for which see ROD.

ROOD (Anglo-Sax. *rod*, a cross), a figure of the cross, and generally of the crucifix. The word is also applied to the actual cross on which our Lord suffered, although, when used to signify the relics of the true cross, it is commonly found with the prefix Holy, from which Holyrood at Edinburgh derives its name; but in its most ordinary signification it is applied to the large and striking crucifix which was placed at the entrance of the chancel in most mediæval churches. On either side of the cross most commonly were placed figures of the Blessed Virgin and St. John, in allusion to John xix. 26. The manner of placing the rood differed in different churches; most commonly it stood upon a gallery or screen at the entrance of the chancel, which was called the ROOD-LOFT or Rood-screen. In England, after the Reformation, the rood of course was, as a rule, removed from all churches; but in a few country churches it still remains in a more or less perfect form. A very perfect foreign example of the rood is in the great church of Louvain.

ROOF. The coverings of houses vary in every climate and every age. In warm countries, such as India, flat roofs, covered with cement, are almost invariably used. The frequent allusions in the Bible to the house-top show that the roofs of Palestine were flat in ancient times as they are now. Those of Egypt and Assyria (q. v.) were also flat, and were composed of wooden beams, covered with thick layers of earth, forming an impenetrable protection from the fierce heat of the sun. In countries where the climate is milder, and rain more abundant, roofs sloping from a central ridge are the usual form. The Greeks and Romans constructed their roofs in this way. Those of Greece were, in important works, covered with marble slabs, carefully grooved together, so as most effectually to protect the interior from rain. In the common buildings of Greece and Rome, roofing-tiles are used.

In the rainy climate north of the Alps, roofs of a much steeper pitch are employed, so as the more readily to throw off rain and snow. The angle at the ridge is not uncommonly a right angle; and roofs slated in the usual way should never be less than $\frac{1}{2}$ of

the span (or width between supports) in height. When large slates are used, $\frac{1}{4}$ of the span in height will suffice.

When roofs are well constructed, they serve to bind the walls together, and thus to strengthen the building. In order to do this effectually, they must not be made of too great weight, otherwise they crush the walls. The actual covering of the roof and its supports are therefore made as light as possible, and the strength concentrated in principals or trusses. The following are the commonest forms of these trusses: Fig. 1. represents what is

Fig. 1.

called a king-post roof (A being the king-post), and fig. 2 a queen-post roof (B, B being the queen-posts). The latter is used for

Fig. 2.

wider spans than the former, and has the advantage of leaving the center of the roof clear of timbers, so that attic rooms may be introduced. The other members of the truss are named as follows: C, C, C, C, braces or struts; D, D, tie-beams; E, E, E, E,

Fig. 3.

Fig. 4.

principal rafters; F, F, ridge-pieces; G, G, &c., purlins; these and the ridge-piece are laid across from truss to truss, and carry the common rafters, J, J. H is a collar. K, K the pole-plates, and L, L the wall-plates, are laid along at the wall-head, to bind the wall and feet of rafters together.

Fig. 5.

The above system of construction has been used from a very early time to the present day. The early Christian, and probably the Roman basilicans, had exactly such roofs. In early Gothic times, roofs of this kind were made ornamental by carving the king-

post, and moulding the tie-beam. During the Decorated style, an arch, or a series of cants (A, A) was introduced, as shown in figs. 3, 4, and 5. As the style progressed, curved braces were placed under the tie-beam, to support it; these were carved and rested on elegant corbels, the spandrels between the braces and

Fig. 6.

the wall being filled with tracery. In the Perpendicular style the central part of the tie-beam is cut away, and the beautiful Hammer-beam (q. v.) roofs of the period become usual (see fig. 6.). The roof of Westminster Hall is one of the finest examples of this kind of roof. These open timber-roofs are used both in churches and halls, but chiefly in the latter, as the church roofs were frequently vaulted. See VAULT. In modern times, when great spans have to be roofed over, combinations similar to those used in Lattice Bridges (q. v.) are required. Recently, iron has been introduced, and by means of it, spaces of almost any width can be roofed over.

ROOK (*Corvus frugilegus*), a species of Crow (q. v.), very common in the southern parts of Britain, and found in many parts of Europe and Asia, even to Japan; about the same size with the common or carrion crow, but easily distinguished from it, even at a distance, by its color, which is a glossy, deep-blue black, in certain aspects grayish. On a nearer view, a more notable distinction is found in the naked warty skin at the base of the bill, extending back rather beyond the eyes, and pretty far down on the throat. Still more different are the habits of the birds, the common crow frequenting lonely situations, and preying much on carrion; the R. choosing rather the neighborhood of human habitations, and seeking its food, both animal and vegetable, chiefly in cultivated fields. Moreover, whilst the common crow is solitary, the R. is gregarious; and very large companies often assemble in rookeries, making their nests in close proximity, generally in tall trees, the same tree often sustaining many nests. So far are they from disliking the companionship of man, that it is not uncommon for rooks to build their nests in the trees which grow in the midst of great cities. A tree even in Cheapside has been occupied by rooks' nests. Few cities or large towns in Britain are without rookeries, sometimes of considerable magnitude. The smoke seems to be disregarded by the birds. The R. is nowhere more abundant than in England and the south of Scotland, but it becomes rare in the northern parts of Scotland, and is not to be seen in Orkney and Shetland; probably, however, not on account of climate, but from want of trees. Sometimes, indeed, rooks have been known to make their nests in steeples, vanes, &c., but rarely. They have been observed to avoid with peculiar caution trees which are decaying and likely soon to be blown over—perhaps, however, on account of the state of their twigs—and trees that are marked on the trunk for cutting down. They are notable for the care with which they guard against the approach of danger, when they are feeding in fields, a few solitary rooks perched on trees, palings, or the like, being ready to give the *caw* of alarm to the often very numerous flock. They are also notable for their dread of a gun, the danger of which they seem to know; so that a man without a gun may approach them much more nearly than a man who carries a gun, and even a stick lifted up is apt to excite their alarm.

It is also commonly believed in some districts that they know Sunday, and are less timid of the approach of man on that day than on other days of the week. A gig or carriage may approach them much more nearly than a man on foot, and they are very indifferent about the passage of a railway train. It is interesting also to observe how soon they become familiarly acquainted with

scarecrows. The nests of rooks are formed of twigs, lined with grass and fibrous roots; generally containing four or five eggs, of a pale greenish color, blotched with dark greenish-brown. During the nest-making time, rooks rob each other in a remarkable manner, and prodigious quarrels arise in rookeries on this account. Any pair attempting to found a separate colony on a tree far apart, are apt to be assailed by the whole force of the rookery, and the nest pulled to pieces, its materials of course being carried off.

Rookeries are sometimes of great size, and immense flocks of rooks are often to be seen feeding together in fields, or darkening the sky in their outward or homeward flight. Farmers very often complain of them for rooting up grass and young corn, and for injury to young potatoes, turnips, &c.; but on the other hand, it is urged that they are of very great use by eating up wire-worms, cock-chaffer grubs, and other insect larvæ, slugs, &c., and that the grass pulled by them is very often that of which larvæ have already devoured the roots. The truth appears to be that rooks in moderate numbers are very useful; but that it is possible to protect them too much, until their multitudes become a nuisance in a neighborhood, the insufficient quantity of their favorite food compelling them to other resources not so agreeable to the farmer; and at least in such circumstances they certainly devour large quantities of grain.

It has been supposed that the naked space at the base of the bill of the R. is in consequence of its habit of digging in the ground, and in support of this view it is urged that this space is feathered in the young bird; but it is found to become naked even in rooks caged from the beginning of their life, and there are numerous other arguments against the supposition. The naked space must be regarded as a natural peculiarity of the species.

The same rooks seem to take possession of their old nests year after year, repairing them, and not building new ones. The time of building and repairing nests is one of prodigious clamor in the rookery, and begins early in spring. The male R. feeds the female assiduously during incubation, and sometimes takes her place on the nest. Both parents bring food to their young ones.

The R. is capable of being tamed, and tame rooks have been known to exhibit something of the imitative power of voice possessed by several other birds of the same family.

White, cream-colored, and pied rooks are now and then seen. These peculiarities of plumage probably arise from a more or less diseased condition.

ROOKERIES, in Law. Though rooks are often encouraged to breed in and to frequent the trees of an estate, yet they are not protected in any way by laws resembling the Game Laws, which inflict penalties for illegally trespassing to take or kill them. The rooks, while frequenting the rookery, whether it is an ancient or a newly-made rookery, are in the ordinary category of wild animals, and the owner of the estate or ground where the trees grow has no more property in them than any other person. The owner of a rookery once brought an action against a neighbor for shooting at the rooks as they were flying over the neighbor's estate towards the rookery; but the English courts held that no such action was maintainable, for every person may shoot and catch a wild animal upon his own lands, if he pleases. The law is the same in Ireland and Scotland. No person can be given into custody, or fined, or punished by justices of the peace for trespassing in order to shoot at rooks; nevertheless, the owner or occupier of the ground trespassed upon may bring an action of damages against the trespasser.

ROOKE, SIR GEORGE, a distinguished British admiral, was born in the year 1650, near Canterbury, at the country-seat of his father, Sir William Rooke. Having entered the navy, he found himself, at the age of 80, a post-captain; and in 1689, he was promoted to the rank of rear-admiral. He was engaged in the action off Beachy Head between the Earl of Torrington and the French admiral De Tourville; and in 1692, he took part in the memorable battle of La Hogue, fought between the French fleet and the combined English and Dutch force under Admiral Russell. On this occasion, his services were of the most brilliant and dashing character, and in acknowledgment of them, he received the rank of vice-admiral of the red, the honor of knighthood, and a pension of £1000 a year. His next important service was the destruction of a Spanish plate-fleet in the port of Vigo; and in July 1704, in conjunction with Sir Cloudesley Shovel, he accomplished the capture of Gibraltar. Such was the vigor of the operations, that a single week sufficed for the reduction of a fortress, which, as having defied the most formidable, elaborate, and prolonged attack, has since been reputed impregnable. On the 24th August of the same year, he engaged off Malaga a French fleet of much superior force, under the Comte de Toulouse, and fought one of the bloodiest of our naval battles, the honors of which fairly remained with the English, though the escape of the enemy's force rendered it by comparison a barren triumph. The

struggle lasted through nearly a whole day; the French loss was upwards of 3000, the English upwards of 2000 men. On the return of Sir George to England, he was received with marked distinction by Queen Anne; but finding the hostility of the government directed against him on the merely partisan ground of his having previously, as member for Portsmouth, allied himself with the opposition, he resigned his employments, and along with them his seat in parliament; and till his death, which took place on the 24th January 1709, led the life of a quiet country gentleman on the family property in Kent. He was thrice married, and left behind him one son by his second wife.

ROOT, in Botany, sometimes designated the *descending axis* of a plant, that part by which it is fixed to the soil and derives nourishment from the soil. The root is developed in the germination of the seed, at or about the same time with the stem, and forces its way downwards as the stem grows upwards. The root differs from the stem in the irregularity of its ramifications, in the want of a central pith, in the want of buds, in the want of scales or of scars to indicate their former presence, and in the want of stomata. The axis of the root giving off branches, these finally subdivide into *fibrils*, which are little bundles of annular ducts, or sometimes of spiral vessels encased in woody fibre, and covered with a lax cellular integument. The apex of each fibril is sometimes called the *spongiole*: it consists of extremely lax cellular tissue, and has the property of absorbing fluids with great rapidity, thus subserving the nourishment of the plant. See **ENDOSMOSE**.—Aerial roots occur in some plants, as in some *Epiphytes*, the Banyan, Mangroves, &c.; by which nourishment is derived from the air, in addition to that obtained through the leaves and bark, or by which the branches seek to connect themselves anew with the ground, for support and nourishment; and many plants, as Willows, produce adventitious roots very readily, when any portion of the stem or branch is imbedded in moist soil, of which advantage is taken for their artificial propagation.—The central axis of many roots goes deep into the ground in a tapering manner, forming what is called a *tap-root*; other roots have the descending axis very short, and are called *fibrous*. The roots of some plants spread very widely; those of others occupy a very limited space.

The roots of coniferous trees and palms are very small when compared with the appearance of the tree above ground.—Tap-roots sometimes assume a conical form, as in the carrot; others are variously developed in thickness at the upper part, as in the turnip and radish. **TUBERS** (q. v.), **BULBS** (q. v.) and **CORMS** (q. v.) are peculiar developments, evidently intended to secure a store of nourishment for the plant, but which also are very frequently available for the use of man.—Esulent roots are numerous, and many roots also contain secretions either peculiar to themselves, or more abundant than in the other parts of the plant, and become therefore useful in medicine or in the arts, while some are very poisonous. The roots used for food, besides the tubers, bulbs, and corms above mentioned, are generally those which are thick and fleshy. The plants to which they belong are of very different genera and orders—some of the natural order *Crucifera*, as the Turnip and others of the genus *Brassica*—some of the order *Chenopodiaceæ*, as Beet and Mangold Wurzel—some of the order *Umbellifera*, as the Carrot, Parsnip, &c.—some of the order *Leguminosæ*, as the *Pachyrhizos angulatus*, which is cultivated in all parts of the East Indies, and *P. trilobus*, which is cultivated in Cochin China. In many of the lower classes of plants, particularly the Algæ, there is no root whatever, although the plant is often attached by a base.

ROOT, in Philology, is that part which is common to a group of allied words—the germ out of which they have all sprung. It is arrived at by taking away the formative parts—the suffixes and affixes, and reversing any change that their presence may have caused. Thus, in co-in-cid-ence, the root-syllable is *cid*, the primary form of which in Lat. is *cad*, to fall. It is seldom that this analysis can be successfully performed with only one language; in order to get at the true root, the corresponding words in all the languages of the same family must be compared. Thus, in the Eng. words *story*, *history*, *historical*, *historically*, *histor* would seem to be the root; but by comparing the Greek with the Lat. and Sanscrit, we arrive at a syllable *vid*, meaning to see or know, of which the Eng. (to) *wit* (wist) is only another form. And even then we are not sure that we have arrived at the original and most simple form. Thus, Eng. *yoke*, Lat. *jugum*, come from the syllable *jug*, to join, seen in Lat. *ju(n)go*, Gr. *zeugo*; and this might be rested in as the root, were there not a simpler form, *ju*, preserved in Sans., and having the meaning of mingling or being together; this, which may be taken as the primary root, gives rise to the two secondary roots or modifications, *jug*, to join, and *yudh*, to fight (i. e., to join battle).

The roots of the Aryan languages are always monosyllabic, as *i*, to go; *ga*, to go; *ad*, to eat; *vak*, to speak; *star*, to strew. They are divisible into two classes, the one expressing some action

or general property, as in the instances now given; the other indicating relative position, as *ma*, here or me; *ta*, there or that. The one class are called *predicative roots*; the other, *pronominal* (see PRONOUN, PREPOSITION). They all expressed primarily some physical notion or relation palpable to the senses; but from these the transition to the impalpable conceptions of the mind is natural and obvious; thus, *vid*, to see, served also for to know. The notion expressed by a root-word is always of a very general kind; but by a variety of expedients, such as lengthening the vowel, reduplication of the syllable, prefixing and affixing letters and syllables (many of which at least are evidently pronominal roots), and composition with other predicative roots, one germ gives rise to a whole group of words expressive of the specific applications of the generic idea. Thus, from the root *spac* or *spec* (In Gr. *skep*), to look, have sprung a numerous family of words in the English and other kindred tongues; *spy*, *despise* (to look down upon), *spite* (through Fr. *despit*), *respite*, *respectable*, *suspicion*, *prospect*, *inspect*, *auspices*, *speculum*, *species* (i. e., the appearance or individual form, as opposed to the kind or genus), *spices*, &c.

Roots, in the Aryan languages, never enter into speech in their pure and simple form; to make them words, they almost always take on the addition of a pronominal element. Thus, the reduplicate root *da-da*, having the sense of giving, becomes, by the addition of *mi*, my, the word *da-dā-mi*, I give; *vak*, to speak, by affixing *s* (for *sa*, that), becomes *vaks*, in Lat. *vox* (*voxs*), voice (i. e., that speaking). See INFLECTION.

It requires but a few germs to produce, by the processes above described, the most copious vocabulary. The 50,000 words of the Chinese dictionary are formed from 450 roots; those of Hebrew and of Sanscrit are reckoned at about 500; and there are probably not many more in English (see Max Müller's *Lectures*, 1st series, p. 252). The theories as to the origin of the roots themselves, and why a particular thing or notion should have become associated with a particular sound more than with any other, are noticed under PHILOLOGY and ONOMATOPOEIA.

ROOT, in Algebra, denotes any value of the unknown quantity in an equation, which will render both sides of it identical. See EQUATION, INDETERMINATE PROBLEMS, IRREDUCIBLE CASE, &c. The determination of the roots of equations, either formally or actually, constitutes the greater portion of the science of Algebra, while the approximation to roots of those equations whose degree is still beyond a general solution (4th and upwards) forms almost a separate branch of itself. Roots are divided into various classes; they are *real* when they consist of numerical quantities positive or negative; and *imaginary* when they assume the form $a + b\sqrt{-1}$.

ROOT-MILDEW, a name given, not to any well-determined species of fungus, but to certain *mycelia*, which infest the roots of peaches, apples, roses, currants, &c., and cause their death. The tree or shrub is often very suddenly cut down, from apparently perfect health. The roots are found more or less decayed, and covered with filmy white threads. The *mycelium* is supposed to belong to species of *Polyporus*. In some plants, as roses, the state of the bark just above the soil is believed to be premonitory of the disease, which may perhaps then be arrested by washing with a solution of corrosive sublimate. But the mycelium is not easily destroyed, and a tree of the same kind should not be planted where it has proved fatal.

ROOT-PARASITES, plants which grow upon, and derive their nourishment from, the roots of other plants. Such are the Broom-rape (*Orobanchæ*, q. v.), species of *Thesium*, &c., and the *Rafflesias* (q. v.), with other *Rhizanthæ* (q. v.).

ROOT-STOCK, or RHIZOME (*Rhizoma*), in Botany, a stem running along the surface of the ground, partially covered with soil; sending out roots from its lower side, and leaf-buds from its upper. The common yellow iris affords a very perfect example of it. Many ferns have root-stocks. The root-stock is often regarded as a creeping root; it is, really, however, not a root, but a stem.

ROPE AND ROPE-MAKING. Ropes are usually made of vegetable fibres, and differ only from twine in their much greater thickness. The fibre most commonly used in Britain is hemp; but large quantities of plantain fibre, called Manila hemp, made from the leaf-stalks of *Musa textilis*, are also employed, especially for the large ropes used for various purposes on board ships. Ropes consist of many thicknesses of yarn, which is spun by hand in places called rope-walks. The spinner has a large bundle of the fibre loosely gathered round his waist, from which he pulls out a few fibres, and attaches them to a hook in the turning wheel or whirl, which is stationary, and is worked by an assistant. Experience teaches him what number of fibres to draw out, and how to twist them so as to hold firmly on to the hook. He then walks slowly backward down the rope-ground, gradually drawing out or regulating the pulling out of the fibres so as to make an

equal yarn, which receives the necessary twist from the whirl. When he has got to the end of the walk, another spinner takes the yarn from the hook of the whirl, and fixes it to a reel, which is then set in motion; and he attaches a second portion of hemp from his own supply to the hook, and proceeds down the walk as the previous one had done. In the meantime, the first spinner gradually walks up the ground, carefully guiding his length of yarn as it is wound on the reel. When he reaches the reel, it stops, and he waits until the second spinner's length is completed. He then in his turn takes it off the hook, and twists it on to his own; and the reel being again started, receives the additional length from the second man, and so on until the full length required is made up.

The next operation is called *warping*, and consists in stretching out the number of yarns required for a rope. These are all slightly twisted again separately, and stretched to an equal length. Then, if they are intended for tarred ropes, each yarn is drawn separately, either lengthwise or in a hank, through a kettle of hot tar. The superfluous tar is removed by drawing it through a hole lined with oakum. In the next process, called *laying*, two or more yarns are attached to hooks on a whirl, so that when it is turned they will be twisted together the contrary way of the original twist they received in the first spinning. When this is done, it is called a strand. Then as many of these strands as are required for the rope are stretched at full length, and are attached at each end to whirls. One of the whirls has but one hook, to which all the strands are attached; the other has as many hooks as there are strands, one always being central, and a strand is attached to each. The whirls are then put in motion, but in opposite directions, and this causes the outer strands to be laid with great regularity and firmness around the central one. Such is the ordinary process of rope-making; but machines have been invented which produce ropes with such mathematical precision that the strength of the rope may be calculated with great exactness. Captain Huddart has the merit of effecting these improvements; and very few applications of mechanism are more beautiful in their details than those which he has worked out. They, however, do not alter the principle of the manufacture. Within the last few years a great improvement has been patented by Mr. Edward Sang of Edinburgh, and is now in profitable use in the large establishment of the Edinburgh and Leith Ropery Company. It consists of a machine which spins the yarn from material supplied as before by hand, but it does away with the long walk, and can be used in a small room.

Large ropes are either what is called *cable-laid* or *hawsers-laid*. The former consist of three large strands, each made up of three smaller strands. A cable-laid rope of eight inches' circumference is made up in this way of nine strands, each containing thirty-seven original yarns, or altogether 333 yarns. A hawser-laid rope consists of only three strands, each containing a sufficient number of yarns to make up the required thickness. The numerous lives and the vast property depending on the efficiency of ropes employed in shipping have caused a great amount of ingenuity and care to be brought to bear on the manufacture. One very great improvement of modern times has been the introduction of wire-ropes, which are now extensively used in rigging ships, and for other purposes. They are generally made of iron wire, sometimes but not always galvanized. The twisting is effected in the same way as that in which the strands of a hempen rope are laid together.

ROQUE, ST., a popular saint of the Roman Catholic Church in France, who is especially considered the patron of those sick of the plague. Of his history, nevertheless, few particulars have been preserved. He was born of a noble family in Montpellier, early in the 14th, or at the end of the 13th c.; and having undertaken a pilgrimage to Rome, was surprised, upon his way through Italy, by an outbreak of the plague at Piacenza, where he devoted himself with generous zeal to the care of the victims of this pestilence. Falling sick of the plague himself, and abandoned by man, he contrived to drag himself to a neighboring wood, where a dog used to lick his sores; and it pleased God to restore him to health. He returned to France; and after a life of great sanctity, died at Montpellier, probably in 1327.

RO'REE, RORI, or LOHRI, a decayed town of Sind, stands on a picturesque rocky eminence, on the east bank of the Indus, in lat. 27° 38' N. Steamers ply to and from Hyderabad. Cotton and silk fabrics, gold and silver wares, paper, and leather, are manufactured. Pop. (1872) 8580.

RO'RQUAL (*Rorqualus*, *Balaenoptera*, or *Physalus*), a genus of Cetacea of the same family (*Balenidæ*) to which the Greenland whale belongs, and distinguished by having a dorsal fin, which, however, is not large in comparison with the size of the animal, and is pointed, the point directed backward; and also by the form of the head, which, instead of having the upper jaw much arched, as in the Greenland whale, has it in the skeleton nearly straight, the plates of baleen or whalebone being therefore much shorter.

whilst along the throat and belly are many longitudinal folds, allowing of the distention of the integuments so as to form a great pouch for the reception of water and prey, to be afterwards sifted by the plates of baleen. For a long time these folds of the throat

Northern Rorqual.

and belly were a puzzle to naturalists, but their use seems now to be thoroughly ascertained. The form is more elongated than in the Greenland whale, and as the girth of the largest rorquals has been found equal to that of the largest Greenland whales, the rorquals appear to be the largest of the Cetacea, and indeed of all animals at present existing in the world.

The northern R. sometimes rather exceeds 100 feet in length. Concerning the species of this genus, there is great doubt and uncertainty. Some naturalists confidently assert the existence of several species in the northern seas, and a genus *Rorqualus* or *Physalus*, has been constituted distinct from *Balenoptera*, the largest species being referred to the former; and a smaller one, said not to exceed 25 feet in length, and known as the *Pike Whale*, from the resemblance of the mouth to that of a pike, being assigned to the latter. Other naturalists of no mean reputation doubt if the Pike Whale (*Balenoptera rostrata*, or *B. musculus*) is anything else than the young of the Great Northern R. (*R. Boops*), the *Fin-fish* or *Razor-back* of whalers. The question was supposed to have been determined by Mr. F. Knox, of Edinburgh, who found the number of vertebrae to be different in specimens cast upon the Scottish shores; but the number of vertebrae has been found so different in other specimens examined, that either this must be a comparatively unimportant character, or the number of species must be greater than has been supposed. The northern R. is of a slate-gray color, whitish beneath. It is found in the arctic seas, visiting also those of the northern temperate regions, and is not very unfrequent on the coasts of Britain. When it comes to the surface of the water to blow, it does not lie motionless, as the Greenland whale usually does, but swims at the rate of about five miles an hour, and in blowing, it makes a prodigious noise. Its speed, when harpooned, is very great.

Scoresby mentions an instance of one carrying out 3000 feet of line in a minute. It is not easily captured; and whalers dislike it, because the Greenland whale is seldom found near it, whilst its own value is very inferior, owing to the comparative thinness of the blubber, and the shortness and inferior quality of the whalebone. It is, however, an important object of pursuit to the Laplanders and Greenlanders, who wear it out by assailing it with weapon after weapon, and finally divide the spoil. A large R. yields 4000 gallons of oil.—The R. does not feed so exclusively on small prey—calcephæ, molluscs, &c.—as the Greenland whale. Its gullet is much wider, and it preys much on fishes, the shoals of which it follows into bays and estuaries, devouring them in multitudes. The stomach of a R. has been found to contain 600 large cod, and a great quantity of pilchards. One which frequented the Firth of Forth for 20 years was well known to the fishermen there, and much detested by them. It was at last stranded at Abercorn in 1692. It was 78 feet long.—In the southern seas, another, species of R. is found (*R. B.*, or *P. Australis*), which has a long dorsal fin, placed further forward than in the northern rorqual. It attains a large size. The South Sea whalers do not care to pursue it. Its range seems to extend to the northern hemisphere in the Pacific.

ROSA, SALVATOR, was born at Renella, in the neighborhood of Naples, in 1615. His first instructor was Francesco Francanzani, who had married his sister. Some of his landscapes attracted the notice of Lanfranco, who purchasing them, enabled and encouraged the young artist to pursue his studies. He became a pupil of Aniello Falcone, a painter of battle-pieces, and afterwards of Spagnoletto. Having gone to Rome, he was employed to paint an altar-piece and some other works by the Neapolitan cardinal Brancacci, and he accompanied Prince Carlo de' Medici to Florence, and executed several important works for him. He finally settled in Rome in 1638, and died there, March 15, 1673. Salvator has a great reputation as a painter, and

he owes this mainly to his landscapes, which, though faulty in many respects, arrest attention by originality in subject and treatment, being generally representations of wild and savage scenes, executed with a freedom and decision remarkably appropriate. Salvator executed numerous etchings, highly characteristic of his peculiar style.

ROSA'CEA, known also as GUTTA ROSEA and ACNE ROSACEA, is a disease which usually first appears at or near the end of the nose; and in some cases it is confined to the nose, while in others it extends to the cheeks, forehead, chin, or even to the whole face. The skin in the part affected assumes a deep red color, which usually disappears after a time, but returns either on no special provocation, or in consequence, apparently, of some gastric disturbance, and after a time becomes permanent; pustules of acne—a chronic pustular disease of the skin—now appear, and their yellowness contrasts strongly with the redness with which they are surrounded. The skin of the diseased part becomes irregularly swollen, and is marked with blue or red streaks, caused by congestion and enlargement of the capillaries; the whole surface, in a severe case, presenting a very disagreeable and repulsive appearance. This affection is no doubt often a result of intemperate living, but it may occur in persons of regular habits of life. Disorder of the digestive system is so often associated with it, as to exclude the idea that the combination is accidental, and the skin disease may often with great probability be referred to gastric disturbance as the exciting cause. The disease is confined almost exclusively to persons in middle or advanced life, and women are especially liable to it about the period in which what is popularly known as the 'change of life' occurs: moreover, it has occasionally been observed to be hereditary.

The general treatment consists in the administration of the compounds of iodine and mercury (singly or conjoined) in alterative doses, and Donovan's Solution has been especially recommended; and a nourishing but bland and non-stimulating diet should be prescribed. In the early stages of the disease, the local treatment should be soothing. Emollient lotions, such as emulsion of bitter almonds, cream, glycerine, &c., may be occasionally used during the day, and in severe cases a bread poultice may be applied to the face at night. When the affection becomes indolent, the emollients should be gradually replaced by stimulating applications, such as Eau de Cologne, or a solution of corrosive sublimate in alcohol, in the proportion of from 1 to 2 grains in the pint; and at a still later stage, iodide of sulphur ointment, in the proportion of 15 grains or a scruple of the iodide to an ounce of lard, is well deserving of a trial. When the disease is of long standing, it sometimes defies all known remedies.

ROSACEÆ, a natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics, they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphrodite, but sometimes unisexual; the inflorescence various. The calyx is 4—5-lobed, generally 5-lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx; the ovary sometimes solitary, sometimes there are several ovaries; each one-celled, with a lateral style; or a number of ovaries are united into a many-celled pistil; the ovules generally two or more.

The fruit is sometimes a drupe; sometimes a pome; sometimes follicular; sometimes an achæmium; sometimes a heap of achænia, or of one-seeded berries; sometimes a heap of achænia, covered with the fleshy tubes of the calyx.—This natural order contains at least 1000 known species; but in some of the genera, as *Rosa* and *Rubus*, the determination of the species is attended with great difficulty, and varieties—sometimes reckoned species—are numerous.—The order, as generally received, is divided into a number of sub-orders, several of which have by some botanists been elevated to the rank of distinct orders, as *Amygdaleæ*, *Pomaceæ*, *Sanguisorbeæ*. See also ROSE, RUBUS, STRAWBERRY, POTENTILLA, TORMENTIL, AGRIMONY, GEUM, SPIRÆA, CUSSO, &c.

ROSA' RIO, a town of the Argentine Republic, on the right bank of the Parana, 170 miles north-west from Buenos Ayres, 210 miles by river. It is the most important town on the Parana, and is rapidly increasing in population and commerce. The customs duties amount to considerably over £140,000 a year. In 1874 the value of merchandise imported direct was \$7,046,400; of the exports, \$2,101,100, of which \$1,073,540 consisted of wool, hides, &c., sent to the United States. Pop. above 40,000.

ROSARY OF THE BLESSED VIRGIN MARY (Lat. *rosarium*, a chaplet of roses), the name given to a very popular form of prayer in the Roman Catholic Church. The name rosary has

been variously traced either to the title 'Mystical Rose,' one of the titles under which the Blessed Virgin is addressed in the Litany of Loretto (q. v.), or to St. Rosalia's wreath of roses, well known in sacred art, or to the beads being originally made commonly of rosewood. The origin of the devotion itself is popularly traced to St. Dominick (q. v.); but it is quite certain that its characteristic feature, the use of beads as a means of reckoning the number of repetitions of a certain prayer, is of far greater antiquity. See BEADS. Palladius tells of the Abbot Paul, whose daily practice it was to repeat the Paternoster 300 times, that he used a number of small pebbles to secure a correct enumeration, dropping one of these into his lap at each repetition. Later, a string of beads, worn round the neck, and called *Beitidum*, was substituted. As the same use of beads exists among the Mohammedans, some writers have traced the Roman Catholic practice to a Mohammedan origin; but it appears quite certain that the practice existed among Christians before the time of Mohammed. Originally, the prayer so repeated was the Lord's Prayer; but when, in the 11th and 12th centuries, the so-called angelical salutation: 'Hail, Mary!' &c., became a frequent form of prayer, it was added to the 'Our Father;' and it seems beyond all doubt that the rosary in its present form was, if not devised, at least fully introduced and propagated by St. Dominick.

The rosary, although called of the Blessed Virgin Mary, is a series of fifteen prayers, founded on the chief mysteries of the incarnation and passion of our Lord, interspersed with repetitions of the 'Our Father,' the 'Hail, Mary!' and the doxology. It consists of three parts, each of which contains five so-called mysteries, connected with our Lord's incarnation and public mission on earth, his passion and death, his resurrection and ascension, and the assumption of the Blessed Virgin Mary. Each of these parts thus contains five mysteries (called also 'decades' from the ten 'Hail, Marys') consisting of (1) a 'meditation,' briefly proposing the mystery which is to be meditated upon; (2), one 'Our Father;' (3), two 'Hail, Marys;' (4), one doxology; (5), a prayer begging for the special grace or fruit appropriate to the particular mystery. The whole rosary, therefore, consists of 15 mysteries or decades, and thus comprises 15 'Our Fathers' and 'Doxologies,' and 150 'Hail, Marys.' The devotion of the rosary takes several forms. The 'Greater Rosary' consists of the recitation of the whole fifteen mysteries or decades, with their component prayers. The 'Lesser Rosary' consists of one of the three parts, or of five mysteries or decades. The 'Living Rosary' is recited by an association of fifteen individuals, each of whom engages to say daily one mystery. When recited publicly, the prayers are repeated alternately by the priest or other person presiding at prayer, and by the congregation. There is a form of the rosary common in foreign countries, especially Germany, in which the substance of each 'mystery' is condensed into a short prayer of three or four words, which are appended to the 'Hail, Mary!' and thus serve perpetually to recall the subject to the mind of the person praying vocally.

The rosary has been sanctioned and recommended by numberless popes and other ecclesiastical authorities, and Indulgences (q. v.) have been granted to persons reciting it with proper dispositions. It is regarded by Roman Catholics as one of their most excellent forms of prayer, and as placing the devotion to the Blessed Virgin Mary on its true footing—that of a devotion to the incarnation and death of her son, Jesus Christ. It is expressly recommended for the poor and the ignorant; and there are instructions specially designed for these classes, in order to enable them to combine prayer of the mind with prayer of the lips.

The mechanical instrument, so to speak, of this devotion is also called by the name rosary. It consists of a string of beads, equal in number to the 'Our Fathers' and 'Hail, Marys' which are recited in the rosary—the 'Our Father' beads being of a larger size—one of which is passed through the fingers at each recitation of the prayer, and thus secures the person praying from errors of memory. The beads are of various material—berries, wood, stone, ivory, metal, &c., and are often of costly workmanship, and of considerable intrinsic value. They are blessed for the use of the people by the pope, by bishops and superiors of religious orders, and by others having special power for the purpose.

ROSAS, DON JUAN MANUEL, president of the Argentine Confederation, born at Buenos Ayres in 1793, descended from an ancient family of the Asturias. He entered the army of Buenos Ayres and in 1829 rose to be governor or captain-general of his native province, then in federal union with Entre Rios, Corrientes, and Santa Fé. He showed great courage and capacity in subduing the disaffected Indians, and internal peace being thus secured, he turned his attention to the state of the confederation, which, in 1835, was falling to pieces by the feebleness of its governments. A single president was, upon his recommendation, elected for the whole Argentine Confederation, and the choice fell upon Rosas. His residence was to be Buenos Ayres, and to this state were intrusted the external relations of the Confedera-

tion, and the management of the more important functions of the executive. Intense commotion subsided under his rule, the industrial resources of the country were developed, and foreign commerce rapidly increased. The other states, however, became jealous of the growth and power of Buenos Ayres, and R. was accused of a design to extend and uphold the undue predominance of his state, and to give his native city a monopoly of the trade of the River Plate. In the execution of this design, he sought to compel Paraguay to join the Confederation. This involved R. in a war with Brazil, in which his troops were outnumbered, yet he obstinately kept up the struggle for five years. An attack on Monte Video was also rendered necessary by his policy; but England and France interfering for the protection of that city, R. was again defeated; yet he managed to resist the allied forces from 1845 to 1850. His rule had by this time become so oppressive and intolerable, that the subject states revolted, and selected Don J. J. Urquiza as their president and general.

A battle ensued at Monte-Caseros, 3d February 1852, when R.'s forces were put to flight. Urquiza entered Buenos Ayres as president of the Confederation; and R., who was compelled to flee, obtained a refuge in England, in which country he for the most part resided till his death in March 1877.

RO'SCIUS, QUINTUS, was born at Solonium, a village near Lanuvium, and rose to be the greatest comic actor in Rome. So much was he admired, that many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favor, presented him with a gold ring, the symbol of the equestrian order. Among his most admiring and affectionate patrons, R. also numbered Cicero, who, at the commencement of his career, received lessons in the art of elocution from the great comedian, and even in later life used to make trials of skill with his instructor as to which of them rendered a thought most clearly and effectively—the orator by his diction, or the comedian by his gesticulation. So sensible was R. of the distinction he enjoyed in sharing the intimacy, and even the friendly emulation of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the comparative methods and merits of eloquence and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chæren for the sum of 50,000 sesterces, Cicero defended him before the judex Piso (probably 68 B.C.) in his extant oration, *Pro Q. Roscio Comedo*. He died 62 B.C., having attained such perfection in his peculiar art, that to be a 'Roscius' became synonymous with pre-eminence in every profession, and leaving, like his famous contemporary, Æsopos the tragedian, an immense fortune, realized upon the stage.

ROSCOE, WILLIAM, the eminent historian of Lorenzo de' Medici and Leo X., was born near Liverpool on the 8th of March 1753. His father was a market-gardener, whose assistant in this business he became in his twelfth year, after receiving the rudiments of learning at a common school. In this occupation he continued for about three years, during which his fondness for reading developed itself; and in 1769, after making trial for a year of a bookseller's shop, he was articled to an attorney at Liverpool, where, in 1774, being admitted an attorney of the Court of King's Bench, he began to practice on his own account. During all this period, he assiduously cultivated his mental powers, turning his attention to the classics, and especially to the Italian language and literature. In 1773, he first appeared in print as the author of a poem; and in 1777, a collection of some of his earlier pieces was published, containing his first protest against the slave-trade, of which, throughout his life, he was a strenuous opponent. In 1796 was published the first volume of his *Life of Lorenzo de' Medici, called the Magnificent*, which had been begun many years before, and in the composition of which he was greatly aided by the collection for him of valuable materials in Italy, from sources in print and manuscript, by his friend Mr. Clarke. The success of this work was extraordinary, and it at once established his literary reputation. The work was received with the highest approbation by those who were best able to appreciate its merits, both in England and on the continent, especially in Italy; it went through several editions, and was translated into German, French, and Italian.

In 1805, appeared his second great work, the *Life and Pontificate of Leo X.*, for which, with the assistance of others, he had been collecting materials for many years. This work also, which, like the former, appeared successively in German, French, and Italian, was received with much commendation by the most impartial judges, though its tone and spirit, especially with reference to the Reformation, were severely criticised by others.

R. at one time had thoughts of adopting the bar as a profession; but about the year 1800, he became partner in a Liverpool bank, a step which involved him eventually in great pecuniary embarrassment. In 1806, he was returned to parliament for Liverpool in the Whig interest, and had the gratification of taking part in the abolition of the slave-trade, but did not again come

forward after the dissolution in 1807. He was, throughout, a consistent opponent of the war with France, against which he published several pamphlets, and was on all points the advocate of liberal opinions. He took an active part in founding the Liverpool Royal Institution, and was a zealous promoter of literature, and patron of the fine arts. R. died at Liverpool, June 30, 1831. During the latter years of his life, he devoted himself much to the study of botany, and in honor of him, a rare genus of Monandrian plants received in 1826 the name *Roscoe*.

ROSCOMMON, an inland county of Ireland, in the east of the province of Connaught, and bounded on the east by the river Shannon, is 60 miles long from north to south, by 40 miles from east to west. Area, 607,691 acres, of which 440,522 are arable. Pop. (1881) 131,755. 737 persons speak Irish only. Number of pupils on the roll of the National Schools in 1880, 33,925 (of whom 33,245 were Roman Catholics). Number of emigrants from R. between 1851 and 1871, 52,299. The surface of R., which belongs to the central plains of Ireland, is level, with undulations rising in the south into the Slieve Bawn range, the highest point of which is 867 feet in height; and on the north, into the Curlew Mountains, of which Slieve Curragh attains a height of 1093 feet. Its principal rivers are the Shannon (q. v.) and the Suck. R. communicates by means of the Midland Great Western, the Southern and Western, and North-western railways, with all the extremities of the kingdom. In geological structure it belongs to the central limestone formation, in some districts of which the sandstone protrudes. The soil in the central district is in general light, but fertile, and affords the finest sheep-pasture in Ireland—the celebrated 'Plain of Boyle.' Some portions also contain a rich and fertile loam, which produces good cereal crops; but the chief industry of the R. farming population is the feeding of sheep and cattle, especially the former.—The county can hardly be said to possess any manufacture worthy of mention. The chief towns are Roscommon (q. v.), Boyle, Castlereagh, Elphin, Strokestown. Ballinasloe and Athlone lie upon the border, and are partly within this county. R., in the ante-English period, was the country of the sept of MacDermot, O'Daly, O'Kelly, and above all, O'Connor, of which there were two branches, that of the O'Connor Roe (red), and that of O'Connor Don or Dhuin (brown). The present representative of the O'Connors, the O'Connor Don, is one of the very few Irish princes who have succeeded to the hereditary estates of their ancestors.

R. sends two members to the imperial parliament. It possesses a vast number of antiquities of the Celtic period, raths, &c.; a portion of a round tower at Oran, several remains of strong castles of the English period, and some fine ecclesiastical ruins, of which Boyle Roscommon, Tulsk, and Clonshanville are the principal.

ROSCOMMON, the capital and assize town of the county of the same name, Ireland, in the middle of the county, 96 miles west-by-north from Dublin. The population, in 1861, was 2699; in 1881, 2117. Of the inhabitants less than 300 are Protestants. R. dates from the 13th c., when it arose around a Dominican abbey, founded by the O'Connor in 1257, and a castle built soon after by Sir Robert de Ufford, the remains of both of which structures still exist. R. is a market-town, in which corn is the principal commodity. It has scarcely any manufacture, and little commercial enterprise of any kind. It returned two members to the Irish parliament, but was disfranchised at the Union. Two newspapers are published here.

ROSCREA', a market-town of the county of Tipperary, Ireland, 94 miles south-west-by-west from Dublin, with which it is connected by a branch from the Great Southern and Western Railway. The population in 1861 was 3543; in 1881, 2801. Of this number over 400 were Protestants of the Episcopal Church. R. is a very ancient town, dating back to the early Christian period, when a monastery was built upon this site in the beginning of the 7th century. The modern town is tolerably well built; the Roman Catholic Church is a handsome structure; and there are considerable remains of the ancient greatness of the place—a castle, a lofty round tower, 80 feet high, and ruins of two abbeys. The only manufacture is coarse woollen cloth, but there is a considerable market for agricultural produce. There are several schools, some with endowments of ancient date.

ROSE (*Rosa*), a genus of plants of the natural order *Rosaceæ*, consisting of shrubs, generally with prickly stems and pinnate leaves, the leaves terminating in a single leaflet; stipules at the base of the leaf-stalks; the calyx 5-fid, its tube contracted at the summit, and finally becoming fleshy, and forming a chief part of the fruit; the corolla of five petals; the stamens numerous; the styles springing from the narrowed throat of the calyx, free, or aggregated into a column. The flowers are generally of the red tint well known as *rose-color*, but sometimes white, more rarely yellow, and sometimes striped. The fruit (*Hip* or *Hep*) consists of the enlarged and colored tube of the calyx, within which are contained many *Achenia* (q. v.) amidst prickly hairs. The species are very

numerous, even after allowance has been made for a great number of varieties elevated into species. There is no genus of plants in which the limits of species are more difficult to define, or in which varieties are more apt to be regarded as species. In Withering's *British Botany*, published near the end of last century, only five British species of R. are given; in Hooker and Arnott's *British Flora*, 19 species are recognized, whilst many forms, reckoned as species by some botanists, are noticed as mere varieties. Roses are natives of all the temperate parts of the northern hemisphere, and of its colder regions, even to Lapland and Hudson's Bay. They have long been among the chief favorites in flower-gardens, for the beauty and fragrance of their flowers; and, more than any other flower, emblems of everything beautiful and delightful.

Countless varieties—single and double—have been produced by cultivation, which it is often extremely difficult to refer to their original species.—Amongst the ancients, the R. was sacred to Eros or Cupid, and Aphrodite or Venus, and was accounted the emblem of joy and love, and at the same time of prudence. Its opening buds are a favorite poetic image of innocence and purity.—Among the roses best known to the ancients was the HUNDRED-LEAVED R. (*R. centifolia*), excelled by no other species in beauty and fragrance. It is a native of the Caucasus, and has been cultivated in gardens from very ancient times. Amongst its numberless varieties are the Moss R., the calyx of which sends forth branching excrescences, so that it seems overgrown with moss, the flower—which is only known as a double rose—being exquisitely beautiful and fragrant; the PROVERGE or CABBAGE R., one of the most common, and also one of the finest roses; the small-flowered BURGUNDY R. &c.—The FRENCH R. (*R. Gallica*) is a native of the south of Europe. Many varieties of it are cultivated, particularly very beautiful double ones. It is distinguished by its hard leaves, which have a peculiar dryness, and its much expanded petals. It has a fainter smell than *R. centifolia*, but its petals are more astringent, and are preferred for the preparation of *Vinegar of Roses* and *Conserve of Roses*.—The DAMASCUS or DAMASK R. (*R. Damascena*), a native of Syria, is much cultivated, and is sometimes called the MONTHLY R., which name, however, is more frequently given to the China Rose.

The MUSK R. (*R. moschata*) is a native of the north of Africa and the south of Spain. Its flowers have a strong and delightful fragrance; they are white, and disposed in rich corymbs. It has been cultivated in England since the end of the 16th century.—The DOG R. (*R. canina*) is common in Britain, and throughout Europe, also in the north of Asia, growing in thickets and hedges. It varies, even in a wild state, in the color of its flowers, which are red, pale, or white. It has long straight shoots, which are often used as stocks for ornamental rose-trees, other kinds of R. being budded upon them. The bark of the root was formerly esteemed of peculiar virtue in preventing fatal consequences from the bite of a mad dog; whence the name of the species.—The VILLOUS R. (*R. villosa*), another common British species, has the fruit larger and more fleshy than the Dog Rose. The leaves are downy.—The FIELD R. (*R. arvensis*) is common in many parts of Britain, in woods and hedges. It has white flowers. It is remarkable for its trailing habit, and long climbing or pendulous twigs, on account of which it is frequently planted and trained to cover walls and trellises. It is often called the AYRSHIRE R., although that name is shared by another kind of similar habit, which is regarded as a deciduous variety of the EVERGREEN R. (*R. sempervirens*), a native of the south of Europe. These often make shoots of 20 feet in a season. Of the same habit also is the MANY-FLOWERED R. (*R. multiflora*), a native of China and Japan, a very fine species, but not sufficiently hardy for the colder parts of Britain.

Very different in habit is the SCOTCH R., or BURNET-LEAVED R. (*R. spinosissima*), a species common on heaths, sands, and chalk downs, in many parts of Britain; a low compact bush, with very small leaves and flowers. It is occasionally found in unfertile situations, so dwarfed in size as not to measure more than three inches from the very tip of the root to the center of the flower (which is undiminished in size). Many fine double varieties are now in cultivation.—The ALPINE R. (*R. Alpina*) is a beautiful ornament of the Alps and of other mountains of Central Europe, remarkable for its flower-stalks bending down in an arch after flowering.—The SWEET BRIER R. (*R. rubiginosa*) is a bushy species, with small leaves and flowers, a native of Britain, but more common in some parts of continental Europe, growing in open bushy places, and remarkable for the sweet balsamic smell of its leaves, on account of which it is much planted in hedges and shrubberies. A kindred species (*R. suaveolens*) is found in North America.—The YELLOW R. (*R. lutea*), a native of Germany, is chiefly remarkable for the color of its flowers, which, however, have a disagreeable bug-like odor. A fine variety is much cultivated, with petals yellow externally, and bright red on the inside.—The INDIAN R., or CHINA R. (*R. Indica*), is a native of China, was thence carried to India, and is now also common in Europe,

being a hardy plant, which does not suffer from the frosts of winter in any part of Britain, although it was at first introduced as a greenhouse plant. It is one of the most important additions recently made to our flower-gardens and shrubberies; flowering not only in the middle of summer, with the other roses, but throughout the year, even in winter, when the weather is mild. It is now very common throughout Europe. The name MONTHLY R. is often given to it from a notion that it flowers every month.

The NOISETE R., remarkable for its extremely rich corymbs, and the TEA R., of which the dried leaves have a fine fragrance, and are said to be used in China for flavoring tea, are regarded as varieties of it. The odor of the flower is much fainter than that of many other roses; and the bush is never large.

Some kinds of R., as the China R., are easily propagated by cuttings, the other kinds by layers. The finer varieties are budded on stocks of some common kind. Many of the kinds require much pruning and attention of the gardener. The old shoots are cut out, and the young wood thinned and shortened. The flowering of a rose-bush may be retarded by cutting it closely down late in spring, and it will blossom when other roses have disappeared. Roses grow well in all ordinary soils, but are very sensitive to atmospheric influences, and do not succeed amidst the smoke of towns.

The genus *Lovoa* has been separated from *Rosa* by Lindley, chiefly on account of the simple leaves. The only known species is a native of Central Asia.

The fruit of roses is used in medicine. See HIP. A mildly astringent and agreeable syrup, and other preparations, are made from the rapidly dried petals and buds of the French rose. A syrup is similarly made from the petals of the Hundred-leaved R.; and water distilled from them, *Rose Water*, is employed for various purposes on account of its agreeable odor. *Rose Vinegar*, made by steeping rose petals in vinegar, is useful as an external application in headaches, for dissipating unpleasant smells in apartments, &c. *Conserve of Roses* is made of the petals of roses pounded with sugar, and is useful as an astringent in diarrhoea of children. Oil or Otto (q. v.) of Roses is one of the most valuable of perfumes.

Rose-bushes are often much injured by a species of Aphis (*A. rosa*), a small green insect, which swarms upon the leaves. A reddish fungus, *Puccinia rosa*, often covers the leaves in the latter part of summer.

ROSE, in Heraldry. The heraldic rose is drawn in a conventional form, as in the subjoined woodcut, and never with a stalk, except when expressly directed by the words of blazon. Being sometimes argent and sometimes gules, it cannot be designated proper; but when blazoned 'barbed and seeded proper,' it is meant that the barbs are to be green, and the seeds gold or yellow. The rose gules was the badge of the Plantagenets of the House of Lancaster, and the rose argent of that of York. The York rose was sometimes surrounded with rays as of the sun, and termed *rose en soleil*. As a mark of cadency, the rose has been used as the difference of the seventh son.

Rose.

ROSE, THE, a popular name for Erysipelas (q. v.), which is also known as St. Anthony's Fire, *Ignis Sacer*, &c.

ROSE ACACIA. See ROBINIA.

ROSE APPLE. See EUGENIA.

ROSE BEETLE (*Cetonia aurata*), a coleopterous insect of the section *Pentamera*, of the tribe *Lamellicornes*, and not distantly allied to cockchafers and to the true beetles, or *Scarabaei*. It is a common British insect, about an inch long, of a shiny green above, coppery red underneath, with white marks on the elytra. In its perfect state it frequents flowers, particularly the rose; in its larva state, it inhabits rotten timber, the roots of vines, &c., and is often found in ants' nests, apparently feeding on the small particles of wood which the ants have collected. It remains about three years in the larva state, makes a cocoon of particles of wood, glued together by an excretion of its own; passes the winter as an inactive pupa, and appears in summer in its perfect form. It flies well, with a sort of humming noise, from flower to flower, feeding on honey, and in order to reach it, devouring the nectar. In North America, the name Rose Beetle is given to another coleopterous insect of the tribe *Clavicornes*, about one-third of an inch in length. It is very injurious to gardens and nurseries in North America, its ravages extending to many plants besides the rose. These insects often appear suddenly in swarms, and disappear as suddenly.

ROSE-ENGINE. See TURNING.

ROSE-MARY (*Rosmarinus*), a genus of plants of the natural order *Labiata*, and nearly allied to Sage (*Salvia*), from which it differs in its filaments having an awl-shaped tooth, directed downwards a little above the base. Only one species is known, *R. officinalis*, an evergreen erect shrub of 4—8 feet high, with linear

leaves, and pale bluish flowers, growing in sunny places on rocks, old walls, &c., in the countries around the Mediterranean Sea, and generally cultivated, as an ornamental and aromatic shrub, throughout the rest of Europe. The leaves have a short whitish-gray down beneath, a penetrating camphor-like odor, and

Rosemary (*Rosmarinus officinalis*).

a pungent aromatic and bitter taste. They contain a large quantity of an essential oil, *Oil of R.* ($C_{10}H_{16}O_2$), which is not unfrequently used as a stimulating liniment, to promote the growth of the hair, and as a perfume. *Spirit of R.*, made by distillation of sprigs of R. with rectified spirit, is used to give a pleasant odor to lotions and liniments. R. has been advantageously administered internally in cases of chronic diarrhoea, and of a relaxed state of the system.—Oil of R. is a principal ingredient of the perfume called *Hungary Water*, or *Queen of Hungary's Water*.—The name Wild R. is given to *Ledum palustre*, a shrub with narcotic acid properties.

ROSEN, FRIEDR. AUG., born in Hanover, September 2, 1805, entered Leipzig University in 1822, where he devoted himself to the study of the biblico-oriental languages, and went to Berlin in 1824, where he studied Sanscrit under Bopp, and published his first work, *Radices Sanscritæ* (Berl. 1827). Subsequently, he was called to London University as Professor of Oriental Literature, where he edited the oldest of the still extant Arabic handbooks of Algebra, by Mohammed ben Musa (Lond. 1831). In 1831, R. resigned his professorship. During the next few years, he wrote a portion of the oriental articles for the *Penny Cyclopædia*, undertook the revision of the Sanscrit Bengali Dictionary of Houghton (Lond. 1835), which may be considered entirely his own work, and compiled for the British Museum the catalogue of Syrian manuscripts, which was only published after his death (Lond. 1839). As secretary of the Asiatic Society, he conducted its entire foreign correspondence. Colebrooke intrusted to him the publication of his *Miscellaneous Essays* (2 vols., Lond. 1837). In 1836, he had begun the publication of the Collection of Hymns of the *Rigveda*, when he died September 12, 1837. His unfinished work on the Vedas was published by the Asiatic Society under the title *Rigveda-Sanhita, liber primus, Sanscrit et Latine* (Lond. 1838).—His younger brother, GEORG ROSEN, has also acquired a reputation as an oriental scholar.

ROSENAU, a town of Hungary, beautifully situated on the Sajó, 105 miles north-east of Pesth. It has colleges and a Franciscan convent. There is mining done in the neighborhood, and there are manufactures of woollen cloth and linen, of stone-ware, leather, and paper. Pop. (1869) 4855.

ROSENMÜLLER, JOHANN GEORG, a German divine and professor of theology, was born at Uimmerstädt in Hildburghausen, 18th December 1736. He was appointed Professor of Theology at Erlangen in 1773, Primarius Professor of Divinity at Glessen in 1783, and was called in 1785 to Leipzig, where he remained till his death in 1815. His chief writings are: *Morgan- und Abendandachten* (7th ed. Leip. 1820); *Betrachtungen über die vornehmsten Wahrheiten der Religion auf alle Tage des Jahres* (4 vols. Leip. 1801); *Auserlesenes Beicht- und Communionsbuch* (12th ed. Nürnberg. 1827); *Predigten über auserlesene Stellen der Heiligen Schrift* (3 vols. Leip. 1811—1813); *Beiträge zur Homiletik* (Leip. 1814); *Scholia in Novum Testamentum* (6 vols.; 6th ed. by his son, E. F. K. Rosenmüller, Leip. 1815—1831); and his *Historia Interpretationis Librorum Sacrorum in Ecclesia Christiana* (5 vols. Leip. 1795—1814). After his death appeared *Handbuch eines allgemeinen fasslichen Un-*

terrichts in der Christlichen Glaubens- und Sittenlehre (2 vols. Leip. 1818—1819).—ERNST FRIEDRICH KARL ROSENMULLER eldest son of the foregoing, distinguished himself as a biblical critic and orientalist. He was born at Hesseberg in Hildburghausen, 10th December, 1768, studied at Leipzig, became Extraordinary Professor of Oriental Literature in 1795, Ordinary Professor in 1813, and died 17th September 1835. He was a more accurate and solid scholar and a keener critic than his father. He shared the rationalism of his time, but never carried it to an extreme. His Masterpiece, the *Scholia in Vetus Testamentum* (11 vols. Leip. 1788—1835), is a most comprehensive and learned production, well worthy of consultation on any important point of biblical criticism. Other works of R.'s are: *Handbuch für die Literatur der biblischen Kritik und Exegese* (4 vols. Gött. 1797—1800); *Das alte und neue Morgenland oder Erläuterungen der Heiligen Schrift* (6 vols. Leip. 1818—1820); *Handbuch der biblischen Alterthumskunde* (4 vols. Leip. 1823—1831); *Institutiones ad Fundamenta Lingue Arabicæ* (Leip. 1818); and *Analecta Arabica* (2 vols. Leip. 1825—1826).—A younger brother, JOHANN CHRISTIAN ROSENMULLER (b. 1771, d. 1820), also acquired a reputation as a writer on anatomy, &c.

ROSE-NOBLE (commonly called also *penny of gold*), an English gold coin, first struck by King Edward III. in 1334, and current at the value of 6s. 8d. sterling; half-nobles, *obols*, or gold half-pence, and quarter-nobles, otherwise called *gold farthings* and *quadrantes*, were also coined soon after. The term 'rose-noble' was given to the coin because it was of the same value as the 'noble,' a money of account, and was stamped on one side with the figure of a rose. The Rose-noble and its halves and quarters ceased to be coined after 9 Henry V.; but the 'noble,' the money of account, was used till a much more recent period.—The noble also existed in the Scotch coinage, and was equivalent to one-twelfth of the English coin.

ROSE OF JERICHO (*Anastatica hierochuntica*), a plant of the natural order *Crucifera*, which grows in the sandy deserts of Arabia; and on rubbish, the roofs of houses, and other such situations, in Syria and other parts of the East. It is a small, bushy, herbaceous plant, seldom more than six inches high; with small white flowers; and after it has flowered, the leaves fall off, and the branches become incurved towards the center, so that the plant assumes an almost globular form, and in this state it is often blown about by the wind in the desert. When it happens to be blown into water, the branches expand again, and the pods open and let out the seeds. Numerous superstitious are connected with this plant, which is called *Rosa Maris*, or *Rose of the Virgin*. If taken up before it is quite withered, the plant retains its hygroscopic property of contracting in drought and expanding in moisture, for years.

ROSEOLA is a common skin disease, included in the division *Rashes*, and sometimes described under the term *Scarlet Rash*. In some cases, it begins with slight febrile symptoms and gastric disturbance, which subside in two or three days, when the rash appears; in other cases, no preliminary fever occurs. The eruption first appears upon the face, neck, and chest, in specks or small patches, which have a tendency to coalesce; and in severe cases, the whole surface of the body assumes a uniformly red tint. The eruption is usually accompanied by itching of the affected parts, and by redness and slight soreness of the throat, and seldom lasts more than two or three days, when it gradually fades away; and its disappearance is not followed by the desquamation of epidermis, which is one of the natural *sequela* of scarlatina and certain other skin diseases. The rash differs considerably in appearance in different cases. The disease is never contagious, and one attack affords no immunity from a second.

Among the causes of roseola may be mentioned the irritation excited by dentition, gastric and intestinal irritation, excessive acidity of the stomach, the sudden checking of profuse perspiration, the drinking of cold water when the body is overheated, &c. It often precedes the distinctive eruptions of small-pox and varioloid; and is noticed to be of most frequent occurrence during the prevalence of measles and scarlatina. The diseases with which it may be confounded are erythema, measles, and scarlatina, and it is sometimes impossible to discriminate with certainty between roseola and mild cases of scarlatina, when the former is attended with sore throat. The treatment is very simple, as the disease would probably always terminate favorably if left entirely to itself. If there is a suspicion that the case should turn out to be one of scarlatina, an emetic of ipecacuanha should be given, and the bowels should be freely acted on. In ordinary cases, a few days' confinement to the house, a spare and non-stimulating diet, saline laxatives—such as Seidlitz powders—and an occasional warm bath, if there is much cutaneous irritation, or if the eruption has a tendency to recede too suddenly, constitute all the treatment that is expedient.

ROSES, WAR OF THE, a disastrous civil contest which desolated England during the 30 years from 1455 to 1485, sacrificing 80 princes of the blood, and the larger proportion of the ancient

nobility of the country. It was so called because the two factions into which the country was divided upheld the two several claims to the throne of the Houses of York and Lancaster, whose badges were the white and the red rose respectively. After the House of Lancaster had possessed the throne for three generations (see PLANTAGENET), Richard, Duke of York, whose title to the throne was superior to that of Henry VI., began to advance, at first somewhat covertly, his claim to the throne. In 1454, he was appointed Protector of the realm during Henry's illness, and on the king's recovery, he declined to give up his power, and levied an army to maintain it. For an account of the Wars of the Roses, see EDWARD IV., EDWARD V., RICHARD III., and HENRY VII. The accession of Henry VII. may be said to have terminated the Wars of the Roses, although the reign of Henry was from time to time disturbed by the pretensions of Yorkist impostors.

ROSE'UTTA, a city of Egypt, situated on the west bank of the old Bolbitic branch of the Nile, about 4 miles above the mouth, in 31° 25' N. lat., and 30° 28' 20" E. long. The name is supposed to be an old Egyptian one, and to have been derived from *Rusat*, or the mouth of the plains. Here was discovered the so-called Rosetta Stone, or trilingual inscription in the hieroglyphic, demotic or enchorial, and Greek language, which was the key to the interpretation of the hieroglyphs. It is of black basalt, about 3 feet 7 inches in length, and 2 feet 6 inches in width, containing about one-third of the hieroglyphic, and nearly all the Greek and Roman portions, the upper part and portion of the side having been broken away.

The contents of the inscription are a decree in honor of Ptolemy Epiphanes by the priests of Egypt assembled in a synod at Memphis, on account of his remission of arrears of taxes and dues owed by the sacerdotal body. It was set up 195 B.C., and is the only one of the numerous examples ordered to be placed which has been brought to light. This monument was discovered in 1799 by M. Boussard, a French officer of engineers during the French occupation of Egypt, in an excavation made at Fort St. Julien, near Rosetta. More recent excavations have shown that it was found on the site of a temple dedicated by the Necho II. of the 26th dynasty to the solar god Atum, or Tum. By the Arabs, R. is called Rashid. It first rose into importance when the accumulation of mud had silted up the Damietta branch, and destroyed the importance of that city. It has been much praised for its verdure and charming gardens, which present an agreeable contrast to the barren wastes by which it is surrounded. It contains a mixed population, reported by the census of 1881 at 16,671. The streets are narrow, running north and south. The river has a sandbar at the mouth, preventing the entrance of large ships-of-war. It was unsuccessfully attacked by the British in 1807.

ROSETTA WOOD is a furniture-wood of a lively orange-red color with very dark veins. It is imported from the East Indies in logs about a foot in diameter; but it is not known what tree produces it. It is little used, because, although extremely beautiful when first cut, the colors become dark by exposure.

ROSE QUARTZ, a variety of Quartz (q. v.), often crystallized in the form of Rock-crystal (q. v.), but also found massive or imperfectly crystallized. It differs from common quartz and rock-crystal chiefly in its color, which is of a delicate pink or flesh color, sometimes crimson or nearly so. The color is due to the presence of manganese. R. Q. is valued as an ornamental stone, the larger masses being made into vases, &c., the smaller pieces into jewels, seals, &c. A bright red kind is known as *Bohemian Ruby*, and is sometimes fraudulently sold as ruby.

ROSE-WATER. See PERFUMERY.

ROSE-WINDOW, a circular window with tracery.

RO'SEWOOD, a name given to the wood of a number of different trees, valued for beauty, and used for ornamental furniture.—The R. of commerce has been thought to be the produce of a species of *Mimosa*, a native of Brazil. It is also said that R. is the timber of several species of *Triptolomea* (natural order *Leguminosæ*, suborder *Papilionaceæ*); but the trees yielding R. are, in general, still doubtful to the botanist, although different kinds of R., imported from South America, are much used for veneering, in making furniture, musical instruments, &c. R. has for a long time been second only to mahogany as a furniture-wood in Europe. It has a dark blackish-brown color, beautifully marked with streaks of dark red, and when being sawn or cut, yields an agreeable smell of roses, from which it receives its name. We receive it chiefly from Para and Maranhão, in logs usually about ten feet in length; each log is only half the trunk, which is split in two to be sure it is sound. Violet wood and king wood are from similar trees.

The name R. has been also given to kinds of timber grown in Jamaica, in Africa, and in Burmah. One valuable kind of R. is yielded by an East Indian tree, *Dalbergia latifolia*, also called

Blackwood. It is found chiefly in Malabar, and grows to a height of about 50 feet. It is of the natural order *Leguminosæ*, suborder *Papilionaceæ*. The timber is very valuable. It is much used in Bombay for ornamental furniture. Planks of 4 feet in breadth are sometimes obtained, after the sapwood has been removed. The increasing value of the wood has led to the formation of new plantations, under the care of the government conservator of forests, in several parts of the Madras presidency.

ROSICRUCIANS, the name of a secret society of the 17th c., which is involved in much mystery, and the history of which has led to a great deal of discussion. The name is explained by Mosheim and others, as derived from *ros*, dew, and *cruz*, the cross. **CRUX** is supposed mystically to represent **LUX** or light, because the figure $\dagger$ exhibits the three letters LVX; and light, in the opinion of the Rosicrucians, is that which produces gold. Now dew (*ros*) is the greatest solvent of gold in the ancient science of alchemy. But without insisting on this very mysterious explanation of the name Rosicrucians, we must be content with an account of the association itself.

The beginning of the 17th c. was a period which manifested an extraordinary tendency to mysticism in science as well as in religion; alchemy, astrology, and divination divided the public interest with Pietism in the Protestant world, and the Convulsionist mania in the Catholic community. A remarkable impulse was given to this tendency by the simultaneous appearance of two anonymous books, printed at Cassel in 1614, in German, entitled *Universal and General Reformation of the whole wide World*; together with the *Fama Fraternitatis*, or *Brotherhood of the Illustrious Order of the R. C. (Rosy Cross)*; to the *Rulers, States, and learned of Europe*; printed at Cassel, by William Wessell. The first of these books is a kind of mystic allegory. In the reign of Justinian, Apollo, finding the world full of every kind of corruption, resolves on effecting a reformation; and with this view, calls up the seven wise men of Greece, and three Roman philosophers, of whom Cato and Seneca are the chief advisers. Their deliberation forms the subject of the book, which is a satire at once on the philosophy and the political systems and governments of the age. The *Fama Fraternitatis* is the story of a certain holy and reverend Brother Christian Rosenkreuz (i. e., Rosy Cross), who is represented as living in the 14th century. This Father, a German of noble birth, having been educated in a monastery, conceives a design for the reformation of the world; and after learning at Jerusalem and Damascus all the science of the Arabians, spends three years at Fez, in Morocco, in the study of the magical science of the Moors, and returns to Germany, where he establishes, in a house under the title Sancti Spiritus, with the aid of seven monks from the convent where he had been educated, a fraternity, which is the original brotherhood of the Rosy Cross.

These adepts having framed a system with secret symbols, and committed it to paper, sent forth Father Rosenkreuz to propagate the brotherhood, which was to be kept secret for 100 years, the members, however, meeting once each year in the mother-house of Sancti Spiritus. Rosenkreuz died at the age of 106, and the place of his burial was held secret by the adepts; but he ordered that an inscription should be placed on one of the doors of Sancti Spiritus: 'Post exx. annos patebo.' In the following year, 1615, a third tract appeared, also in German, entitled *Confessio, or Confession of the Society and Brotherhood R. C.*, which purports to be a defence of the brotherhood from the false rumors in circulation regarding it. The mixture of absurdity with seeming fanaticism displayed in these books has long proved a literary puzzle, of which not the least plausible solution is that which regards them as simply a serio-comic satire on the philosophical follies of the time, written by Johann Valentine Andrea, of Herenberg, as a mere exercise of humor, and without the intention or the expectation of their serious acceptance. Certain it is, that what whatever was the secret of the Rosicrucians, if there really was any, it has been well kept. They are not heard of for the rest of the 17th c., and their supposed connection with the Illuminati of Weishaupt, at the close of the 18th c., is more than doubtful. Equally doubtful is the theory of their connection with the Templars. From a book entitled *Curious Things of the Outside World: Last Fire* (Lond. 1861), it would appear that the Brethren of the Rosy Cross are not yet extinct. See Buhle, *Über Ursprung und Schicksale des Ordens der Rosenkreuzer* (Gött. 1803); Jennings's *Rosicrucians* (1870).

ROSIN, CHEMISTRY OF. See **RESINS**. When common Turpentine (q. v.), obtained from several species of Pine (q. v.) and Fir (q. v.), is distilled with water, it yields nearly one-fourth of its weight of essential oil, while the residue in the retort consists of common rosin, or colophony. There are two principal varieties of rosin, one of which is of a brown, and the other of a white color. The brown variety is furnished by the Norway Spruce Fir, and is an amber-colored brittle solid, consisting of two isomeric acids, the *sylic* and *pinic*, having the common formula,

$C_{10}H_{16}O_2$, HO. Pinic acid, which is the more abundant of the two, is soluble in cold alcohol, from which it is obtained on evaporation as an amorphous mass. When heated to partial decomposition, it yields another isomeric acid, the *colophonic*. The white variety of rosin, known commercially as *Galipot*, is obtained from the turpentine yielded by *Pinus maritima* (see PINE), and consists almost entirely of an acid, isomeric with the preceding, and termed the *pinaric*. On evaporating its alcoholic solution, the acid is obtained in a semi-crystalline form; and on melting the mass thus obtained, and allowing it to cool, the resulting product is a colorless glass as clear as crystal.

Common rosin dissolves freely in alkaline solutions, and enters largely into the formation of yellow soap. The alkaline resinsates are, in point of fact, true soaps, but are inferior in their cleansing properties to the stearates, oleates, and margarates. All the above described acids of rosin are monobasic, soluble in ether and hot alcohol, and insoluble in water.

ROSS, SIR JOHN, C.B., Arctic voyager, born June 24, 1777, at Balsarroch, Wigtonshire, was a son of the Rev. Andrew Ross of Inch. He entered the navy at the early age of 10, was 15 years a midshipman, 7 years a lieutenant, 7 years a commander, and became a post-captain in 1818. When Lieutenant of the *Surinam* he was wounded in cutting out a Spanish vessel from under the batteries of Bilbao, in 1806. During the war he was in three different actions. His more important services were rendered in the Arctic regions, whither, in 1818, he proceeded with Sir W. E. Parry. See **NORTH-WEST PASSAGE**. He published the results of his investigations in 1819. In May 1829, he was employed on a fresh expedition to the Arctic regions (fitted out at his own expense by Sir Felix Booth), and discovered the peninsula of 'Boothia Felix.' R. received, on his return, the honor of knighthood, and was made C.B. He received the freedom of London and other cities, gold medals from the Geographical Societies of London and Paris, was made a knight of various foreign orders, and received other acknowledgments of his services. In 1838, he was appointed British consul at Stockholm, where he remained some years. He was author of *Letters to Young Sea-officers; Residence in Arctic Regions*, &c. (1829–1834); 4to; Appendix to same, 4to; *Memoirs and Correspondence of Admiral Lord de Saumarez*, 2 vols. 8vo; *Treatise on Navigation by Steam*, 4to. He became a rear-admiral in 1851, and died August 30, 1856, at his house in Gillingham Street, Finsbury.

ROSS, SIR JAMES CLARK, Arctic explorer (nephew of the preceding), third son of George Ross, Esq., of Balsarroch, Wigtonshire, was born in London, April 15, 1800. He entered the navy in his 12th year, and served under his uncle in the Baltic, the White Sea, the coast of Scotland, and in all the naval expeditions for the discovery of the North-west Passage (q. v.) from 1818 to 1833. It was while accompanying his uncle in his second Arctic voyage that he discovered, 1831, the North magnetic pole, and on his return he was rewarded with a post-captaincy. Afterwards employed by the Admiralty in a magnetic survey of Great Britain and Ireland, he, in 1836, crossed the Atlantic to relieve the frozen whalers in Baffin's Bay; and in 1839 he was placed in command of an expedition to the Antarctic seas (see **POLAR EXPEDITIONS**), and approached within 160 miles of the South magnetic pole. On his return in 1843, he received the honor of knighthood; and in 1847 he published his *Voyage of Discovery in Southern Seas, 1839–1843*. In January 1848, he made a voyage in the *Enterprise* to Baffin's Bay, in search of Sir John Franklin, but without success. He received the 'Founder's gold medal' from the Geographical Society of London in 1841, the gold medal of the Paris Society, and D.C.L. from Oxford in 1844. He died in 1862.

ROSS, a Celtic word, meaning a headland, occurring as the name or part of the name of many places in the British Islands, and in other parts of Europe, as Roslin, Culross, Rossberg, Ross (in England), Montrose, Roxburgh, Ardrossan. There is another Welsh root, *rhos*, signifying a moor, which is found in Welsh and Cornish names, as Rossall, Rusholme. In Roseness, in Orkney, the equivalent Teutonic term *ness* has been superadded after the meaning of the Celtic *ross* had been lost.

ROSS, a thriving market-town in Herefordshire, is finely situated on the left bank of the Wye, 14 miles south-south-east of Hereford. In the parish church (dare 1816) is buried John Kyrle, celebrated by Pope as the 'Man of Ross' (q. v.). The town is well furnished with schools, carries on a trade in cider, malt, and wool; is much visited by tourists, and contained (1881) 3724 inhabitants.

ROSS AND CROMARTY, treated of in the 'Census of Scotland —1871,' as one Scottish county, is, as such, bounded on the N. by Sutherlandshire, E. by the German Ocean, S. by Invernessshire, and W. by the Atlantic. Ross comprises the districts of Easter and Wester Ross, Ardmeanach, or the Black Isle, and the island of Lewis (q. v.). R. and C., in many parts, present a wild and

mountainous aspect, intersected by beautiful glens, valleys, lakes, and rivers. Many of the mountains are of considerable altitude, the highest ranging from 3000 to 4000 feet, the most remarkable of which is Ben Wyvis. The high grounds afford excellent pasture for sheep and cattle, and the glens and low grounds, in the more favored portions, are generally of a superior soil, which, with the fine climate, especially in Easter Ross, produce grain of a superior quality. There are numerous fresh water lakes and rivers.

The principal loch is Maree (q. v.). There are several other lakes of considerable size, which altogether occupy an area of 90 sq. miles. There are numerous water-courses, the chief of which are the rivers Oikel and Conon, and several high waterfalls, the principal being Glomach, one of the finest in the kingdom. Limestone and ironstone are to be met with in abundance, as also granite and mica slate; and there are various mineral springs of note, the most famous of which is that of Strathpeffer. About the beginning of last century, the country in many places was nearly devoid of trees, but soon after, numerous plantations were formed, and many parts are now occupied by extensive forests. The lakes, rivers, and coast abound with fish, and the bays and sea-lochs being numerous, the fisheries are carried on extensively, occupying upwards of 22,000 persons.

According to the census of 1871, the area of the two counties is 3151 square miles, or 2,016,375 statute acres. The valued rental in 1674 was £7000; the valuation of 1880—1881 (exclusive of railways) was £288,730. The total acreage under all kinds of crops, bare fallow, and grass, in 1880 was 131,558; under corn crops, 48,470; under green crops, 27,540; clover, sainfoin, and grasses under rotation, 86,763; the permanent pasture, exclusive of heath and mountain-land, was 17,836. The number of horses used for agricultural purposes was, in the same year, 7490; the cattle counted 42,735; the sheep, 861,236; and the pigs, 5631.

The population of the united shires in 1871 was 80,955; (1881) 78,547. The joint parliamentary constituency, which returns one member to parliament, is 1739 in number. The chief towns are Dingwall (q. v.), Fortrose (q. v.), and Tain (q. v.).

ROSS, THE MAN OF, a name given by Pope to John Kyrle, an English gentleman of great benevolence, who was born at Whitehouse, Gloucestershire, in the first half of the 17th century. Kyrle received his appellation from having resided during the greater part of his life in the small town of Ross, Herefordshire. He there spent his time and fortune in building churches and hospitals, which procured for him the love and veneration of his contemporaries. Kyrle may be considered the Howard of his age; and Wharton in his *Essay on the Writings and Genius of Pope*, has stated that he deserved to be celebrated beyond any of the heroes of Pindar.

Pope, during his visits at the old mansion of Holm Lacy, the seat of Viscount Scudamore, near Ross, heard so much of Kyrle's beneficence, that in his *Moral Essays* he celebrates his praises under the name of the Man of Ross:

'Behold the market-place with poor o'erspread
The man of Ross divides the weekly bread:
He feeds yon almshouse, neat, but void of state,
Where age and want sit smiling at the gate:
Him portioned maids, apprenticed orphans blessed,
The young who labor, and the old who rest.'

We learn further, from the same poem, that the fortune of Kyrle was no more than £500 a year. Kyrle died in 1724, and was buried in the church of Ross.

ROSSA'NO, a city of Southern Italy, in the province of Cosenza, is situated at the foot of the Apennines, 2 miles from the Gulf of Taranto, on a high rocky hill, surrounded by steep precipices. It is walled and well-built, is defended by a castle, and contains a beautiful cathedral, inlaid with carved marbles. Its fields are very fertile, producing grapes and lemons. R. was laid waste by Totila, king of the Goths. Pop. (1872) 14,818.

ROSSBACH, a village in Prussian Saxony, in the government of Merseburg, and 8 miles south-west of the city of that name, is celebrated in history for the victory here gained by the Prussians under Frederick the Great over the combined French and Imperialist armies on 5th November 1757. A short time previously, Frederick had been compelled to leave the bulk of his army in Silesia under the Duke of Brunswick-Bevern to check the Austrians on this side, and hastened with 22,000 men to oppose the invasion from the west. The Prince of Soubise (one of the 'amateurs' French generals of the period), who was at the head of the confederate army of 60,000 men, thinking from Frederick's cautious manoeuvres that he was terrified and desirous of retreating, at once charged forward with his cavalry, and left his columns at the mercy of General Seidlitz, who attacked them in front and flank with the whole of the Prussian cavalry and artillery. The confederates were speedily thrown into utter disorder, and, being charged in front by the Prussian infantry under Prince Henry, their rout was complete. The 'rout of Rossbach' was so utterly disgraceful that it remained for a long time proverbial in the

French army. The Prussians lost (according to a French account) only 300 men, while the loss of the allies was more than 1200 slain, 6000 prisoners, among whom were 11 generals and 800 officers, and 72 cannon, with many other trophies.

ROSSE, WILLIAM PARSONS, third EARL OF, a well-known practical astronomer, was born in York in 1800, and educated first at Trinity College, Dublin, and afterwards at Magdalen College, Oxford, where he graduated first-class in Mathematics in 1822. During the life of his father, he sat in the House of Commons as Lord Oxmantown, representing King's County from 1821 to 1831; he succeeded to the peerage in 1841, and was elected a representative peer for Ireland in 1845. At an early age R. had devoted much attention to the study of practical science, and especially to the improvement of the telescope, and had commenced as far back as 1826 to make experiments in the construction of fluid lenses (see *Philosophical Transactions* for 1840), but he subsequently relinquished those investigations, to engage himself with the problem of the best mode of constructing the speculum of the reflecting telescope. The two great defects which had hitherto baffled opticians were 'spherical aberration' and absorption of light by specula; and in the casting of these of large size, there was the apparent impossibility of preventing cracking and warping of the surface on cooling. However, by a long series of carefully conducted experiments, he succeeded in discovering a mode of operation by which the last defect was wholly obviated, and the two others greatly diminished in amount.

The metal for the speculum of his great telescope (see TELESCOPE), three tons' weight, was poured into the iron mould April 1842, the crucibles being lifted and emptied by means of cranes; and the mould was kept in an annealing oven for 16 weeks, so that the metal should cool equably. It was then polished and mounted in his park at Parsonstown, at a cost of £80,000, the adjustments consisting of a system of chains, pulleys, and counterpoising weights, so complete in all its parts, that the ponderous instrument of 12 tons' weight can be moved so as to point in any direction, and with almost as much precision as the ordinary equatorial of the observatory. The first addition to the body of astronomical knowledge made by this telescope was the resolution of certain nebulae, which had defied Herschel's instrument, into groups of stars; next came the discovery of numerous binary and trinary stars, and a description of the moon's surface. This telescope, constructed under R.'s personal directions, is described in the *Philosophical Transactions*. He died in 1867, and a statue to his memory was erected in Parsonstown in 1876.

ROSSETTI, GABRIELE, a celebrated Italian author, was born at Vasto in 1783, and came to England as a political refugee in 1824. Two years afterwards he published the *Comento Analitico* on the *Divina Commedia* of Dante, in which he aimed to show that in the middle ages all the poets used a jargon under which they veiled their hatred of the papacy, and concealed the true religion under the form of a woman beloved by them. In conducting this argument he displayed amazing erudition. His opinions naturally excited a great deal of hostile criticism. R. replied to his opponents with the work, *Sullo Spirito Antipapale che produsse la Riforma, e sulla influenza che esercitò nella letteratura di tutta l'Europa e principalmente d'Italia* (1830). But this book did not convince them either, and then R. sought to reduce to method his system, and published *Il Mistero dell'Amor Platonico svelato* (1840), and *La Beatrice Di Dante*. Whatever may be thought of R., he has at least founded a new school of interpretation of Dante, and his partisans are numerous in Italy. His name is well known in the peninsula for his national poems, which have gained for him the title of the Italian Tyrtæus. These are contained in the *Diò e l'Uomo* (1840); *Il Veggente in Solitudine* (1846); *L'Arpa Evangelica* (1852); *Poesie di Gabriele Rossetti* (1847). He was Professor of Italian Literature in King's College, London, and was honored and esteemed by many of the most eminent public men in England. He died in London in 1854.

ROSSETTI, DANTE GABRIELE, son of the former, distinguished as a thoughtful and powerful painter, a graceful poet, and an elegant translator of early Italian poetry, was born in London in 1828, and educated at King's College, London. As a painter, he was more talked of than known, probably because his works were transferred into private collections as soon as they left his studio, and without undergoing the publicity of exhibition. Although he never exhibited at the 'Royal Academy,' his pictures were occasionally sent by their proprietors to various public picture-galleries. Of these, his 'Fair Rosamond,' a picture pervaded by earnest thought, and treated in a powerful, though strikingly unconventional manner, was exhibited in the galleries of the Royal Scottish Academy in 1860—1861. Of his other pictures, the chief are 'Ecce Anella Domini,' and 'Beatrice Dead.' He contributed some fine drawings to an illustrated edition of Tennyson, which, although inadequately engraved, rank among the first of modern woodcuts. These, like everything this artist has produced, are strongly imbued with the spirit

of the Romantic period. R.'s name was first brought prominently forward by his association with Millais and Holman Hunt in the 'Pre-Raphaelite Brotherhood.' While time and experience modified the practice of some of the original pre-Raphaelites, R.'s pictures displayed to the last the peculiarities of earlier days. As an author, R. is well known by his translations of the *Early Italian Poets from Ciuolo d'Alcamo to Dante Alighieri* (1100—1200—1300) (1861). In conjunction with his brother WILLIAM, he edited Gilchrist's *Life of William Blake, Pietor Ignotus* (Lond. 1863), left incomplete at the death of the compiler. *Poems* (1870), new edition, with additions (1881), added to R.'s reputation. His *Ballads and Sonnets* (1881) confirmed and extended this reputation, and were received by the critics with almost unanimous applause. He died April 10, 1882. See Caine's *Recollections of Rossetti* (1882).

R. is not only a painter and author, but a man of thorough acquaintance with and high accomplishment in applied and decorative art. He has borne a distinguished part in the resuscitation of Gothic art in England, both ecclesiastical and domestic.

CHRISTINA R., sister of the above, and born 1830, has made a literary reputation by her *Goblin Market* (1862), *The Prince's Progress* (1866); *Speaking Likenesses* (1874), and *A Pageant* (1881), &c.—WILLIAM M. R. has earned a name as an accomplished critical writer from his translation of Dante's *Hell* (1861); *Criticism on the Poems and Ballads of Swinburne* (1866), &c. In 1850, he was editor of *The Germ*, the organ of the Pre-Raphaelites, devoted to the inculcation of their fundamental principle, which was direct study from nature herself, unfettered by the conventionalities of the 'antique' and 'academies.'—Another sister, MARIA (born 1827, died 1876), was known as the author of an able study of Dante.

ROSSI, PELLEGRINO, was born of a noble family at Carrara in 1787. He carried on his studies at the university of Bologna. In 1812, being 25 years of age, he was appointed Professor of Law in that university. In 1815, King Murat having proclaimed Italian independence, R. sided with him. On the fall of Murat, R. was exiled. He took refuge at Geneva, where he was appointed Professor of the Science of Law. There he published *Le Droit Pénal*, a very learned work, which made him famous in France. In 1833, Louis-Philippe called him to Paris, and appointed him Professor of Political Economy. Then R. commenced the course *Du Droit Constitutionnel*, and the government, in order to reward the great publicist, naturalized him and made him a member of the Chamber of Peers. Protected by Guizot, the prime minister, R. was sent to Rome as ambassador in 1845. There he witnessed all the events of 1848 and took part in them, having again become an Italian subject after the fall of Louis-Philippe. When called to the ministry by Pius IX., R. wished to oppose the party favorable to the House of Savoy, and devised an alliance with the king of Naples, which had for its object a confederation of Italian princes with the popes their president. This roused the hatred of the Romans, and R. was stabbed by an unknown hand on the 15th November 1848. In 1860, Luigi Carlo Farini decreed the publication of all the writings of R., and that a bust of him should be given to the university of Bologna, where it was inaugurated with great solemnity on the 27th April 1862.—Besides *Le Droit Pénal*, R. published the *Cours d'Economie Politique* (1840); the *Lettres d'un Dilettante Politique sull'Allemagna, sulla Francia, e sull'Italia* (Florence, 1848); and left many inedited writings, which, after his death, were published in Paris at the expense of the Italian government.

ROSSIE'NY, a town of European Russia, in the government of Kovno, 66 miles north-west from Kovno on the Dubitzka, a branch of the Niemen. Under the Polish government, it was the capital of Samogitia. Pop. (1867) 10,732.

ROSSINI, GIOACCHINO, the greatest composer of the present century for the Italian lyrical stage. He was born at Pesaro in 1792, the son of a horn-player in an orchestra of strolling players. At the age of fifteen, the Countess Perticari, discovering his talent, sent him to study at the lyceum of Bologna, where he received instructions in counterpoint from Padre Mattei. He was, however, principally self-taught, giving days and nights to the study of the great Italian and German masters. Passing over a few juvenile efforts, his first important opera was *Tancredi*, which was first performed in Venice in 1813, and excited an extraordinary sensation throughout the musical world, raising its composer at once to the summit of fame. It was followed in succession by *L'Italiana in Algeri* (1813), *Il Turco in Italia* (1814), and *Aureliano in Palmira* (1814), all inferior to *Tancredi*. In 1815, R. was appointed musical-director of the theater of San Carlo at Naples; and while holding that position he continued to produce operas both at Naples and elsewhere. *Il Barbiere di Siviglia*, the most popular of all his works, was produced at Rome in 1816, and said to have been composed in twenty days; it was followed by *Otello* in the same year; and in 1817, appeared *La Cenerentola* at Rome, and *La Gazza ladra* at Naples. From this time to the close of

R.'s engagement at Naples in 1823, he wrote the operas of *Mosè in Egitto*, *La Donna del Lago*, *Maometto Secondo* (otherwise known as *L'Assedio di Corinto*) and *Zelmira*. In 1823, he produced *Semiramide*, the most gorgeous of his operas, at Venice, and soon afterwards left Italy. He visited first Paris, and then London, where he was received with great enthusiasm.

Returning to Paris, he received from Charles X. the appointment of director of the Italian Opera in Paris, and while there composed his *Guillaume Tell* (1829), which, though ill-constructed as a drama, ranks musically as high as any of his works. When the revolution of 1830 broke out, R. lost the management of the Italian Opera, but continued to live for some time in Paris; in 1836, he returned to Italy, where, with the exception of a visit to Paris, he principally resided till 1855. With *Guillaume Tell* he may almost be said to have closed his career, having after it composed nothing of importance except his well-known *Stabat Mater*, a pretty and popular work more secular than sacred in its style of music. Large offers from the managers of opera-houses did not succeed in tempting him from his retirement. His statue was inaugurated at Pesaro in 1864, amid a large concourse of Italian statesmen and men of letters. In R.'s early works he developed with great felicity the type established by his Italian predecessors. These compositions are characterized by stirring melody, brilliant instrumentation, and a highly enjoyable vivacity. *Guillaume Tell*, though equally original, approaches far more nearly to the character of the German school. Much as R.'s music continues to be prized, only four of his forty operas, composed from 1810 to 1829, have kept the stage, *Il Barbiere*, *Otello*, *La Gazza ladra*, and *Semiramide*. He died November 1868.

ROSSO ANTICO, the technical name for the red porphyry of Egypt. It consists of a red felspathic base, in which are disseminated rose-colored crystals of oligoclase with some plates of hornblende, and grains of oxidized iron ore.

RO'STER (corrupted from Register) is a fixed order preserved in military departments as the rotation in which individuals, companies, or larger bodies are called on to serve. Regiments proceed on foreign service according to the roster.

RO'STOCK, the most important town and seaport of the grand duchy of Mecklenburg-Schwerin, stands in a flat fruitful district on the Warnow, 9 miles from the mouth of that river in the Baltic, and 55 miles north-east of Schwerin by railway. It is surrounded by ramparts and walls pierced by 12 gates, and has still a mediæval aspect. The university, founded in 1419, maintains 39 professors and lecturers, and has a library of 120,000 volumes. The handsome new university building is a Renaissance structure in brick. In St. Mary's Church, a large building dating from the 13th c., and possessing one of the finest organs in Germany, is the tomb of Grotius. St. Peter's, dating from the 12th c., has a tower 420 feet high. There are several squares, of which Blücher's Square contains a colossal monument of the general of that name. Manufactures of linen and tobacco, and tanning, brewing, and distilling are carried on. In the year 1866, the town of R. owned 377 vessels. The exports are chiefly wheat, barley, oil-cakes, and cattle-bones to Great Britain. The imports are coals, salt, iron, limestone, herrings and other provisions, timber, &c. At the mouth of the Warnow is Warnemünde, the port of R., at which all vessels drawing more than 10 feet load and unload. Pop. of R. (1890) 36,967.—R. is of Slavic origin, and a shadowy glimpse of it is got in the 11th or 12th c., but the progress of commerce and other causes, chiefly political, rapidly Germanized it, and in 1218 it figures as wholly German. It was a member for centuries of the old Hanseatic League, long ranked in importance with Lübeck, and still enjoys to a wonderful extent its ancient privileges—the municipal constitution of the town being even yet almost republican.

ROSTOF, a town of European Russia, and one of the most ancient in the empire, in the government of Jaroslavl, stands on the banks of Lake Nero or Rostofsky. An important fair is held here, and a flourishing commerce, which the railway from Jaroslavl to Moscow promises to increase, is carried on. R. contains numerous factories, the chief manufacture being that of linen. Pop. (1880) 10,000.

ROSTOF ON THE DON, a district town and ferry of South Russia, in the gov. of Ekaterinoslav, stands high on the right bank, and at the head of the delta, of the Don. It owes its origin to the foundation of the fortress of St. Dmitri here in 1749, since which time the progress of the town, owing to its advantageous situation, has been so great that it is now the center of trade in South Russia. Its custom-house was erected in 1835, and in that year the customs' dues amounted to £150,000. The annual exports have amounted to £1,198,526, the principal articles being wheat, iron, tallow, and linseed. Manufactures are carried on with activity in 22 factories, the principal articles produced being cast-iron, bricks, ropes, tobacco, macaroni, soap, and leather. Railway communication with Vladikaukas in Caucasia was opened in 1875. Pop. (1880) 44,500.

ROSTOPCHINE, FEODOR VASSILEVITCH, COUNT, a Russian general, directly descended from Genghis Khan, was born in the province of Orel, March 23, 1765; and, after having filled for some time the office of page to Catharine II., entered the Russian military service as a lieutenant in the Imperial Guard. In 1784 he set out on a course of foreign travel, returning to St. Petersburg in 1792, and obtaining through the powerful influence of some friends, the post of gentleman-of-the-chamber. Having the good fortune to be the first messenger to Paul of his accession to the throne, he was immediately (1796) created general, a rise in rank speedily followed by the successive appointments of grand-marshal of the court, minister of foreign affairs, count (1799), and chevalier of all the Russian orders. R. possessed extraordinary influence over the mind of the half-witted monarch, and succeeded in preventing his vagaries from seriously affecting the government or religion of the empire; but he was repeatedly banished from court and almost immediately recalled, and it was during the last of these banishments (to Moscow) that the czar was murdered. The Emperor Alexander seems to have disliked him, for R. remained in a state of banishment till May 1812, when, having need of the services of all his subjects, and knowing R.'s distinguished patriotism, Alexander appointed him governor of Moscow. On the approach of the French, R., by extraordinary exertions, raised an army of 122,000 men fully equipped, but to his great chagrin was ordered to evacuate Moscow.

R. has been unanimously branded by the French writers as the burner of Moscow, and for a long time this was generally credited in the west, till, in 1823, he published in his own defence, *La Vérité sur l'Incendie de Moscou* (Paris, 1823), in which he rebuts the charge, affirming that this barbarous action was due in part to the fervid patriotism of a few of the inhabitants, and in part to the violence and negligence of the French. At the same time, he showed that the damage done to Moscow was much less than the estimate given by French and English writers, and that the Kremlin, which the French had attempted to blow up, had been in reality little injured. R. certainly set fire to his own mansion-house in the neighborhood, but no other act of incendiarism has been proved against him, the accusations published in the *British Monitor* (1823) having been triumphantly rebutted. He had succeeded in repairing much of the damage done to the city, and in recollecting many of its former inhabitants, when, through a court intrigue, his dismissal from office was effected (August 30, 1814). R. accompanied the Emperor Alexander to the Congress of Vienna, and subsequently (1817) retired to Paris, where he occupied himself in literary pursuits, and in forming a fine collection of pictures and books. In 1825, he returned to Russia, and died January 30, 1826, at Moscow. His wife and one of his sons have made for themselves names in literature, and his daughter-in-law, the Countess EUDOXIA ROSTOPCHINE, is considered as one of the first poets of Russia. R.'s works, which include a number of historical memoirs, comedies, &c., in Russian and French, were collected and published at St. Petersburg in 1858.

ROT is known in the south-western counties of England under the provincial names of bane, coa, or cothe. It consists in the maturation within the liver and biliary ducts of an entozoon, the *Distoma hepaticum*, or Fluke (q. v.). Although most frequent amongst sheep, it also occasionally attacks rabbits, hares, deer, and cattle. Until of late years, the annual losses amongst the flocks of Great Britain were estimated at a million; but in 1809, 1824, 1830, and 1833, this large mortality is believed to have been doubled. During the wet winter of 1852—1853, and again in the autumn of 1860, and early months of 1861, rot was extensively prevalent. Autumn and early winter are the periods of its most frequent occurrence. Close damp weather, inducing a rapid growth of soft, luxuriant herbage, favors its development. The rising of the Nile is said to rot annually 16,000 sheep. Low, damp, marshy situations, water-meadows, undrained lands, especially when of a clayey, retentive consistence, furnish a large proportion of cases. The hay from such localities induces rot almost as readily as the fresh grass. Sheep grazed even for a few hours upon land subject to rot, or taking a single draught from an infected stagnant pool, may contract the disorder, most probably by swallowing the young flukes. From 15 to 40 days usually elapse before any serious consequences follow from the presence of the parasite. At first, indeed, digestion appears to be stimulated, and the sheep thrive rather better than before; but by and by they rapidly waste, their wool becomes dry, and easily detached, their bowels irregular, their skin and mucous membranes yellow, as is usually conveniently observed by examining the eye and its pearly coruncle, which in rot loses the brilliancy of health, and exhibits a dingy yellow hue.

The body, after death, is soft, flaccid, and indifferently nourished; watery effusions are discovered underneath the jaws and in other dependent parts; the small quantities of unabsorbed fat have a dirty yellow color; the liver is soft and enlarged, and

usually mottled with patches of congestion. In the thick and muddy bile, the flukes, with their myriads of spawn, float in variable numbers.

The treatment of rot is seldom very satisfactory; and if the animals, when first affected, are in tolerable condition, no time should be lost in having them slaughtered. If remedial measures are attempted, the sheep should be removed to a dry and sound situation, and liberally supplied with dry nutritive food. During the summer, allow corn or cake with the grass; during the winter, when cases are most frequent, supply clover-hay, pease, or split beans, a little bruised linseed cake, and a few roots: pieces of rock-salt should also be laid about the ground, for the patients to lick at. Medicines are seldom of much avail. Those most to be relied on are turpentine and powdered gentian in two-drachm doses, given daily, beat up with an egg and a little milk, or with some linseed gruel. The turpentine, besides acting beneficially as a stimulant, doubtless also exercises a poisonous action on the flukes, whilst the gentian imparts tone to the irritable and relaxed bowels. The prevention of rot is usually effected by removing from the land all superfluous moisture by deep and thorough drainage.

The improvement of unsound herbage may subsequently be expedited by dressings of lime, salt, soil, or composts of farm-yard manure and earth. On all suspicious grazings, beans and oats should for a time be given in moderate quantity, and access allowed to rock-salt. The Arab and Bedouin shepherds have for centuries recognized the importance of such measures, for, when their flocks become rotten from depasturing on the rank herbage that shoots up after the risings of the Nile, they often prevent serious loss by promptly transferring them to the desert, where the dry forage-plants are very rich in saline matters. The Australian flock-master likewise checks the complaint by promptly removing his sheep, which have become tainted, from the deep, alluvial soils to the poorer upland 'salt-brash' countries. In like manner, the salt marshes of Cheshire, and the saltings left along our coasts by the tides, have long enjoyed a well-deserved celebrity in the prevention, and even in early cases, in the cure of sheep-rot.

RO'TA, a town of Spain, in the province of Cadiz, and six miles north-north-west from Cadiz, on the opposite side of the entrance of Cadiz Bay. Rota wine has acquired some celebrity, and is brought to the British market. Pop. 8000.

ROTANG. See **RATTAN**.

ROTA'TION (Lat. *rota*). There is, perhaps, no elementary idea which has been the subject of so much popular misconception as that of rotation. This is probably due to the vagueness of the definitions commonly given.

All motion that we can observe is *relative*; for instance, any fixed object on the earth's surface has a certain motion *relative* to the earth's axis, in consequence of the diurnal rotation; the earth itself has a certain motion *relative* to the sun, in consequence of its annual revolution; the sun has a certain motion *relative* to the so-called fixed stars; and it is possible that the whole stellar system may have a motion *relative* to something in space beyond its boundaries. Now, the motion of an object on the earth's surface differs according to the way it is measured: a passenger sitting in a railway-carriage is *at rest* if his motion *relative* to the carriage be considered; he has the same motion as the carriage, if it be measured *relative* to the rails; and if the carriage were running from east to west along a parallel of latitude, so as to complete the circuit in 24 hours, he would be at rest *relative* to the earth's axis. If, therefore, we wish to talk of *absolute* motion, it must be measured *relative* to **FIXED** points or directions; and in the violation of this obvious condition lies the error most commonly met with. Thus, to show that the earth rotates about its axis, we may observe its motion *relative* to the line joining it with the moon; and we observe that the moon comes to the meridian at intervals of (roughly) 25 hours. Does the earth rotate in 25 hours? We know that it does not, and the error consists in treating as an *absolute* rotation, a rotation measured *relative* to a line—that joining the earth and moon—which is itself turning. If we take the intervals of the sun's crossing the meridian, we find 24 hours—a much closer approximation; but still not exact, because our line of reference—that joining the earth and sun—is slowly turning.

Would we have an *absolute* measure, we must choose a *fixed* line, or one so nearly fixed, that its motion is absolutely insensible. Such is the line joining any fixed star with the earth, and the time of the earth's *absolute* rotation about its axis is 23^h 56^m 48.09—the interval between culminations of the same fixed star. The difference between *absolute* and *relative* rotation in any planet gives rise to the difference between the *sidereal* and the *solar* day; and the planet's year contains just *one* more of the former than of the latter.

Now, suppose for a moment that the earth were to revolve only $\frac{1}{11}$ th part as fast as it now does, there would be *one sidereal* day in the year, and there would be *no* solar day at all—in other

words, there would be *no* rotation of the earth with reference to the line joining it with the sun; that is, the earth would turn always the same side to the sun; yet it would be *absolutely* rotating about its axis once in a year. This is the case which we observe in the moon's motion relative to the earth, and we see at once that the moon must rotate *absolutely*—that is, with reference to fixed directions in space—in the exact time, in which she completes one revolution about the earth. Those who say the moon does not rotate on her axis, make precisely the same mistake as those who fancied that the earth is immovable, and that moon, sun, and stars revolve about it every day. There is a physical cause for this peculiarity in the moon's motion, which leads to very important consequences with reference to the future of the solar system. See TIDES.

Several elementary theorems regarding rotation may now be enunciated; but the proofs, though very simple, will be given merely in outline. Any displacement *whatever* given to a plane figure in its own plane—as to a sheet of paper lying on a table—is equivalent to a single rotation about a definite axis. Let A, B be any two points of the figure, and let them be displaced to A', B' respectively. Join AA', BB' , and bisect them in a and b by perpendiculars meeting in O . Then, it is easy to show that (1.) $OA' = OA, OB' = OB$, and therefore O is the *same* point of the

plane figure in its first and second positions. (2.) $\angle AOA' = \angle BOB'$, and is therefore the angle through which the whole has turned about the point O . If AA' and BB' are parallel, this construction fails; but in this case, if AB and $A'B'$ do *not* intersect, the motion is simply one of translation; if they *do* intersect, the point of intersection is the axis.

Any number of successive rotations about different points constitute, of course, a displacement, and are therefore reducible to one rotation.

Two equal and opposite rotations about different points give rise to a mere translation.

The first two of these propositions are true of figures on a sphere as well as on a plane surface; for the figure above has only to be drawn with great circles instead of straight lines, and the proof applies letter for letter. Only, here, the first case of exception cannot occur, because two great circles *must* intersect. Hence it follows, that if the center of a sphere be fixed, any displacement whatever is equivalent to a rotation about some axis; that is, after any motion whatever of a rigid body, one point of which is fixed, there is always *one* line of particles which remains undisturbed.

[This simple proposition has been found very hard to believe, even by men of considerable intelligence.] Hence rotations about any number of axes passing through the same fixed point may be compounded into one; and, generally, any motion whatever of a rigid body may be decomposed into two, one of which is a motion of translation of some chosen point, and the other rotation about some axis through that point. Thus, in the case of the moon, we have a motion of translation of its center in its orbit, and one of rotation about its axis; or we may combine them into a single rotation in the period of a lunar month about a fixed axis passing through the earth's center.

Again, any displacement of a plane figure in its plane, or of a spherical figure on a sphere, may be produced by the rolling of a curve fixed in the figure upon another fixed on the plane or sphere. Hence, the most general motion of a body with reference to one point, consists in the rolling of a cone fixed in the body upon another fixed in space, their vertices being at the chosen point. To this, when the cones in question are right circular cones, belong the *Precession* (q. v.) and *Nutation* (q. v.) of the earth and of a top, the evolutions of an ill-thrown quoit, &c.

ROTATION, MAGNETISM OF. This was discovered by Arago in the years 1824–1825. He observed that when a magnetic needle was made to oscillate immediately above a copper plate, it came sooner to rest than it did otherwise. The oscillations were made in the same time as when away from the plate, but they were less in extent; the plate seemed thus to act as a damper to the motions of the needle. This being the action of the plate at rest on the needle in motion, Arago reasoned that the needle at rest would be influenced by the plate in motion. Experiment confirmed his opinion. He made a copper disc revolve

with great rapidity under a needle, resting on a bladder placed immediately above it, and quite unconnected with it, the middle of the needle being placed above the center of the disc. As expected, the needle deflected in the direction of the motion of the disc. The deflection of the needle increased with the rapidity of the motion, and when it reached a sufficient amount, the needle no longer remained in a fixed position, but turned round after the disc. This action of the revolving disc was attributed to what was then called the 'Magnetism of Rotation,' and the name has been since retained.

The explanation of this phenomenon was first made by Faraday (1832). He found it to arise from the reaction of currents, induced in the plate in motion by the magnet. The accompanying figure illustrates the electrical condition of the plate. PP is the plate, rotating in the direction indicated by the arrow; NS , is the needle; and the lines with the arrow-heads indicate the general direction of the currents induced by rotation under the magnet in the plate. There are two complete circuits on each side of the disc, coinciding in the middle, and taking the direction CC . It is the conjoined current which affects the needle; it runs in a direction a little in advance of the needle, as the inductive power of the magnet takes

Fig. 1.

some time to act. As the induced current lies below the needle, the deflection (according to Ampere's rule, see GALVANISM) takes place in the direction of the motion of the disc. When cuts are made in the disc in the line of the radii, it loses almost entirely its disturbing power; the currents formed in the whole disc can no longer take place, and those formed in the various sectors are weak in comparison; by filling up the vacant spaces with solder, the power is nearly restored to it. As is to be expected, the effect of the revolving plate depends on the conducting power of the material of which it is made. It is owing to its high conducting power that copper is so much used in these experiments; hence, also, it is that copper should be so much used in the construction of magnetic apparatus. A copper compass-box, for instance, is not only desirable, from its being free from iron, but it acts as a damper to bring the needle quickly to rest when disturbed.

The magnetism of rotation is only one of a large class of phenomena, in which the motion, either of a magnet or of a conductor near it, induces an electric current in the conductor. We may here quote two experiments, which may be looked upon as the converse of the magnetism of rotation. In the first experiment, a small cube of copper (fig. 2) is hung by a thread to a frame, and placed between the poles of a powerful electro-magnet; the cube is sent into rapid rotation by the twist on the thread, previously

Fig. 2.

Fig. 3.

given it; it is instantly brought to a halt, when the current is allowed to circulate in the coils of the magnet, and it begins its motion again when the current is turned off. In the second experiment, a disc of copper, c , is made to rotate rapidly between the poles, n, s , of an electro-magnet, by means of a handle and intervening wheel-works, turned by the experimenter. When the current invests the soft iron poles with magnetism, the disc, moving freely before, appears suddenly to meet with an unseen resistance, and the rotation continues slowly or not at all. If persisted in, the rotation causes the disc to rise in temperature, the

rise being proportionate, according to Foucault, to the square of the velocity of rotation. These, and all similar phenomena, illustrate a law that holds universally in magnetic induction, and was first enunciated by Lenz. *When a current is induced by the motion of a magnet or conductor, the inductive action tends to develop in the conductor a current, in such a direction that its action will be to oppose the motion producing it.* Thus, in the last experiment, the part of the disc approaching the poles, has a current developed in it which repels them, and the part leaving the poles, has a current induced in it which attracts them. The approach of the one part, and the departure of the other, are equally opposed by the currents induced in them. The same mode of explanation applies to the other experiments referred to.

ROTA'TION OF CROPS. The plants like the animals of the farm differ much in their habits, and in the different sorts of food on which they subsist. The broad-leaved clovers, turnips, and mangold abstract from the air a large proportion of the materials of their growth; whilst the narrower-leaved grains and grasses, especially if their seeds are ripened, partake more largely of mineral food withdrawn from the soil. The cereals require for their healthy nutrition large supplies of phosphoric acid and silice; leguminous plants devour a large share of lime; turnips, carrots, and clover take up a great amount of potash. Corn-crops, occupying the ground during the greater part of the year, favor the growth of weeds; well-tended root-crops, on the other hand, afford better opportunity for deep culture, for the extirpation of weeds, for the convenient application of manures; whilst, being in great part consumed on the land, they raise its fertility. Mainly from such considerations, the farmer of arable land is led to grow a succession of dissimilar plants, or, in other words, to adopt a rotation of crops. The cereals exhausting the farm, on account of their ripened seeds being sold off, are generally alternated with fallow, root, or cleansing crops, or with beans and peas, which occupy a kind of intermediate position between the cereals and the roots; whilst clovers or grasses are taken at intervals of six or eight years. The rotation most suitable for a particular farm is, however, greatly modified by various circumstances, and especially by the nature of the soil, climate, markets, available supplies of extra manures, amount of live-stock kept, &c. That course of cropping is evidently the most desirable which will economically secure, with thorough cleanness of the soil, a high and increasing state of fertility.

Many rotations are based upon the Norfolk or four-course system, which consists of (1) Clover or mixed grass seeds; (2) Wheat, or in many parts of Scotland, oats; (3) Turnips, Swedes, mangold, potatoes, or bare fallow; (4) Barley. The details of this system are generally as follows. The clovers or grasses are mown or grazed; when cut, they are either used green or are dried for hay; the second crop is carted home for the cattle or horses; near towns, it is sold off; or it is consumed on the ground in racks by sheep, which on most highly cultivated farms receive besides a daily allowance of cake or corn. In districts where town-manure can be obtained, a top dressing is applied as soon as the first crop of grass is cut. On the poor and worse cultivated soils, the grass-crop occasionally remains down for two, or even three years, thus extending a four into a five or six years' rotation. The clovers or mixed seeds are ploughed up in autumn, and followed generally in England by wheat, and in Scotland by oats. These crops are now usually drilled, to admit of horse and hand hoeing. After harvest, the stubble is, if possible, cleaned by the scarifier, grubber, or plough and harrows; or, where the management for several years has been good, any patches of couch-grass or other weeds are best forked out by hand. The land, especially if heavy, or intended for mangold drilled on the flat, as practised in the drier parts of England, may then be manured and deeply ploughed: the grubber and harrows, in April or May, suffice to prepare for the drilling of mangold or Swedes. Heavy land, intended either for roots or barley, should, in spring, be ploughed or disturbed as little as possible. In Scotland, and the cooler moist climates of the north and west of England, turnips and potatoes are grown on raised drills or balks, in which the manure lies immediately underneath the plant.

Frequent horse and hand hoeing should insure the thorough cleaning of the crop. Unless in the neighborhood of towns, where it is greatly more profitable to sell off the whole of the root-crop, part of the Swedes or mangold is taken home for the cattle, but the largest portion is consumed by sheep in the field. After the fallow or cleaning crop, another cereal crop is grown: under the Norfolk system, this is generally barley, with which the clovers or seeds are sown out. Where sewage or tank water is available, Italian rye-grass is often used, and on land in high condition, early large and repeated cuttings are obtained; but rye-grass has the disadvantage of being a worse preparation than clover for the wheat-crop which usually follows. The chief failing of the four-course system consists in the frequent recurrence of clover, which cannot be successfully grown oftener than once

in six or eight years. To obviate this difficulty, one-half of the clover quarter is now often put under beans, peas, or vetches, thus keeping the grass or clover seeds eight years apart.

The Norfolk four-course system is unsuitable for heavy land, where a large breadth of roots cannot be profitably grown, and where their place, as a cleaning crop, is taken by bare fallow, vetches, or pulse. Bare fallows are, however, less frequent than formerly, being now confined to the most refractory of clays, or to subjects that are so hopelessly full of weeds as to require for their extirpation several weeks of summer weather, and the repeated use of the steam or horse ploughs, the scarifier, grubber, and harrows. In such circumstances, winter vetches are often put in during September or October, are eaten off by sheep and horses in June or July, and the land afterwards cleaned: this practice is extensively pursued on the heavier lands in the midland and southern counties of England.

In such localities, the following system is approved of—(1) The clover leas are seeded with (2) wheat; then come (3) beans, pulse, or vetches, manured, horse or hand hoed; (4) On good land, wheat succeeds; (5) Oats or barley often follow, but, to prevent undue exhaustion of plant-food, this system requires considerable outlay in artificial manures, cake, and corn; (6) A fallow, or fallow crop, deeply and thoroughly cultivated, and well manured, comes to restore cleanness and fertility; (7) Barley or wheat is drilled, and amongst this, the clover-seeds are sown. On the heavier carse-lands in Scotland, the following plan of cropping is generally practiced—(1) Clover; (2) Oats; (3) Beans; (4) Wheat; (5) Bare fallow or fallow crop, usually including a considerable breadth of potatoes; (6) Wheat; (7) Barley, with which the clovers or mixed grasses are sown. Under this system, it is difficult, with so few cleaning crops, to keep the land clean; roots, besides, are not produced in quantities sufficient properly to supply either cattle or sheep during the winter. To remedy these defects, roots may be introduced after the oats, and would be followed either by wheat or barley. This extends the rotation from seven to nine years.

In all well-cultivated districts, whether of heavy or light land, stock-farming is extending, and a more vigorous effort is being made to raise the fertility of the land. Root-crops are accordingly more largely grown; indeed, it is sometimes found profitable to grow two root-crops consecutively; thus, after turnips, Swedes, cabbage, or mangold, well manured from the town or farmyard, and eaten off by sheep, potatoes of superior quality are produced with one ploughing, and a dose of portable manure. Specialties of management occur in almost every locality. In Essex, winter-beans follow wheat, are got off in August, and are succeeded by common turnips. Near London, and in other southern districts, early potatoes or peas are grown for market, and are immediately followed by turnips. In many parts of England, where the soil and climate are good, rye or vetches sown in autumn are consumed in early summer, and a root-crop then put in.

Good rotations do not necessarily insure good farming; they are merely means to an end. By carefully removing weeds, by deeply stirring the soil, and by applying appropriate manures, wheat may be grown on the same soil for an indefinite number of years. At Lois-Weedon, in Northamptonshire, the Rev. S. Smith has for twenty years cultivated alternate three-foot strips of wheat and well-forked bare fallow; the land that is wheat this year being fallowed next. Although no manure whatever is applied, and only one-half of the experimental plot is each year under crop, the yield continues to stand at four quarters per acre, which is about four bushels per acre in excess of the average acreable produce of Great Britain.

The Lois-Weedon system, owing to the outlay which it entails for manual labor, probably could not be carried out with profit on a large scale. It demonstrates, however, the inherent resources lying dormant, especially in clay-soils, and indicates how they may be rendered available by thorough cultivation. It is mainly by such cultivation that steam-power proves so serviceable in our fields. The soil is turned up deeply to the disintegrating solvent influences of wind and weather; the necessary operations are rapidly overtaken in good season; much work is accomplished in autumn; treading and poaching of the surface is avoided; whilst a larger breadth of roots is attainable for the healthy and economical support of the sheep and cattle-stock, which not only directly enhance the returns of the farm, but also raise rapidly its manurial condition.

As agricultural education and enterprise extend, fixed rotations will be less regarded. The market-gardener, who extracts a great deal more from his land than the farmer has hitherto been able to do, does not adhere to any definite system of cropping. If the farm is kept clean and in improving condition, there can be no harm in growing whatever crops it is adapted to produce. Cropping clauses are only requisite during the three or four last years of a tenancy. The restrictions found in some agreements, preventing the growth of clover for seed, flax, and even potatoes,

are inadmissible. Equally objectionable are clauses against the sale of particular sorts of produce, such as hay or roots.

The farmer, if he is fit to be intruded with the use of the land, ought to be permitted to grow or sell off any crop he pleases, provided an equivalent in manure be brought back. On well-cultivated land, in good condition, it is now the practice of the best farmers to take oats or barley after wheat; indeed, some of the best maling barley in Essex, on the Scottish carse-lands, and elsewhere, is now grown after wheat. The frequent growth of cereals, and the heaviest of hay and root crops, even when removed from the farm, may be fairly compensated for by large doses of town-dung or of sewage. The plant-food disposed of in the more ordinary sales of the farm is economically restored by the use of bones or superphosphate, guano or nitrate of soda, or by keeping plenty of sheep, penning them over the land, and supplying them liberally with cake and corn.

ROTATORIA, or ROTIFERA, popularly known as **WHEEL-ANIMALCULES**, derive their name from the Latin word *rota*, a wheel. They have received these names on account of the apparent rotation of certain disc-like ciliated organs, which surround the mouth. Although some of the larger forms may be detected with the naked eye, they are as a class microscopical. They are widely diffused over the surface of the earth, inhabiting both salt and fresh water, and occurring in all climates. There has been much discussion as to their true place in nature. Ehrenberg regarded them as Infusoria, and Dujardin adopted a similar view. There is, however, no doubt that their organization is far more complex than that of the Infusoria, and the main question of dispute at the present day is whether they are most closely allied to the worms or to the crustaceans.

Huxley maintains that they form a link connecting the Echinoderms with the Nematoid (or thread) worms, and that they constitute the lowest step of the Echinoderm division of the Annelida; while Leydig endeavors to show that on various anatomical, physiological, and embryological grounds, they more nearly resemble crustaceans than worms, and proposes to call them *Ciliated Crustaceans*. Science is indebted to Leeuwenhoek for the discovery of this remarkable class of animals. In the *Philosophical Transactions* for 1702, he described one of the commonest of these animals, now known as *Rotifer vulgaris*, his attention having been especially directed towards its power of retaining its vitality after more or less complete desiccation—a fact which has been since confirmed by many other observers, and which is noticed in the article on **DORMANT VITALITY**. The R. have usually an elongated form, and are, in most cases, covered with a smooth hard skin, which is thrown into folds by the contractions of the subcutaneous tissue. The animal consists of a head and body. The body usually terminates in a prolongation, which, till recently, was termed the tail, but which is now known as the foot, and into which the intestines are never prolonged. The foot is composed of muscular and glandular structures, and often terminates in a pair of forceps, by which the animal can attach itself to leaves, &c. The body generally presents six segments, which are more or less distinctly marked in different genera.

The head presents the characteristic rotatory organs and the mouth, which always lies in the midst of them, so as to receive particles drawn in by their whirlpool action. It is by means of these organs that they swim freely about, revolving on their axis, or when at rest, producing vortex-like disturbances of the water. The form, number, and arrangement of these organs varies extremely in different genera, and has been made a basis of classification by Ehrenberg and others. The rotatory organ may be single, double, or multiple. It often consists of a disc supported by a pedicle, on whose borders are successive rows of regularly arranged cilia, the motion of which gives the appearance of rotation to the disc itself. In the genera *Floscularia* and *Stephanoceros*, these organs undergo peculiar modifications. In the former, there are five or six button-like processes about the mouth, covered with very long bristles, which move feebly and scarcely give rise to vortices; while in the latter, the rotatory apparatus consists of five tentacle-like ciliated processes, and the animal thus closely resembles the Polyzoa (q. v.). The ciliated rotatory organs, unlike ordinary volutile cilia, are entirely under the animal's control. The digestive apparatus differs extremely in the two sexes, which are always distinct in these animals. In the female, the digestive apparatus is well developed, consisting of a mouth opening into a muscular pharynx, which has two horny masticating organs which move laterally upon each other. The pharyngeal masticating apparatus is of a roundish form, and is composed of two jaws having one or several teeth, which are brought together laterally by the action of special muscles.

For further information on the subject, the reader is referred to a very exhaustive memoir by Mr. Gosse, 'On the Structure, Functions and Homologies of the Manducatory Organs of the Class Rotifera,' in the *Philosophical Transactions* for 1856. Successeding the pharynx is a narrow œsophagus which leads into a

dilated stomach, from which proceeds an intestine, which opens externally by an anus. In all the males that have been hitherto discovered, there is an entire absence of digestive organs, a rudimentary pharynx being the most that is ever observed. The nervous system in the R. consists of a cerebral ganglion, with filaments radiating from it. No heart or vessels have been discovered, but the respiratory organs are well developed. The sexual organs of the female are better known than those of the male. The ovary is round or oval, usually lies by the side of the stomach, and the oviduct proceeding from it usually opens into the cloaca. The ovaries only develop a few eggs at a time, and the nearly mature eggs may be readily observed in the body of the animal when examined under the microscope. These animals produce two distinct kinds of eggs, which are similar in their primary formation, but which differ in their ultimate destiny—namely, thin-shelled summer eggs, and thick-shelled winter eggs. The young are liberated from the former immediately after their discharge, while they remain unhatched in the latter during the winter weather. As far as has hitherto been observed, the males, which are much fewer in number than the females, are developed only from summer eggs. Except in regard to their being totally devoid of a stomach or intestine, and in relation to the sexual organs (which in the male have been carefully examined by Mr. Gosse in his Memoir, 'On the Dicoelous Character of the Rotifera,' in the *Philosophical Transactions* for 1857), the organization of the males is similar to that of the females.

Fig. 1.—Male Egg, just laid.

Fig. 2. Female Egg, nearly mature.

The sexes are, however, so unlike that they would be taken for widely remote genera, if their actual hatching had not been observed; the males and the eggs from which they spring being much smaller than the females and the eggs from which they are produced. (In *Brachionus amphicerus*, the female eggs were $\frac{1}{16}$ th of an inch in length, while the male eggs were only $\frac{1}{32}$ th). The accompanying figures represent the male and female of *Brachionus dorsalis* when newly born. The length of the latter an hour after birth was $\frac{1}{16}$ th of an inch, while the diameters of the empty shell were only $\frac{1}{32}$ th $\times$ $\frac{1}{32}$ th of an inch—a marvelous increase

Fig. 3.—Male *Brachionus dorsalis*.

Fig. 4.—Female *Brachionus dorsalis*.

in so short a period. 'Whether,' says Mr. Gosse, 'certain individuals produce only males, and others only female young, or whether separate impregnations are required for the production of the separate sexes, I do not know; but from all my observations I gather that the development of the one sex never takes place coetaneously with that of the other; for male and female eggs are never seen attached to the same parent, and the immature eggs in the ovary invariably develop themselves into the same sex as those which are already extruded. The duration of life in the male is always very brief; I have never been able to preserve one alive for twenty-four hours. Their one business is to impregnate the females, and for this momentary occupation no

supply of loss by assimilation of food is wanted, and hence we can understand the lack of the nutritive organism.'

ROTCHÉ (*Mergulus* or *Cephus*), a genus of the Auk family (*Alcedo*), separated from the true auks on account of the thick, short, and indistinctly grooved bill. The COMMON R. (*M.* or *C.* *melanoleucus*, or *M. alpe*, formerly *Alca alpe*), known also as the LITTLE AUK, SEA DOVE, DOVEKIE, and GREENLAND DOVE, is about the size of a large pigeon; its general color is black, but the belly is white, and there is a white mark upon each wing. It is very abundant in the arctic seas, and immense flocks are seen on the coasts of Greenland, Spitzbergen, Melville Island, &c. It is, however, truly oceanic in its habits, and scarcely visits the land except during the breeding season. Though comparatively rare on the British coast, it is pretty frequently seen in the Orkneys. Under the article AUK will be found figures of the Great and Little Auks.

ROTCHÉ, RICHARD, one of the first speculative divines of Germany, was born at Posen in 1799, and became successively member, professor, director, and ephorus of the Theological Seminary of Wittenberg. In 1837, he was nominated Professor of Theology at the university of Heidelberg, which in 1849 he exchanged for Posen. In 1854, however, he removed again to Heidelberg. Vigorous grasp and independence of thought were his chief characteristics, but he never formed a school, in the strict sense of the term. One of his well-known works is the *System of Theological Ethics, or Moral Theology*—a complete system of speculative theology or theosophy. This work is to show that religious truth is not a series of disputable propositions, but a divine morality; in a word, to translate the scholastic dialect of the creeds back into the living language of the Sermon on the Mount. Another remarkable book of his is the *Beginnings of the Christian Church*, which, by the peculiarity of 'stand-point' assumed by the author regarding church and state, evoked many fierce counter-treatises, like Baur's *On the Origin of Episcopacy*. R. died at Heidelberg in 1867. His lectures on *Dogmatics* were published in 1870; *Sermons*, in 1872; and *Quiet Hours* (*Stille Stunden*), the same year.

RO'THENBURG AN DER TAUBER, a small ancient town of Bavaria, on the Tauber, 31 miles south-south-east of Würzburg. Pop. (1880) 6504, who manufacture woollen cloth, paper, and gunpowder, and trade in corn and cattle.

RO'THERHAM, a market-town in the West Riding of Yorkshire, 6 miles east-north-east of Sheffield, is situated on the slope of a hill on the right bank of the Don, immediately below the junction of that river with the Rother. On the middle of the ancient stone bridge that crosses the Don is a Gothic chapel formerly used as a prison. The Free Grammar School, founded in 1584, and restored in 1858, and the court-house, are handsome buildings. In the neighborhood are numerous coal and iron-mines, which furnish materials for the manufactures, the chief of which are stoves, grates, nails, and engines. Pop. (1871) 25,892; (1881) 34,782. The Union Poorhouse is a spacious structure, capable of holding 314 inmates. The Union comprises 27 townships or parishes.

In the vicinity of R. are Roche Abbey, erected in 1147, and the masonry of which is still in a perfect state; and Conisborough Castle, a massive ancient stronghold, which is still in a good state of preservation, but which will survive its natural decay in Scott's *Ivanhoe*.

RO'THESAY, a royal burgh, seaport, and favorite watering-place of Scotland, capital of the county of Bute, is beautifully situated on the north-east shore of the island of that name, at the head of a deep bay, 40 miles west of Glasgow by the river Clyde. The bay offers safe anchorage in any wind, and is spacious enough to contain the largest fleet. Owing to its numerous excellent schools and seminaries, hotels, shops, and warehouses, R. presents all the advantages of a town, while the beautiful bay, and the charming scenery of the island, render it a favorite resort for sea-bathing and summer residence. The sheltered position, and the extreme mildness of the climate, have made it the resort of large numbers of invalids, especially such as are affected with pulmonary disease. Fishing is the employment of a number of the inhabitants, and shipbuilding is carried on to a small extent, and at the pier nearly all the Clyde steamers to and from the West Highlands regularly touch. The harbor is commodious and solidly built. Pop. (1881) 8329, which increases indefinitely during the bathing season. Within recent years, a very handsome promenade has been constructed. There is an excellent hydropathic establishment, and also an aquarium. In the middle of the town are the ruins of Rothesay Castle, which first receives historical mention in 1263. It has remained in ruins since 1685. The Marquis of Bute has done a great deal to render this ruin a picturesque object to visit, and has cleared away some of the old houses which were too near it.

ROTHSCHILD, MEYER ANSELM, baron of the Austrian empire, was born in the Jews' Alley, Frankfurt-on-the-Main, in

1743, and died in 1812. He was brought up to be a priest of the Hebrew faith. Being a man of good character, he was employed by the senate to raise a loan in order to save Frankfurt from pillage by the French republican army. He obtained a loan from the Landgrave (afterwards elector) of Hesse Cassel. The Landgrave acquired immense sums by selling his subjects to fight for England and France. Napoleon, after the battle of Jena, pronounced the forfeiture of his estates, and a French army was on the march to his capital. He had accumulated in his palace vaults about a million sterling in silver, and sending for R. to Cassel, he offered him the free use of the treasure, without interest, if he would convey it to a place of safety. With the aid of his Jewish friends, R. succeeded in secreting the money, and thus saved it from the hands of the French. At this time he had five sons, three of whom—Anselm, Nathan, and Solomon—being grown up, he associated with himself in business. ANSELM remained with him at Frankfurt. NATHAN came to England in 1800, where he acted as agent for his father, first at Manchester, in the purchase of Manchester goods for the Continent. He then removed to London, where by the agency of his father large sums of money were placed at his disposal, and invested by him with so much judgment, that his capital multiplied with great rapidity. He was appointed, by the interest of the landgrave, agent for the payment of the £12,000,000 sterling, which, by the treaty of Toeplitz, Great Britain stipulated to pay to her German allies. A large profit accrued to the house by this transaction.

Previous to R.'s death (which occurred in September, 1812), he saw his five sons securely established as the monarchs of European finance—Anselm in Frankfurt, Nathan in London, Solomon in Vienna, James in Paris, and Charles in Naples; all united in the wealthiest co-partnership of the present, or probably any other age. Nathan, in London, is said to have known the result of the battle of Waterloo several hours before the English government, and the knowledge is said to have been worth £200,000 to him. The loans contracted by the firm during the great war with France were not more remarkable for their magnitude than their success. They never took a bad loan in hand, and hardly any good loans fell into other hands. In addition to their five principal establishments they have agencies in many other cities both of the Old and New World. On two or three occasions the Rothschilds have successfully exerted themselves to preserve the peace of Europe. Their losses from the French revolution in 1848, and from the depreciation in the funds and securities which followed the subsequent disturbances in various capitals of Europe, were estimated at the enormous figure of £8,000,000 sterling—a wild estimate, but proving the popular belief in the immense resources of the firm. Nathan, after his father's death, was considered the chief of the family. The emperor of Austria made him a baron of the Empire in 1822. He died in 1836, at Frankfurt, whither he had been called by the marriage of his eldest son, Lionel, to his cousin Charlotte, daughter of the Baron Charles.

Anselm, Solomon, and Charles all died in 1855, the first-named dying childless at Frankfurt, and leaving a fortune valued at from 40,000,000 to 50,000,000 florins. James died in 1868.—Baron LIONEL DE R., eldest son of Nathan, and head of the London house, was born in London in 1808, and educated at Göttingen. He was early initiated by his father into the business of the firm, and successfully applied himself to extend its colossal operations. He was elected for London in 1847, 1849, 1852, and 1857, and at each election claimed to take the oaths and his seat in the House of Commons. 'The latter words of the oath—"on the true faith of a Christian"—he insisted upon omitting, "as not being binding on his conscience." He was then desired to withdraw from the House, and patiently awaited the fate of the bill of Jewish Emancipation, which usually passed the Commons, and was rejected by the Upper House. In 1858 he was placed on a committee which was to hold a conference with the House of Lords, and this was virtually the means of establishing Jewish emancipation. The Commons sent up another bill, and a general belief prevailed that if it were, like the rest, thrown out by the lords, Jewish members would be admitted by resolution of their own House, instead of by act of parliament. The lords gave way, merely taking measures to prevent the admission of Jews into the upper chamber. Baron R. thereupon (July 1858) took the oaths and his seat. He sat till 1868, when he was rejected, but was re-elected in 1869; and lost his seat in 1874. He died 3d June 1879. His brother NATHAN, his son NATHANIEL, and other members of the Hebrew faith, have also been elected to the House of Commons.

As the members of each successive generation are received into the copartnership, and the cousins usually intermarry, and as their immense wealth is being continually augmented by a profitable business, the name and operations of the firm, as public-loan contractors, dealers in bullion, and bill-discounters, promise to last as long as some royal dynasties. It was this firm that, in 1875, supplied the £4,000,000 necessary for the purchase of the Suez Canal shares.

ROTIFERA. See ROTATORIA.

ROTTENBURG, a town in Württemberg, seven miles southwest from Tübingen, is situated on the Neckar. Pop. (1880) 7018. The castle, built in 1216, is now the House of Correction. In the neighborhood are extensive hop-fields, orchards, and vineyards. The Roman station Sumelocennis stood on the site of R., and remains of roads and viaducts have been found. R. is the seat of a bishop.

ROTTENSTONE, a mineral consisting chiefly of alumina, with about ten per cent. of carbonaceous matter, and a little silica. It is supposed to be formed by decomposition of shale. It is found in Derbyshire, England, in Wales, and near Albany, in the state of New York. It is brown; either grayish, reddish, or blackish. It is soft, and easily scraped to powder, and is well-known to housewives, being much used for cleaning and polishing brass and other metals.

ROTTERDAM (*dam* or dike of the *rotte*), after Amsterdam, the largest city in the Netherlands, and a place of great commercial activity, is situated at the confluence of the Rotte with the Maas, in the province of South Holland. It forms a triangle with the apex to the north, and the base stretching along the river, ships from all parts of the world discharging their cargoes in front of the Boompjes, a splendid row of houses shaded with trees. The Hoog Straat, built on the dam or dike formed to repel inundations, divides the city into the Binnenstad and Buitenstad, the former being north of that line, the latter extending southward to the Maas. Broad canals or havens, full of shipping, cut the Buitenstad into islands, and lofty houses face the quays on either side. The largest canals are the Leuvenhaven and Oudehaven, which trend inward from the Maas, and the Scheepmakershaven, Wijnhaven, Blaak, Haringvliet, and Nieuwhaven, parallel with the river. R. is rapidly extending in all directions. The population has more than doubled within 50 years, and in 1872 it amounted to 123,677, or 53,411 males and 65,266 females. In 1881, the number had risen to 157,270. About two-thirds are Protestants, nearly one-third Roman Catholics, and 4500 Jews.

The industries are varied, including sugar-refining, gin-distilling, the making of liqueurs, beer-brewing, iron-founding, soap-boiling, the manufacture of vinegar, cigars, patent oil, sail and hair cloths, articles of gold and silver, shipbuilding, &c. The works of the Netherlands Steamboat Co., at Feijenoord, employ 700 men. The shipping trade is extensive. There is a shipping line to New York and Java, and several lines to various ports in the Baltic. For the large transit-trade, chiefly with Germany, there are about 30 steam lines to England, 5 to Scotland, and 2 to Ireland. Between 1870 and 1880, about four-fifths of the steamers and one-third of the sailing-vessels that entered the port were from Britain or her colonies.

Refined sugar is extensively exported. Large quantities of butter, cheese, yeast, madder, flax, and fruits are annually sent to Great Britain; also immense numbers of cattle, calves, swine, and sheep.

R. has railway communication with the other cities of the Netherlands, Germany, and Belgium. It is about 20 miles from the mouth of the Maas, the great commercial highway between the open sea and the Rhine provinces of Prussia. The municipal government consists of a burgo-master, 4 wethouders (aldermen or bailies), and 34 councillors. R. has 4 Dutch Reformed churches, 1 French Protestant, 1 English Episcopal, 1 Scotch church, 6 Roman Catholic chapels, and 1 Jewish synagogue. The schools are good, and subsidized by the municipality. There are 3 for gymnastics; a normal school; one for training boys for sea; a medical school; an institute for the deaf and dumb, at which 93 boys and 52 girls are educated by 15 teachers, 64 of the pupils being admitted free; a grammar school called the Erasmus; and several institutions for arts, sciences, architectural drawing, and music. The medical school has an anatomical museum; the Batavian Society possesses a good collection of philosophical instruments, books, and models. The Museum Boijmans, with many valuable paintings and works of art, was destroyed by fire in 1863. The Exchange, built in 1722, is a plain rectangular building of hewn stone. The hospital, on the Coolingsingel, a handsome erection, with excellent internal arrangements, can receive 250 patients. R. has also a children's hospital, which is a great boon to the poor.

The St. Laurence Church, built at the end of the 15th c., is a spacious building, resting on 14 Gothic pillars, and ornamented with a high truncated tower, the top of which is reached by 326 steps. It has a splendid organ, and several beautiful marble monuments, in honor of De Witt, Admiral Kortenaar, and other distinguished men. A bronze statue of Erasmus stands on the Great Market, and the house in which he was born is pointed out in the Breede Kerk Straat, which leads to the Great Church. The city has been added to and improved, and the water-way to the sea deepened and altered (the works completed in 1872), so as to

avoid, as far as possible, the hindrances to the navigation which are caused by the sand-banks at the mouth of the Maas.

ROTTI, an island in the Indian Archipelago, belonging to the Dutch, lies to the south-west of Timor, between 10° 39'—10° 56' S. lat., and 122° 57'—123° 29' E. long.; pop. 75,000. Its greatest length, from east to west, is 36 miles, and the breadth from Termano, on the north, to Tilly, on the south, about 11 miles. The surface, though lilly, is nowhere more than 600 feet above the sea, and the fertile soil produces a rich vegetation.

The most valuable product is the Lontar palm, the wine or juice of which, either used fresh or thickened by boiling and preserved in pots, forms a leading article of food. Next in importance is the Gabang tree, which bears large quantities of fruit, in size and shape like apricots, the fibre yielding a good tow, and the pith a sort of sago. Coco-nut, plantain, banana, and mango-trees are abundant. There is a great variety of timber trees, as beautiful ebony, mahogany, and several sorts well adapted for ship-building. R. is famed for a small but hardy race of horses, and has buffaloes, sheep, goats, swine, and deer. Edible nests, trepan, tortoise-shell, and wax, also horses, swine, palm-wine, syrup, sugar, and native sail-cloth are exported to Timor; and cotton fabrics, cotton, beads, iron, iron-work, powder, guns, and arrack received in exchange.

ROTTIERA, a genus of trees of the natural order *Euphorbiaceæ*, with a 3—5 parted calyx, no corolla, 30—40 stamens springing from the convex receptacle, and a 2—4 coccous capsule, each portion having one seed. The species are rather small trees, found in India and other tropical parts of Asia. *R. tetraecocca* grows in Sylhet, and yields a hard and valuable timber. *R. tinctoria* is a native of India, from the Coromandal coast to the northern forests. Its capsules are covered with short stiff hairs, which, when rubbed off, have the appearance of a fine red powder, are used in India for dyeing silks scarlet and orange, and form an article of commerce in that country. Professor Anderson of Glasgow has examined this dye-stuff, and in the *Edinburgh Philosophical Journal* for April 1855, has stated his opinion that it merits the attention of silk-dyers. The color which it yields is of great beauty and great stability.

ROTTWEIL, a small town of Württemberg, on the Neckar, 88 miles east-north-east of Freiburg in Baden. It contains a beautiful exchange, and a number of interesting churches. Its manufactures are gunpowder, silk, cotton, and woollen fabrics, and its corn-market is one of the most important in the kingdom. Pop. (1880) 6047.

R. is the site of an ancient Roman colony, among the ruins of which was discovered, besides a large number of other valuable antiquities, now preserved in the buildings of the gymnasium, a now well-known piece of mosaic work, upon which, among others, are an excellent drawing of Orpheus, and a number of profile drawings of the larger kinds of game, of chariot-races, and of gladiatorial encounters.

ROTUMA, a small island in the South Pacific, formally annexed to the Fiji Islands by Great Britain in 1880, is distant about 250 miles N.N.W. from the nearest island of that group. It is about 13 miles in length and about 5 in breadth. The soil is fertile, and readily produces sugar, coffee, cotton, yams, taro, bananas, &c. R. is well peopled, and the natives are friendly to the white man. R. was discovered by Captain Edwards in his search for the mutineers of the *Bounty* in 1791.

ROTUNDA, a building with circular exterior and interior, such as the Pantheon of Rome.

ROTURIER (according to Duncange, from *rupturarius*, a peasant; *ab agrum rumpendo*), one of the ignoble classes, who, during the early period of the feudal system, were separated from the high-born by almost as broad a line of demarcation as that which divided liberty from servitude. When the feudal theory of knight's-service came to be recognized as the only principle of gentle tenure, the term roturier came to be applied to the part of the population who continued to hold by the older or allodial tenure.

ROUBAIX, a flourishing manufacturing town in the north of France, in the dep. of Nord, and six miles north-east of Lille. It has risen into importance only in the present century. Numerous mills and factories, as well as dye-works and tanneries, are in operation. R. rivals Elbeuf and Louviers for woollen cloths and carpets, and vies with Laval and the rest of Flanders in linen manufactures. Pop. (1876) 74,946; (1881) 91,757.

ROUBLE, RUBLE, or RUBEL, the unit of the Russian money system. Pieces of peltry formed, in early times, the ordinary medium of exchange in Russia; but about the beginning of the 15th c., silver bars came more and more into use for larger payments, and to make up intermediate sums, pieces of the bars were cut off. It was in this cutting off, in Russian, *rubat*, that the name rouble originated. The present silver rouble is equivalent to 3s. 2½d. sterling, nearly. Half, quarter, fifth, tenth, and twen-

cieth parts of a rouble are also coined in silver; and gold coins of nominally five roubles (demi-imperials) and three roubles (imperial lucats) are also in circulation. In 1877 the paper rouble had fallen from 3s., its nominal value, to 1s. 10d. The R. is divided into 100 kopeks.

ROUEN (Lat. *Rotomagus*), one of the principal manufacturing and trading cities of France, and the capital of the dep. of Seine-Inférieure, is situated on the right bank of the Seine, 87 miles north-west of Paris by railway. The ramparts have been converted into spacious boulevards, which, as well as the quays that line the river-banks, are little if anything inferior to the boulevards and quays of Paris. The deep waters of the Seine form a commodious port, which is generally crowded with ships of all nations, from vessels of 300 tons to the smallest river-craft. A stone-bridge and a suspension-bridge connect the Faubourg St. Sever, on the left bank of the river, with the city, which is at once one of the most picturesque and one of the busiest and liveliest places in France. Some of the streets are well and regularly built, with fine modern stone houses; but the greater part of R. consists of old, ill-built, but picturesque streets and squares, with tall, narrow, quaintly-carved, wooden-bound, and gabled houses. Among the many beautiful Gothic churches for which it is noted, the finest are the cathedral and the church of St. Ouen. The former, one of the noblest metropolitan churches of France, is a remarkably fine specimen of Gothic architecture. It is built in a cruciform shape, and has two towers at the sides of the west entrance, and a lofty tower (464 feet high) terminating in a cast-iron spire, which was erected after the destruction by fire in 1822 of the old wooden belfry, which bore the date of 1544. It was erected by Philippe-Auguste between 1200 and 1220, and contains, in its 25 highly-ornamented chapels, numerous monuments of great interest—among others, those of Duke Rollo of Normandy, and his son, William Long-Sword. The heart of Richard Cœur de Lion, buried in this church, is now preserved in the extensive Museum of Antiquities.

The church of St. Ouen, as large as the cathedral, is one of the most interesting buildings in R.; and in its present restored state, presents a pure and elegant specimen of Gothic architecture. Among the other buildings of R., the finest are the Palais de Justice, belonging to the 15th c. and built for the parliament of the province; the Hôtel de Ville, with its public library of 110,000 volumes, and its gallery of pictures; and the Hôtel Dieu, one of the largest of its kind. R. has numerous benevolent, educational and scientific institutions; and next to Lyon, is perhaps the most important manufacturing town in the empire. The principal branches of industry are cotton manufactures, including the checked and striped cottons specially designated as *Rouenneries*, nankeens, dimity, lace, cotton-velvets, shawls, &c. R. has also extensive manufactories of hosiery, mixed silk and wool fabrics, blankets, flannels, hats, cordage, cotton and linen yarns, shot, steel, lead, chemicals, paper, &c. Among other branches of industry, we may mention ship-building, and machinery in various departments. R. is the seat of an archbishop, a High Court of Justice for the department, a Tribunal of First Instance and of Commerce, &c. Pop. (1881) 105,906.

History.—As the original capital in France, of the Northmen, who took possession of it in 842, and settled there in accordance with the agreement which Charles the Simple was compelled to make with their leader Rollo, R. presents special points of interest to Englishmen. It was the residence of the Dukes of Normandy till Duke William, in 1066, on his conquest of England, transferred the seat of his court to London; and till the time of Richard Cœur de Lion, it continued to be the capital of Normandy, and was the seat of government of the Norman possessions of William the Conqueror's successors; but in 1204, it was taken by siege by the French king, Philippe Auguste, and annexed with main part of the duchy to the French crown. During the wars of Henry V. and Henry VI. of England, it was under the power of the English from 1419 to 1449, when it was retaken by the French under Charles VII. It was during this occupation by the English, that Joan d'Arc was burned alive (1431) as a witch in the square of the city, in which stands her statue, and which is called, in memory of her, Place de la Pucelle. R. was occupied by German troops in the war of 1870-1871.

ROUGE, a preparation of safflower, used to give an artificial color to the cheeks, and, when properly prepared, said to be perfectly innocuous to those who use it. The color is obtained through a long and elaborate process, by precipitating it from the safflower, by means of citric acid or lemon-juice, on to prepared cotton. It is then washed out of the cotton with a solution of soda, and again precipitated with citric acid; but previous to adding the acid, finely-powdered French chalk is added to the solution, which becomes colored, and falls down when the precipitation takes place, giving the necessary body, and a peculiarly silky lustre to the coloring matter. *Jeweller's rouge* is a preparation of iron formed by calcining sulphate of iron or green vitriol,

until the water of crystallization is expelled; it is then roasted in a strong heat, and afterwards washed with water, until it no longer affects litmus paper. *Liquid rouge* is the red liquid left in making carmine.

ROGUE CROIX, one of the pursuivants belonging to the heraldic establishment of England, generally allowed to be the most ancient, although the period of institution is uncertain. The title is derived from the red cross of St. George, the patron saint of England.

ROUGE DRAGON, the title of a pursuivancy founded by Henry VII., on the day before his coronation. The name is taken from the supposed ensign of Cadwaladyr, the last king of the Britons, ancestor of that monarch. The red dragon was also sometimes used by Henry VII. as a supporter.

ROUGE ET NOIR (Fr. 'red and black'), TRENTE-UN ('thirty-one'), or TRENTE ET QUARANTE ('thirty and forty'), is a modern game of chance, which is played by the aid of packs of cards on a table covered with green cloth. The table is of a form similar to that shown in the figure. It is divided into four portions, each marked in the center with a diamond, the diamonds being alternately red and black; and these quarters are further separated, two and two, by bands which cross the table at its narrowest part. At the end of the table are a series of concentric bands painted of a yellow color (not represented in the figure). The game is played as follows: one of the *tailleurs* (or dealers, who manage the table, take charge of the bank, and keep an eye on the players) takes up his position at one side of the table, opposite to the *croupier* (another *tailleur*), and unseals, in

the presence of the players, six packs of cards, which are first counted, then shuffled by several *tailleurs*, and returned to the first *tailleur*, who presents them to one of the players to be cut. This is performed by the insertion of a blank card in any part of the pack, which is then adjusted, and the game proceeds. Each player must stake his money on some one of the four chances, denominated *noir*, *rouge*, *couleur*, and *l'inverse*, which will be afterwards explained.

After the stakes have been laid on the table (those for the *noir* being laid on either of the quarters marked with a *black*; and those for the *rouge*, on either of the quarters marked with a *red* diamond; those for the '*couleur*' on one of the transverse bands; and those for the '*inverse*' on one of the yellow circles at the end of the table), the *tailleur* takes a handful of cards from the top of the pack, and deals first for the *noir*, taking one card after another from the top of the handful and placing them on the table side by side, till the number of pips on them amounts to more than 30, when he stops. He then deals out another row in a similar manner for the *rouge*, till, as before, the number of pips amounts to more than 30. In reckoning the number of pips, the ace is counted as one, the other plain cards according to the number of pips, and the court-cards 10 each. It will thus be seen that the number to which each of the two rows of cards amounts, must be more than 30 and not more than 40. If the value of the first row is nearer 31 than that of the second, then the first row, or *noir*, wins, if the contrary is the case, then the second row, or *rouge* wins. *Couleur* wins if the first card tabled by the *tailleur* is of the winning color; thus, for instance, if the first card laid down is a '*spade*' or '*club*,' *noir* wins; but if the first card dealt be not of the winning color, then *inverse* wins, and *couleur* loses. Two (and no more) of the four chances can be winning chances at one time; and the winning players have their stakes increased by an equal sum from the bank, and then withdraw their stake and winnings, while the stakes of the losers are raked by the *tailleurs* to the bank in the center of the table. When the value of the first, or *noir*-row, is equal to that of the second, or *rouge*-row, it is a *refait*, and the dealer must commence to deal anew from the cards remaining in his hand; when the *refait* occurs, the player may either withdraw his stake, or stake on a different chance, with the same or more or less money as he thinks proper.

The game of Rouge et Noir would be an even one between the players and the bank, were it not for the following regulation: When the points dealt for the *noir* and the *rouge* each amount to

81 ('un refait de Trente-et-un') the half of all the stakes on each of the chances belongs to the bank, and this the players may either pay or have their stakes 'put in prison,' the next deal determining whether they shall belong to the bank or be restored to the player. If a second doublet of 31 occurs in the deal immediately succeeding, the stakes which were in prison are diminished by one half, which goes to the bank, and the other half is 'put into the second prison,' from which it requires two successive winnings of the player to regain them. The chance of 'un refait de trente-et-un' is about once in 64 deals.

This game superseded *Flaro* (q. v.), and *Biribi* in France about 1789, but along with *Roulette* (q. v.), was forbidden by law in 1838.

ROUGH-CAST, a kind of coarse plaster mixed with gravel, which is applied to the exterior of walls to protect them from the weather. It is also called *Harling* in Scotland, where it is much used.

ROUHER, EUGENE, a very eminent French statesman, was born at Riom, on November 30, 1814. He first distinguished himself as an advocate at the bar of his native town, at which he practised up to 1848. The attention of the country was first drawn to him by the ability he showed in a press prosecution, in which he was engaged for the defence. In 1848, he was returned by the department of Puy-de-Dôme to the Constituent Assembly, which was summoned after the revolution of that year, and in the following year he was returned to the Corps Législatif by the same department. On the break-up of Odillon Barrot's cabinet, the first ministry of Louis Napoleon, towards the end of 1849, R. was appointed Minister of Justice; and with slight interruptions, he has been since then a member of the French government. In the Corps Législatif, he showed himself a moderate politician; and he never affected to consider the Republic an improvement on the constitutional system which had preceded it. In 1852, he was appointed Vice-president of the Council of State, with the oversight of the departments of Legislation, Justice, and Foreign Affairs. In 1855, he was appointed Minister of Agriculture, Commerce, and Public Works, and in this office he found extraordinary opportunities for the exercise of his administrative ability. In the negotiation of the Treaty of Commerce with England, which—much derided both in France and in England at first—is now admitted to have conferred immense advantages upon both countries, the negotiations were conducted by M. R. and M. Baroche on the part of France, by Lord Cowley and Mr. Cobden on the part of England; the treaty was signed on January 22, 1860.

The arrangements consequent upon the treaty involved immense labor and manipulation of details, and the chief part in adjusting them devolved upon M. R. and Mr. Cobden. In 1863, he negotiated a Treaty of Commerce between France and Italy, receiving from the king of Italy, in acknowledgment of his merits, the Orders of St. Maurice and St. Lazaire. He has thus been the chief instrument in the introduction, or in preparing the way for the introduction, of free trade as the commercial policy of France and the neighboring continental countries.

In June 1863, M. R. retired from the ministry of Agriculture and Commerce, and was appointed President of the Council of State in succession to M. Baroche. Soon after, he took the office of Minister of the Interior; and in October 1863, on the death of M. Billault, he was appointed Minister of State. In this office, he had to represent the government as 'talking-minister' in the Corps Législatif; and it is admitted that he had no superior as a debater among the great orators trained under the constitutional system, and these were able rivals. His reputation as a debater stands as high as his reputation as an administrator; and it may safely be said that he has no superior, if any equal, for ability among the French politicians of the time. In January 1867, when the late emperor, by a decree, introduced certain modifications of the privileges of the Corps Législatif, and of the relations between that body and the ministers, M. R., with the other members of the cabinet, resigned office, but he was immediately reinstated in it. He was appointed a member of the French Senate on the 18th of June 1856. He became Grand Officer of the Legion of Honor in 1856, and gained the Grand Cross in January 1860. He was returned to the National Assembly for Corsica in 1872.

ROULERS, a town of West Flanders, Belgium, 19 m. S.S.W. of Bruges. In the vicinity flax is extensively grown, and in the town linen is largely bleached and manufactured. Pop. (1870) about 14,200.

ROULETTE (Fr. 'a little wheel'), a game of chance which, from the end of last century till the beginning of 1838, reigned supreme over all others in Paris. It continued to be played at German watering-places till 1872, when it ceased in terms of an act passed four years before. R. is still played at Monaco, in Italy. As much as £8000 a year used to be spent in the papers of Paris alone advertising this game, which is purely one of

chance, and is played on a table (see fig.) of an oblong form, covered with green cloth, which has in its center a cavity, of a little more than two feet in diameter, in the shape of a punch-bowl. This cavity, which has several copper bands round its sides at equal distances from each other, has its sides fixed, but the bottom is movable round an axis placed in the center of the cavity; the handle by which motion is communicated being a species of cross or capstan of copper fixed on the upper extremity of the axis. Round the circumference of this movable bottom are 38 holes, painted in black and red alternately, with the first 36 numbers, and a single and double zero, as shown in the figure; and these 38 symbols are also figured at each end of the table in order that the players may place their stakes on the chance they select. Along the margin of the table and at each end of it are painted six words, *pair, passe, noir, impair, manque, rouge*, which will be afterwards explained.

Those who manage the table and keep the bank are called *tailleurs*. The game is played as follows: One of the *tailleurs* puts the movable bottom in motion by turning the cross with his forefinger, and at the same instant throws into the cavity an ivory ball in a direction opposite to the motion of the bottom; the ball makes several revolutions, and at last falls into one of the 38 holes above mentioned, the hole into which it falls determining the gain or loss of the players. A player may stake his money on 1, 2, or any of the 38 numbers (including the zeros), and shows what number or numbers he selects by placing his stake upon them; if he has selected a number or zero corresponding to the one into which the ball falls, he receives from one of the *tailleurs* 36 times

Roulette Table.

his stake—viz., his stake and 35 times more—if he selected only 1 number, 18 times if 2 numbers, 12 times if 3 numbers, &c. The blank rectangles at the bottom of each of the 8 columns of numbers figured on the table, are for the reception of the stake of that player who selects a column (12 numbers) as his chance, and if the ball enters a hole the number of which is found in his column, he is paid 8 times his stake. Those who prefer staking their money on any of the chances marked on the edge of the table, if they win, receive double their stake (their stake and as much more), and under the following circumstances: The 'pair' wins when the ball falls into a hole marked by an even number; the 'impair,' if the hole is marked odd; the 'manque,' if the hole is numbered from 1 to 18 inclusive; the 'passe,' if it is num-

bered from 19 to 36 inclusive; the 'rouge,' if it is colored red; and the 'noir,' if it is colored black.

If the ball should fall into either of the holes marked with the single or the double zero, the stakes of those players who venture upon the 6 chances last described are either equally divided between the bank and the players, or as is more commonly the case, they are 'put in prison,' as it is called, and the succeeding trial determines whether they are to be restored to the players or gained by the bank. Should it so happen that at this trial the ball again falls into one of the two holes (the chance against its occurring is 360 to 1) marked with zeros, then half of the stakes in prison are taken by the bank, and the remainder are 'put into the second prison,' and so on. The tailleurs thus have an advantage over the players in the proportion of 19 to 18. The player who bets upon the numbers labors under a similar disadvantage, for although the two zero-points do not affect him in the same way as the player who stakes upon one of the other 6 chances, still (supposing him to bet upon a single number) as the chances are 37 to 1 against him, he ought to receive 37 times his stake (besides the stake) when he does win, whereas he only receives 35 times that amount, a manifest advantage in favor of the bank in the proportion of 37 to 35.

ROUMA'NIA. See MOLDAVIA.

ROUME'LIA (Turkish *Rumeli*), a name used to denote an important portion of European Turkey, differing widely in area at various times, but most generally applied to the region between the Balkans and the Ægean, corresponding to the ancient Thrace and part of Macedonia.

ROUMELIA, EASTERN, a province of the Ottoman empire, lying immediately to the south of the Balkans. Pop. 816,000, of whom 575,000 are Bulgarians. Though remaining under the military and political authority of the Sultan, it had administrative autonomy conferred on it by the Berlin Congress of 1878. Internal order is maintained by a native gendarmerie and a local militia, the officers of which are appointed by the Sultan; and the Porte retains the right of defending the frontiers by fortresses garrisoned by Turkish troops. The governor-general, nominated by the Porte, must be a Christian, and the constitution is settled by a European commission.

ROUND, in Music, a short vocal composition, generally of a humorous character, in three or more parts, all written on the same clef. Each voice takes up the subject at a certain distance after the first has begun. The second voice begins the first part when the first begins the second part, and the third takes up the first part when the second begins the second part, the whole ending together at the mark of a pause, ♩, or a signal agreed on.

ROUND-FISH (*Coregonus quadrilateralis*; see COREGONUS), a fish found in the western parts of North America, from Vancouver's Island northwards, in the rivers on the western side of the Rocky Mountains, and in the Mackenzie and Coppermine rivers. It ascends the rivers in summer to spawn, spending part of its life, like the salmon, in the sea. It is a beautiful fish; seldom more than two pounds in weight, of a yellowish-brown color, paler on the sides and belly than on the back, with bright and glittering scales, each of which is edged with a narrow band of dark gray; the mouth very small, no teeth perceptible. Before spawning, it is loaded with fat, which, on the shoulders, almost amounts to a hump; but after spawning, it becomes thin, and its flesh watery and insipid. In a good state, it is a very delicious fish, rivalling in excellence its congener, the Whitefish (q. v.). This fish is an important article of food to the Indians of North-western America, and vast numbers are caught in the rivers as they ascend from the sea. They ascend in such numbers that no ordinary contrivances for fishing are necessary, but the fish are bailed out by baskets, little nets, wooden bowls, or even by the hand. They are cured by splitting and drying, like salmon. The R. readily takes a rough gaudy fly.

ROU'NDHEADS, a name given by the adherents of Charles I., during the English Civil War, to the Puritans, or friends of the parliament, who distinguished themselves by having their hair closely cut, while the Cavaliers wore theirs in long ringlets.

ROUNDLE, or ROUNDLET, in Heraldry, a general name given to charges of a circular form, which, in English heraldry, have more special names indicative of their tinctures; the R. or being, for example, called a *Bezant*; and the R. gules, a *Tortoise*.

Roundle.

ROUND ROBIN, a name given to a protest or remonstrance signed by a number of persons in a circular form, so that no one shall be obliged to head the list. The round robin originated in France, and the name is derived from the words *rond*, round, and *ruban*, a ribbon.

ROUND TABLE, KNIGHTS OF THE. See ARTHUR and NOVELS.

ROUND TOWERS. Tall narrow towers tapering gradually from the base to the summit, and found abundantly in Ireland, and occasionally in Scotland, are among the earliest and most remarkable relics of the ecclesiastical architecture of the British islands. They have been the subject of endless conjecture and speculation among antiquaries, who have connected them with pagan times and pagan rites; but the controversies regarding them have to a certain extent been set at rest by the investigations of Dr. Petrie; and there can be now no doubt that they are the work of Christian architects, and built for religious purposes. They seem to have been in all cases attached to the immediate neighborhood of a church or monastery, and like other early church-towers (an older invention than bells), they served as symbols of dignity and power—while they were also capable of being used as strongholds, into which, in times of danger, the ecclesiastics, and perhaps the inhabitants of the country around, could retreat with their valuables.

After the introduction of bells, they were also probably used as bell-towers. About 118 towers of this description are yet to be seen in Ireland—20 of which are entire or nearly so; and Scotland possesses three similar towers, at Brechin, Abernethy, and

Round Tower, Devenish, Ireland.

From Fergusson's (*Hand-Book of Architecture*.)

St. Eglishay in Orkney. They are usually capped by a conical roof, and divided into storeys, sometimes by yet existing floors of masonry, though oftener the floors have been of wood. Ladders were the means of communication from story to story. There is generally a small window on each story, and four windows immediately below the conical roof. The door is in nearly all cases a considerable height from the ground. The subjoined woodcut represents the tower at Devenish, in Ireland, which may be considered as a typical example of the class. It is 82 feet in height, and furnished with a conical cap. A battlemented crown occasionally supplies the place of the conical roof, and in one instance the base of the tower is octagonal. Dr. Petrie is inclined to think that a few of these remarkable structures may be as old as the 6th c.; but this great antiquity has been questioned by later writers, particularly Dr. Daniel Wilson, who considers it not borne out by the character of the architectural details, and would assign them all to a period ranging from the 9th to the 12th centuries. The source whence this form of tower was derived, and the cause why it was so long persisted in by the Irish architects, are points which have not yet been cleared up. Two round towers, similar to the Irish type, are to be seen in the yet extant plan of the monastery of St. Gall in Switzerland, of the first half of the 9th c.; and, in the Latin description attached to the plan, they are said to be *ad universa superspicienda*.

The church and towers as rebuilt at that date are no longer in existence; but the latter were probably introduced in honor of the founder of the monastery, who was the leader of a colony of Irish monks, who, early in the 6th c., carried civilization and religion into the fastnesses of the Alps. The form thus introduced became traditional in West Germany in the succeeding Romanesque style, where we have it reproduced with but little modification at Worms Cathedral and elsewhere. See Dr. George Petrie's *Ecclesiastical Architecture of Ireland anterior to the Anglo-*

Norman Invasion (Dublin, 1845); Dr. Daniel Wilson's *Prehistoric Annals of Scotland*.

ROUP, a Scotch legal term synonymous with Auction (q. v.).

ROU'SAY, or ROWSA, one of the Orkney Islands, between the island of Westray on the north, and Pomona on the south. It is 4 miles long, 3 miles broad, is hilly, and covered with heath in the center, but has a margin of fertile land along the shore. Pop. (1871) 860.

ROUSSEAU, JEAN JACQUES, a French author, celebrated not less for the singularities of his character, and the misfortunes of his life, than for the brilliancy and sentimental enthusiasm of his writings, was born at Geneva, 28th June, 1712. The family to which he belonged, was of French origin, but had been settled for more than a century and a half in the little republican city, where his father Isaac Rousseau was a watchmaker. Deprived of his mother a few days after his birth, R. was in infancy tenderly cared for by a sister of his father's. At the age of ten he was placed, along with a cousin, under the charge of a M. Lam-bercier, Protestant pastor of Bossey, near Geneva, with whom he remained two years. At fifteen, a profession was chosen for him after considerable deliberation—that of *procureur* ('attorney'), and he was sent to a M. Masseron, to acquire a knowledge of engrossing, but that gentleman quickly dismissed him as a hopeless subject. In 1725, he was apprenticed to an engraver of Geneva, named Abel Ducommun, a harsh and violent man, from whose vulgar tyranny the sensitive and impulsive youth took refuge in flight (1728).

Henceforth, to the end of his harassed and melancholy career, he was a wanderer; resting for a brief space in many homes, and making many friends, but always driven from the former, and robbed (or thinking himself robbed) of the latter. His first protector was a Madame de Warens, in Savoy, by whose exertions he was placed at a charity-school in Turin. Here, however, he felt himself so miserable that he ran off, lived ambiguously for some time with the wife of a merchant, but in spite of his 'innocent passion' was very properly kicked out of doors by the irritated husband on his return; after which he became a lackey in the house of the Countess of Vercelli, where (as stated by himself in his *Confessions*) he stole a silk ribbon and then accused a maid of the theft—in consequence of which both were dismissed. Finally, after certain vagabond adventures he returned to his protectress, but again fell into irregular courses, whereupon Madame de Warens conceived the amazing idea of rescuing the youth (who was now in his 21st year) from the temptations of vice by becoming his mistress herself. To preserve appearances, however, R. always addressed her as *Mamma*. In 1738, the two went to live at Charmettes, near Chamberry. Here R. fell into a state of hypochondria, and went to Montpellier to place himself under medical treatment, but on his way thither fell in with a young lady whose charms quite dissipated all his morbid delusions. On his return he found that Madame de Warens had consoled herself during his absence by another lover, whereupon he betook himself to Lyon, and lived as a house-tutor for three years. Thence he proceeded to Paris in the autumn of 1741—under the conviction that he had made certain grand improvements in musical notation (of which in fact he hardly knew the elements), and read a paper on the subject before the *Académie des Sciences*, but was told that his 'improvements' were 'neither new nor practicable.' However, he managed to live here in an obscure way until he got the appointment of secretary to M. de Montaigu, French ambassador at Venice.

After a stay of 18 months in the city of islands, he returned to Paris, and finding his superior intolerable, became intimate with Diderot, Grimm, D'Holbach, and Madame d'Épinay, the last of whom, in 1756, provided a charming retreat for him in the vicinity of Paris, called the *Hermitage*, where he lived with a young girl of low origin, named Thérèse le Vasseur, who bore him five children, all of whom were sent by him to the Foundling Hospital—perhaps the most scandalous act of his strange life. R. afterwards married Thérèse, who seems to have been a faithful and affectionate creature of small capacity. The causes of his rupture with the clique of Parisian philosophers and fine women, have been the subject of envenomed misrepresentation in France, but from the thorough and accurate researches of M. Morin (see *Essai sur la Vie et le Caractère de J. J. Rousseau*, Paris, 1851), it turns out that R. was really the victim of an elaborate and odious conspiracy on the part of men who betrayed the confidence that he reposed in them. The conduct of Grimm was especially shocking. Driven from the Hermitage in 1757, he again found a temporary asylum, with the Duke and Duchess of Luxembourg; but, in 1762, he found it necessary to retire to Switzerland, and fixed himself at Mothers-Travers in Neuchâtel, enjoying the protection of Lord Keith (Earl Marischal), then governor of that Prussian province. The intrigues of his enemies pursued him even thither, and after certain paltry persecutions, lay and clerical, he accepted the offer of David Hume to visit England,

where he arrived in 1766. Misunderstandings, however, ensued with the Scotch philosopher, and in the following year he returned to France, and was installed in the castle of Trye by the prince of Conti. He did not remain long there, nor did he enjoy peace. Calumnies of the grossest kind were circulated against him, and once more he sought security in precipitate flight. In 1770, he reappeared in Paris, where he lived in obscurity, but not in tranquillity, for eight years, when M. de Girardin offered him a refuge at his estate of Ermenouville, near the capital, in the beginning of 1778, and here the unhappy R. died on the 2d July of the same year.

R.'s personal character is a puzzle to moralists. There is no denying the vices and meannesses which stained it: these rest on the most unimpeachable testimony—his own. They are set forth with copious and melancholy sincerity in his *Confessions*, and the very incidents that lead us to condemn him most severely would never have been known to the world had he not chosen to reveal them. But he does not exculpate himself (as many suppose); on the contrary, he covers himself often with bitter and sad reproaches. On the whole, we are inclined to believe that he was, at bottom, an honest, warm-hearted, humane creature—free from guile, but full of a feminine jealousy, aggravated by long persecutions into a species of insanity; volatile, but not faithless; an erring, but withal a lovable mortal. His grand defect was in strength of will. 'A man in convulsions,' says Carlyle, speaking of R. (*Heroes and Hero-worship*), 'is not strong, though six men cannot hold him; and all through his spasmodic life, and the splendid sentimentalism of his writings, we are conscious of a 'forcible feebleness,' a want of genuine intellectual power and insight. His opinions in a philosophical point of view are valueless; men of any vigor or acuteness care nothing for his notions about the social contract—influential though they once were during that period of crazy enthusiasm and sham speculation, the French Revolution—nor for his shallow panegyrics on the 'Savage State;' but when he paints the emotions of a tender and voluptuous love, the rose-colored charm of his genius is irresistible. The most famous of his productions are *Discours sur l'Origine et les Fondements de l'Inégalité parmi les Hommes* (Amst. 1755); *Julie, ou la Nouvelle Héloïse* (1760); *Du Contrat Social, ou Principes du Droit Politique* (Amst. 1762); *Émile, ou de l'Éducation* (Amst. 1764); and *Les Confessions, suivies des Réveries d'un Promeneur Solitaire* (Geneva, 1782; posthumous); but besides these he wrote a vast number of miscellaneous essays, letters, and treatises. His *Œuvres Complètes* have gone through innumerable editions. See Morley's monograph (1873).

ROUSSETTE. See KALONG.

ROUSSILLON, formerly a province of France, was bounded on the N. by Languedoc, on the E. by the Mediterranean, on the S. by the Pyrenees, and on the W. by the county of Foix. It now forms the French department of the Pyrénées Orientales. In ancient times the capital was *Ruscino*, which stood in the vicinity of Perpignan.

ROUT, one of the absurd names given to a fashionable evening assembly in London towards the end of the 18th and early part of the 19th centuries. At these entertainments, as many as 2000 to 3000 ladies and gentlemen were invited, and when the apartments were not sufficiently spacious for the company, temporary rooms were erected in the rear of the house, and elegantly fitted up. Crowded assemblies of this kind are now known as 'soirées,' or 'at homes.' For an amusing account of them, we refer to Mrs. Stone's *Chronicles of Fashion*, vol. ii. p. 262.

ROUX. The name of a material used by cooks to thicken soups and gravies; it is made either white or brown. The former is prepared by putting a quantity of butter into a well-tinned stew-pan, and dissolving it gently over the fire. It is kept over the fire until it begins to simmer, when fine flour is dusted in with a dredge, and carefully incorporated, the flour being added until it is sufficiently thickened. It is then poured into a jar, and is ready for use. The brown is made in the same way, except that it is kept a longer time over the fire, which gradually gives it a rich brown color.

ROVE BEETLE, or COCKTAIL (*Staphylinus*), a genus of coleopterous insects, the type of a family, *Staphylinidae*, to very many of which the same English names are often extended; belonging to the section *Coleoptera Pentamera*, and tribe *Brachelytra*, of which a chief characteristic is the short square elytra, which leave the greater part of the abdomen exposed. The abdomen is soft and flexible, and these insects have a habit of turning up the point of it, particularly when annoyed, whence the name *Cocktail*. They feed on carrion; their larvæ, however, not unfrequently choose vegetable food, as young wheat, cutting the stem underground with their strong mandibles. The bite of some of the species is apt to cause bad sores. The species are numerous. Many of them have a fetid odor; a few have odors resembling those of fruits and flowers.

ROVERE'DO, a city of Austria, in the Tyrol, occupies a most beautiful and picturesque site in the Lagerthal, on the banks of the Leno, and close to the left bank of the Adige, 12 miles south of Trient by railway. R., one of the most flourishing towns in the Tyrol, is the center of the silk-trade. It contains 60 factories, in which 2800 hands are employed, and carries on besides some trade in wine and an active transit-trade. Pop. (1880) 8864. R. was the scene of a battle between the French and Austrians on the 3d and 4th of September 1796, in which the latter were defeated.

ROVI'GNO, a trading-town and seaport of Istria, stands on a rocky promontory which forms a double harbor 45 miles south of Trieste. The best Istrian wine is grown in the vicinity, which is also abundantly productive in oil. 30,000 casks of olive oil are exported annually; and shipbuilding, the usual manufactures to which a seaport gives rise, and the tunny and sardine fisheries, are the chief branches of industry. Pop. (1880) 9522.

ROVI'GO, a city in Italy, capital of the province of the same name, on the Adigetto, 88 m. S.W. of Venice. It is a handsome fortified city; has a cathedral, which contains some fine paintings, and a picture-gallery. Pop. 7500.

ROVING. See SPINNING.

ROVU'MA, a river of South-east Africa, which enters the Indian Ocean by a spacious bay north of Cape Delgado. Only a small portion near its mouth was known to Europeans till 1861, when Drs. Livingstone and Kirk attempted its ascent in the small steamer *Pioneer*, drawing five feet water. The river was then in flood, and had a strong current. After an ascent of 30 miles the difficulties of the passage induced the explorers to return. Another ascent was made by the same party during the dry season of 1862. With two ships' boats, they reached the rapids which limit the navigation, above 100 miles from the coast, and half-way to the Nyassa Lake.

Passing through gloomy, unhealthy forests of mangroves, they entered a healthy plain, covered with heavy timber and brilliantly flaming tropical plants; but the country was infested by the 'tsetse fly,' a serious obstacle to its development. The river abounded with hippopotami. The travelers came within two days of the town of N'gomano, where all the caravans cross the R., but could not leave the boats in order to reach it. Here the R. is joined by the Niende, a large affluent from the hills on the south-west; while the main stream comes from the west and north-west. As the R. is navigable for only a few months of the year, it offers little advantage for commerce; but it affords an excellent entrance by which to explore the regions between the Nyassa and Tanganyika lakes. During his last African journey, Dr. Livingstone and his party, leaving Zanzibar, in 1866, followed the course of the R. from a point not far from its mouth to where it is joined by the Leonde from the mountains on the south-west. From N'gomano, a town at that point, Livingstone went up the stream a considerable distance on his way towards Nyassa. In 1878 the Sultan of Zanzibar sent an expedition to the Upper R. to settle some disputes between the tribes there; and at the same time he succeeded in establishing a station on the river. Both Dr. Livingstone and Dr. Kirk, who were unable to pass the rapids which obstruct it, concluded that water-carriage to the Indian Ocean by the R. was impossible. At the request of the Sultan, Mr. Joseph Thomson examined the reported coal-fields of the R. in 1881, only to find that the coal consisted of a bituminous shale of no commercial value.

ROW'AN TREE, MOUNTAIN ASH, or QUICKEN TREE

Rowan, or Mountain Ash (*Pyrus aucuparia*).

(*Pyrus aucuparia*; *Sorbus aucuparia* of many botanists), a tree

abundant in Britain, especially in the Highlands of Scotland, and in many parts of continental Europe. It does not attain a great size, has in general a very straight erect stem, and is distinguished from the other species of *Pyrus* (q. v.) by pinnated glabrous leaves, terminated by a single leaflet, serrated leaflets, corymbs of small flowers, and small globose fruit. The wood is valued for its compactness. The inner bark and sapwood have a very peculiar smell. In the superstitions of the Scottish Highlands, and also of the Lowlands, a peculiar importance was assigned to the rowan tree, a mere twig of which was supposed to have great efficacy in scaring away evil spirits. It is very ornamental, especially when in fruit. The fruit (*Rowan berries*) is sometimes used for preserves. It has much acidity, and a peculiar bitterness. It is generally red; but there is a variety with yellow fruit; and a very nearly allied species, *P. Americana*, a native of North America, has purple fruit.

ROWE, NICHOLAS, a dramatic poet and translator, the contemporary and friend of Congreve, Addison, Steele, and the other wits of the Queen Anne period, was the son of a serjeant-at-law, and was born at Little Barford, in Derbyshire, in 1673. He was educated at Westminster, and studied law in the Middle Temple; but inheriting a small competency by the death of his father, he devoted himself to literature. Between 1700 and 1714, he produced eight plays, of which three were long popular, viz.—*Tamermelane*, 1702; *The Fair Penitent*, 1703; and *Jane Shore*, 1714. The character of Lothario in the *Fair Penitent* was the prototype of Lovelace in Richardson's *Clarissa Harlowe*, and the name is still the synonym for an accomplished rake. R. translated Lucan's *Pharsalia*, and his translation was so highly valued, that after his death his widow received a pension expressly on account of this service to literature rendered by her husband. He was also the first editor of Shakspeare, 1709. The popular talents and engaging manners of R. procured him many friends, and he was appointed to several lucrative offices. The Duke of Queensberry made him his Under-secretary of State. In 1715, he succeeded Tate as poet-laureate; and the same year he was appointed one of the land-surveyors of the customs of the port of London; the Prince of Wales made him Clerk of his Council; and the Lord Chancellor Parker created him Clerk of the Presentations. He died Dec. 6, 1718, and was buried in Westminster Abbey. As a dramatist, R. is characterized by an easy and elegant style of diction and versification, but is destitute of originality, subtlety, or force in the delineation of character or passion. In the construction of his dramas, 'there is not,' as Johnson remarks, 'much art;' but there is no gross violation of taste or decorum, and he excels in scenes of domestic tenderness.

ROWING. See BOATING.

ROXBURGHE, a county in Scotland, comprising the districts of Teviotdale and Liddesdale, with part of Tweeddale, extending in length about 40 miles, and in breadth 28 to 30 miles, is bounded on the E. and S. by Northumberland and Cumberland; on the S.-W. by Dumfriesshire; on the W. by Selkirk; and on the N. by Berwickshire. The physical aspect of the county is varied and picturesque, having the Cheviot and Lauriston hills bounding a considerable portion of its borders. The Cheviots do not rise to any great height, the highest attaining a height of 2685 feet. The herbage is green to the summit, and affords valuable pasture to sheep. The interior of the county is generally composed of good soil; and the farms being mostly large, and held by men of capital and skill, it is famed to the greatest advantage. Hawick is noted for its hosiery and woollen manufactures. The chief river is the Tweed, which flows through the northern districts of the county. The Teviot runs through the county a distance of 40 miles, and falls into the Tweed at Kelso. There are several other streams of note, the Allan, the Slitrig, the Jed, the Gala, &c. R. possesses an interesting history in connection with border feuds of former days; and it has many magnificent remains of monastic life and institutions, which, with its many legends and traditional stories, render it of much interest. The proprietors are not numerous—the Dukes of Roxburghe and Buccleuch, the Marquis of Lothian, the Earl of Minto, and a few others holding a great proportion of it. The area is 670 sq. m., or 428,494 acres. To the eye of a traveler, R. is the county of Perth in miniature. The valued rent of it in 1674 was £26,222 sterling; the new valuation for 1881—1882 was £427,951, including railways. In 1881, the total acreage under all kinds of crops, bare fallow, and grass, was 181,608; there was of wheat, 1448 acres; of barley, 15,538; of oats, 83,684; rye, 91; beans, 645; peas, 85. The total number of acres under corn crops was 51,486. The parliamentary constituency in 1881—1882 was 2031. Pop. (1861) 54,119; (1871) 49,407; (1881) 53,445. The county town is Jedburgh.

ROXBURGHE CLUB, a society of very considerable literary interest, called after John, Duke of Roxburghe, the celebrated collector of ancient literature. After the death of the duke, who died in 1805, his valuable library, rich in the old romances of chivalry and early English poetry—a very fine treasury in its way

—was, in 1812, brought to that hammer which almost always in an unmerciful manner scatters the gatherings of book-collectors, and the large prices realized for some of the books were unprecedented. As a specimen, it may be stated that a copy of the first work printed by Caxton in 1471, the *Recuyell of the Histories of Troye*, sold for £1050, 10s. The largest sum, however (and perhaps the greatest ever paid for a single printed volume up till that time), was given by the Marquis of Blandford (afterwards Duke of Marlborough) for the first edition of Boccaccio's *Decameron*, which fetched £2260. In commemoration of the interest which the sale of this collection occasioned among literary antiquaries, the R. C. was instituted, for the purpose of printing a limited number of impressions of MSS. and rare works for the use of its members, to whom they are strictly limited. The R. C. has in this way issued upwards of 80 very curious and interesting works, which are only, however, to be found in the collections of the members, or in a few of the larger public libraries. On the anniversary (June 17) of the sale of the copy of Boccaccio's *Decameron* above referred to, the Club holds a symposium in London.

The R. C. may be regarded as the parent of many literary societies subsequently founded for similar purposes, among which may be mentioned the Camden, Percy, Shakspeare, Cheetham, Wharton, and Surtees Societies, in England; the Bannatyne, Maitland, Abbotsford, and Spalding Clubs, in Scotland; and the Celtic Society in Ireland. The labors of these bodies in printing MSS. and fugitive black-letter tracts have added many important contributions to British literature.

ROXBURGHIAEÆ, a natural order of plants, belonging to the Dicotyledons (q. v.) of Lindley, twining shrubs with reticulated leathery leaves; and large, showy, solitary, foetid flowers; the perianth of four divisions, the stamens four, hypogynous, the ovary one-celled, the ovules numerous; the pericarp one-celled, 2-valved, with two clusters of seeds at the base; the seeds attached to long cords. The species are very few, natives of the hotter parts of the East Indies. The stems of *Roxburghia viridiflora*, a native of Chittagong, the Malayan Islands, &c., are sometimes 100 fathoms long. The roots are boiled and soaked in lime-water, to remove their acidity, and are then preserved in syrup, and eaten.

ROXBURY, formerly a separate city of Massachusetts, U. S., but now incorporated with Boston, built upon hills, and in hollows, which give it fine building sites and attractive scenery. Besides numerous elegant residences, churches, schools, banks, and newspapers, it contains many forges, steam-engine, and boiler factories, cordage-mills, and manufactories of cotton, wool, carpets, flax-cotton, organs, starch, glue, &c. Pop. (1870) 34,772.

ROY, WILLIAM, major-general in the British army, was born May 4, 1706, at Milton heat, in the parish of Carlisle, Lanarkshire. His early history is quite unknown, and the incidents of his professional career comparatively unimportant, but his name will always be remembered by succeeding generations as that of the first of British geodesists. After the great rebellion in 1745, he was employed in preparing for government a map of the Highlands, and finally of the whole mainland, which, however, owing to imperfect instruments, and the hurried nature of the survey, was only, to use R.'s own words, 'a magnificent military sketch.' R.'s next important operation was the measuring a base line (see **ORDNANCE SURVEY**) on Hounslow Heath; of 27,404 feet, or about 5½ miles, which, though the first measurement of the kind in Britain which pretended to accuracy, was executed with such care, that, on being remeasured after R.'s death, the difference between the two results was found to be only 2½ inches. For this splendid labor, R. received the Royal Society's Copley medal. R.'s labors connected with the survey extended from July 1787 till September 1788, when he returned to London in ill health, which necessitated his removal to the warmer latitude of Lisbon in the winter of 1789; but he returned to London in the following April, and died there 1st July 1790. In 1767, R. was elected a Fellow of the Royal Society, to whose *Transactions* he contributed, in 1777, a paper entitled 'Experiments and Observations made in Britain, in order to obtain a Rule for Measuring Heights with the Barometer.' He had also, during his survey of Scotland, paid particular attention to the camps and other Roman remains in that country, and had completed an elaborate work on this subject, illustrated by drawings and plans, and by a copy of his map of the country. This work was published (1793) by the Society of Antiquaries (of which R. had been a member), to whom it had been presented by R.'s executors. R. was also surveyor-general of the coasts of Great Britain.

ROYAL ACADEMY OF MUSIC, an institution founded in 1823, by a number of musical amateurs, headed by the Earl of Westmoreland, for the purpose of affording to a certain number of pupils the opportunity of obtaining a first-rate musical education, and of enabling those who make music a pursuit to provide themselves with the means of honorable livelihood. The Academy is chiefly supported by contributions and subscriptions, the sub-

scribers and contributors being divided into four classes, of whom the first three recommend and elect the students. A small sum is voted yearly by parliament for its maintenance. Of the scholars, some are boarders and some out-door pupils. The pupils are placed under the tuition of chosen instructors in every branch of musical education. The Academy was incorporated by royal charter in 1830. Since its foundation, a number of its pupils have gone forth to the world as musicians of eminence, including among others Sir W. Sterndale Bennett, Messrs. G. A. Macfarren, A. Sullivan, Brinley Richards, Madame Sainton-Dolby, &c. Concerts are given by the pupils, to which the public are admitted. See Cazalet's *History of the R. A. of M.* (1854). The Royal College of Music, chartered and endowed, is a distinct institution, promoted in 1882.

ROYAL ASSENT. See **PARLIAMENT**.

ROYAL FAMILY. In its more restricted signification, the royal family of Great Britain only includes the Queen-consort and Queen-dowager, and the children or other descendants of the sovereign. In a larger sense, it comprehends all the British descendants of the royal house, or perhaps, more properly, as indicated by Blackstone, all who may by possibility succeed to the throne. With regard to the position and rights of a Queen-consort and Queen-dowager, see **QUEEN**. The husband of the Queen-regnant is not as such a member of the royal family; but the style of Royal Highness, and a precedence next to Her Majesty, were conferred on the late Prince-consort by statute. The Prince of Wales (q. v.), or heir-apparent to the throne, and the Princess of Wales, are distinguished by law from the rest of the royal family. By the statute 25 Edw. III., to compass the death of the Prince of Wales, or violate the chastity of the Princess of Wales, is high treason. The eldest daughter of the sovereign is styled the Princess Royal, and the violation of her chastity is, by the same statute, high treason. The heir-presumptive to the throne has no special rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

The younger sons and daughters of the sovereign are entitled to a peculiar place in the House of Lords; statute 31 Henry VIII. c. 10 enacts that no person except the king's children shall presume to sit or have place at the side of the cloth of estate in the parliament chamber. On a reference by George II. to the House of Lords regarding the position and precedence of Edward, Duke of York, second son of his son Frederick, Prince of Wales, it was held that, under the description of the king's children, grandsons are included.

On a reference made to all the judges by George I., it was resolved that the education and care of the king's grandchildren, when minors, and also the approval of their marriages; belongs to the king, even during their father's lifetime. This care and approval has more recently been held to extend to the heir-presumptive, and it is difficult to say how far it comprises also the remoter branches of the royal house. There are frequent instances of the crown's interposition in the case of nephews and nieces, and a few in the case of more distant collaterals. Questions regarding the marriages of the royal family are now further regulated by the Royal Marriage Act (q. v.). The Prince of Wales, besides the revenues of the Duchy of Cornwall, has settled on him, by 26 Vict. c. 1, an annuity of £40,000, and the Princess of Wales £10,000 to be increased to £30,000, in case of her widowhood.

On the consolidated fund are charged £25,000 to the Duke of Edinburgh, £25,000 to the Duke of Connaught, £25,000 to Prince Leopold, £8000 to the Crown Princess of Prussia (till 1879, £6000 to the Grand-Duchess of Hesse), £6000 to Princess Christian of Schleswig-Holstein, £6000 to the Marchioness of Lorne, £6000 to the Duchess of Cambridge, £3000 to her daughter the Grand-Duchess of Mecklenburg-Strelitz, £12,000 to the Duke of Cambridge, and £5000 to Princess Teck, formerly Princess Mary of Cambridge.

ROYAL GEORGE, a British man-of-war, of 108 guns, the sudden sinking of which in Portsmouth harbor with all on board, 29th August, 1782, created a widespread feeling of sorrow and commiseration. The R. G. was the principal vessel of Lord Howe's fleet, and while she was undergoing repairs near the keel, she was too much heeled over, so that the water rushing through the port-holes of the depressed side, speedily filled her and she sank with all on board, including the admiral, Kempenfeldt, the captain, officers, crew, and about 300 women and children, who happened to be on board at the time—1100 in all. Of these, however, 200 were saved; but a small vessel, which happened to be anchored near, was drawn into the vortex occasioned by the R. G.'s descent, and swallowed up; and other vessels were also placed in imminent danger. Captain Waghorn, who escaped, was subsequently tried by court-martial for negligence and carelessness in the careening operation, but was acquitted. This calamitous event has been celebrated in an elegy by Cowper. Many of the guns were fished up soon afterwards, and several

schemes were projected for the raising of the ship bodily, but without success, until, in 1839, the mass was blown to pieces by the explosion of large metal cases filled with gunpowder. Most of the valuables which had been in the ship were brought up, and the brass guns which were recovered sufficed to defray the cost of the operation.

ROYAL MARRIAGE ACT. Act 12 Geo. III. c. 2 enacts that no descendant of the body of Geo. II., other than the issue of princesses married into foreign families, shall be capable of contracting marriage without the previous consent of the sovereign, signified under the Great Seal; and any marriage contracted without such consent is declared void. But such descendants, if above the age of 25, may, after twelve months' notice given to the Privy Council, contract and solemnize marriage without consent of the crown, unless both Houses of Parliament shall, before the expiration of the year, expressly declare their disapproval of such intended marriage. The penalties of Præmunire (q. v.) are attached to all persons who shall solemnize, assist, or be present at any such marriage. This act was passed in consequence of the marriage of the Duke of Gloucester, brother of George III., with the Countess Dowager of Waldegrave, and of the Duke of Cumberland with the widow of Colonel Horton and daughter of Lord Inrham. The marriage of the late Duke of Sussex in 1793 to Lady Augusta Murray, daughter of the Earl of Dunmore, was declared by the Prerogative Court to be a violation of the Royal Marriage Act, and therefore null and void, in August 1794; and the claims of their son, Sir Augustus d'Este, were declared invalid by the House of Lords in 1844. The Royal Marriage Act is heartily disapproved by many as impolitic and despotic, and as tending to immorality and scandalous conduct, and was not passed without great resistance in parliament. But the influence of the government was then too strong for public opinion.

ROYAL-MAST, the fourth mast from the deck, and usually the highest carried. It is most commonly made in one piece with the top-gallant-mast. It carries the royal-yard, which bears a sail called the 'royal.' The royal-mast is surmounted by the truck, at which the pendant or other flag is displayed when necessary.

ROYAL SOCIETY (OF LONDON). The origin of this Society may be traced back to those stirring years of civil strife that brought in the Commonwealth. Clubs for political, theological, and sectarian purposes were then numerous and active; and in the year 1645, 'divers worthy persons, inquisitive into natural philosophy, and other parts of human learning, did, by agreements, meet weekly in London on a certain day, to treat and discourse of such affairs.' Among these worthy persons were certain medical men, Dr. Wilkins, afterwards bishop of Chester; Foster, professor of astronomy in Gresham College; Wallis, the mathematician; and others, including a learned German from the Palatinate; and out of their meetings arose the now world-famous Royal Society. Wallis records that the subjects discoursed of were 'the circulation of the blood; the valves in the veins; the venæ lactææ; the lymphatic vessels; the Copernican hypothesis; the nature of comets and new stars; the satellites of Jupiter; the oval shape of Saturn; the spots in the sun, and its turning on its own axis; the inequalities and selenography of the moon; the several phases of Venus and Mercury; the improvement of telescopes, and grinding of glasses for that purpose; the weight of air; the possibility or impossibility of vacuities, and nature's abhorrence thereof; the Torricellian experiment in quicksilver; the descent of heavy bodies, and the degrees of acceleration therein; and divers other things of like nature.'

In 1662, the persevering philosophers were, through the 'grace and favor' of Charles II., incorporated by charter, in which they were described as the Royal Society of London for the promotion of Natural Knowledge. The king gave them also a mace, and subsequently granted two other charters conferring additional powers and privileges. They are inscribed in a handsome volume known as the Charter Book, which, containing, as it does, the sign-manual of the founder, of other royal personages, and of nearly every Fellow elected into the Society, presents a collection of autographs unequalled in the world.

Through many difficulties, the young society pursued their way. Their meetings were interrupted by the great fire and the plague; but in March 1664—1665, they published the first number of the *Philosophical Transactions*, and thus commenced a record of their labors and researches, and at the same time a history of science of the highest value, comprising upwards of one hundred and seventy quarto volumes. Besides this, the Society publish an octavo serial entitled *Proceedings*, in which an account of the ordinary meetings is set forth. This serial was commenced in 1800, and now fills about thirty volumes. Another publication, in eight large quarto volumes, is the *Catalogue of Scientific Papers*, containing the titles of scientific papers published in all parts of the world from 1800 to 1873. This great work, invaluable for purposes of reference, was compiled at the cost of the Society,

and gives in methodical form a record of the scientific progress of seventy-three years of the century. These works are not restricted to the Fellows, but are sold to the general public.

By increase of numbers—including scientific men on the continent, who were elected as foreign members—the Society widened their sphere of usefulness. They promoted the publication of Newton's *Principia* and optical works; they lent instruments to Greenwich Observatory in its early days, and were appointed visitors of that establishment by Queen Anne—a function which they still exercise; they aided travelers and scientific investigators; through force of circumstances, they became the advisers of the government on scientific subjects; Cook's celebrated voyage to observe the transit of Venus was undertaken at their instance; and from the voyage of the *Endeavour* down to the voyage of the *Challenger*, it would be difficult to specify a scientific expedition, which had not been equipped under the advice of the Royal Society.

In 1710, the Society removed to a house which they bought in Crane Court, Fleet Street. In 1780, by order of George III., quarters were assigned to them in the then new palatial building, Somerset House. There they abode until 1857, when, at the request of the government, they migrated westward to Burlington House, a wing of which they now occupy.

The Society's session commences on the third Thursday in November, and ends on the third Thursday in June. During this period, meetings are held weekly at 4.30 P.M. for the reading and discussion of papers, and these papers are for the most part afterwards published in the *Proceedings* or the *Philosophical Transactions*. The anniversary meeting is held on November 30. At that meeting, the Society elect a Council to carry on their work through the ensuing year. This council, comprising president, treasurer, and secretaries, numbers twenty-one persons.

The number of candidates for election into the Society averages between fifty and sixty every year. From these the council select fifteen, whose names are printed and sent to every Fellow, and in June the annual meeting takes place at which the fifteen are elected; but any Fellow is at liberty to alter the list of names. There are in all about 550 Fellows, including 50 foreign members.

The Society's income is derived from funded and landed property, and the annual contributions of the Fellows. Each Fellow contributed £4 yearly, or paid a life-composition of £60, with an admission fee of £10; till, recently, a fund was raised to abolish admission fees and reduce the annual contribution to £3. Each Fellow is entitled to the *Philosophical Transactions* and *Proceedings*, and to the use of the library of 30,000 volumes.

The Society formerly undertook the administration of the £1000 annually voted by parliament for scientific purposes, and also assisted in the administration of an additional grant. In 1882 a single grant of £4000 was substituted for the fund and grant of past years. The Society also assists in the naming of the Meteorological Council, which receives a government grant. The President is a trustee of the British Museum. In fulfilment of trusts, the Society award annually, in recognition of scientific work and discoveries, the Copley medal and two Royal medals; the Rumford medal every two years for researches in light or heat; and the Davy medal for chemical investigations.

Some of the most illustrious names in the annals of science appear on the roll of presidents of the Royal Society.

ROYAL SOCIETY (OF EDINBURGH) was incorporated by royal charter in 1783. It owed its origin to Principal Robertson the historian, who successfully labored to found in Edinburgh a Society on the model of the Berlin Academy, for the investigation and discussion of subjects in every branch of science, erudition, and taste. The Society was formally constituted at a meeting held in the College Library on the 23d June 1783, where the subsequent meetings were held till 1810, when the Society purchased a house in George Street. In 1826, the Society removed to its present apartments, leased from government, in the Royal Institution building in Princes Street. The original list of members included the names of most of the literati of Scotland. The first president was Henry Duke of Buccleuch. He was succeeded in 1812 by Sir James Hall, who, resigning in 1820, was succeeded by Sir Walter Scott. On the death of Sir Walter in 1832, Sir Thomas M'Dougal-Brisbane was appointed president; and was succeeded in 1860 by the Duke of Argyll. In 1864, Sir David Brewster, K.H., became successor to the duke, on whose death, in 1868, Sir R. Christison was elected. In 1873, Sir William Thomson was elected, and was followed by other eminent men.

The meetings of the Society are held on the 1st and 3d Mondays of every month from December to July. The admission fee of resident Fellows is £2, 2s., and the annual contribution is £3, 3s., which, after ten years, is reduced to £2, 2s., and ceases after 25 years' membership. The Society is also assisted by an annual grant of £300 voted by parliament. The papers read before this learned body are published in its *Transactions*, of which about 80 volumes have been published in quarto. Abstracts of the papers

also appear in its *Proceedings*, of which ten volumes have appeared in octavo.

The number of *ordinary* Fellows is upwards of 400; and of *honorary* Fellows, near 60.

The Society has the disposal of some valuable prizes, which are bestowed on the authors of the best communications on scientific and other subjects. These are the Keith Prize, founded by Alexander Keith of Dunnotar; the M'Dougall Brisbane Prize, founded by Sir Thomas M. Brisbane; and the Neill Prize, founded by Patrick Neill, Esq., LL.D.

ROYER-COLLARD, PIERRE-PAUL, a French statesman, born 21st June 1768, at Sompuis (Marne). The childhood of R. was spent at his father's house, under the severe surveillance of his mother, who belonged to a family ardently devoted to Jansenism. He was sent to college at Chaumont, and afterwards at Saint-Omer, which was superintended by one of his uncles, the Abbé Collard. Having passed as advocate at an early age, he pleaded several times before the old parliament; but from the first days of the Revolution he was involved in the events of that time, having been elected one of the representatives of the commune of Paris. From 1790 to 1792, he acted as joint-secretary of the municipality. It was then that he was connected with Pétion and Danton. The events of the 31st May obliged him to remove from Paris. He then returned to Sompuis, and lived in obscurity during the whole time of the Reign of Terror, studying and following the plough himself, to evade the suspicions of the Jacobins. Three years afterwards, in 1797, the electors of this department chose him to represent them in the Council of the Five Hundred. R. took an active part in the work of that assembly. He was one of those honest men who, preferring monarchy, but fearing a violent counter-revolution, consented to try the republic with a moderate government, cherishing the hope, in the meantime, of an ultimate restoration.

The 18th Fructidor completely opened his eyes and dispelled his illusions. It was then that he turned his thoughts to what he believed to be the only hope of France, and that he began a correspondence with Louis XVIII., which, however, ceased towards the epoch of the establishment of the Empire. For some years afterwards, he ceased to have anything to do with politics, and entered on another career. He was offered the chair of Philosophy (1809) by Napoleon, in the recently created University of France, which he accepted after great hesitation. Applying himself vigorously to study for it, he was soon highly qualified to fulfil his duties. In the few years he occupied this chair, he exercised an immense influence on the philosophy of France. Rejecting the purely sensuous system of Condillac, he proceeded eclectically, giving special prominence to the principles of the Scottish school of Reid and Stewart. He originated the 'Doctrinaire' school, of which Jouffroy and Cousin were the chief representatives.

The Restoration deprived the cause of education of the services of Royer-Collard. The Bourbons did not overlook the man who had not ceased, since 1798, to maintain their cause; but R., who had all along dreamed of the union of hereditary monarchy with an enlightened liberty, was ill fitted to act with the royalist fanatics now dominant in France.

R. was appointed President of the Commission of Public Instruction (15th August 1815), which office he held, with the title of Councillor of State, till July 1820. He gave in his resignation at that time, not wishing to associate himself with the politics of the ministry. In 1815, the electors of Marne chose him to represent them in the famous 'Chambre Introuvable' (q. v.). He took part in all the business of the Chamber, remaining steadfastly attached to the king, but energetically opposing the *ultra* party. In the next parliament, he rejected, with great energy, the idea of confiding public instruction to the clergy. 'The university', he exclaimed, 'has the monopoly of education, nearly as much as the courts have that of justice, and the army that of the public force.'

At the end of the session 1817, R. for the first time, withdrew from the government, at least from the course pursued by the ministry. He once more supported it in a new discussion against the predominance of the Catholic Church; but dating from 1819, the rupture was complete. He presented then the singular spectacle of a devoted royalist seconding the efforts of the Liberals. The French Academy opened its doors to him in 1827; and in 1828, he was named President of the Chamber of Representatives. As president, R. had to present the famous address of the 221 deputies (March, 1830) refusing their support to the government, which the king refused to hear read. Next day, the Chamber was prorogued. R. departed for Châteauneuf, his country-seat, where he went to conceal fears and regrets which the revolution of July was to justify. He was re-elected in June, 1830, and he accepted this mandate. In 1842, he withdrew from parliamentary life, and after that lived in great seclusion.

Although R. had a considerable fortune, he never departed

from the greatest simplicity, excepting for three things—the purchase of books, charity, and the receptions which his official position imposed on him. He received with politeness, but with a certain coldness which he could never lay aside. His salon was very much frequented by the political world. Every Sunday, the principal leaders of the moderate opposition assembled there: it was a large room, serving as a study, the walls of which were hidden from top to bottom by shelves loaded with books; not a single ornament—no fine furniture—what was strictly necessary, and no more. There assembled Cousin, the most eminent of his pupils; Guizot, the Duke de Broglie, Casimir Périer, De Barante, Villemain, Ampère, Andral, De Rémusat, De Barthélemy, Gabriel, and many others. There was little conversation, properly so called; the slow and sonorous voice of R. was dominant in the room. The subjects were almost always the political events and the debates in parliament; the acts of the government were not spared. This salon was the echo of the Liberal world.

From 1842, R. had completely withdrawn from public life, his health, in fact, not allowing him to occupy himself with public matters. He spent only the winter in Paris, returning in summer to his estate of Châteauneuf, where he died 4th September 1845.

R. is undoubtedly one of the most noted men of the 19th century. He exercised on his contemporaries a powerful influence, owing more, perhaps, to the uprightness, firmness, and extreme earnestness of his character, than to intellectual power or genius. Excepting his political speeches, published in the *Moniteur*, R. left few published works. A lecture on External Perception appeared in 1813; some of his minor articles are given in Jouffroy's translation of Reid. See the biographies by Philippe (1857), and Barante (new ed. 1878).

RSHEW, or RJEV, a town of European Russia, in the government of Tver, and 80 miles south-west from Tver, on the Volga, which passes through it. It is a place of much commerce, has salt and corn magazines, and two great annual fairs. Pop. (1880) 18,732.

RUATA'N, or RATTAN, an island situated in the Bay of Honduras, in the Caribbean Sea, in lat. 16° 30' N., long. 86° 30' W. It is 30 miles long by 9 broad in its widest part; and its dependencies are Bonaca, Utilla, Helena, Barbarette, and Morat. The whole comprise the colony of the Bay Islands, and were formerly part of the British dominions, but they were surrendered in 1860 to the republican government of Honduras. The island has a fine climate, with a prolific soil. The population, estimated at about 2000 souls, of whom about 200 are whites, including nearly 100 Spaniards, are principally emigrants from the Caymans.

RUBA'SSE, a mineral much prized for ornamental uses, is rock crystal, limpid or slightly amethystine, filled internally with minute brown spangles of specular iron, which reflect a bright red, equal to that of the most brilliant ruby. There is an artificial R., made by heating very pure rock crystal red hot, and repeatedly plunging it into a colored liquid.

RUBA'TO, TEMPO (Ital. stolen time), in Music, a capricious style of performance in which some notes are prolonged beyond their legitimate time, while others are curtailed, the aggregate value of the bar remaining unaltered. It is a style of performance which is very apt to be abused by inferior players and singers.

RUBBLE, a common kind of masonry, in which the stones are irregular in size and shape. Walls faced with ashlar are generally packed with rubble at the back. Rubble is of various kinds, according to the amount of dressing given to the stones. Common rubble is built with stones left almost as they come from the quarry. Hammer-dressed rubble is so called when the stones are squared with the mason's hammer; coursed rubble, when the stones are squared and equal in height, &c.

RUBEFACIENTS are external agents employed in medicine for the purpose of stimulating, and consequently reddening, the part to which they are applied. All agents which, after a certain period act as blisters, may be made to act as rubefacients, if their time of action is shortened. The mildest rubefacients are hot poultices, cloths soaked in very hot water, moderately stimulating liniments—as, for example, soap-liniment, with various proportions of liniment of ammonia, or chloroform, &c. Spanish fly, in the form of *Emplastrum Calificiens*, or warm plaster, in which the active ingredient is blunted by the free admixture of soap-plaster, resin-plaster, &c., is a good form of this class of agents. Capsicum or Cayenne pepper, in the form of a poultice, is an excellent rubefacient; it is much used in the West Indies, but is seldom employed in this country. Mustard, in the form *Cataplasma Sinapis*, or mustard poultice, and oil of turpentine, are perhaps the best of the ordinary rubefacients. The former is applied to the soles of the feet and the calves of the legs in the low stage of typhus fever, in apoplexy and coma, in narcotic

poisoning, &c. It is also applied to the chest, with much advantage, in many cases of pulmonary and cardiac disease, and to the surface of the abdomen in various affections, of the abdominal viscera. The best method of employing turpentine is to sprinkle it freely on three or four folds of clean flannel, wrung out of boiling water. The sprinkled surface of this pad is placed upon the skin, and a warm dry towel is laid over the flannel. Two or three such applications will produce a powerful rubefacient effect. Turpentine thus applied is serviceable in all the cases mentioned in the remarks on Mustard, as well as in sore throat, chronic rheumatism, neuralgia, &c.

RUBENS, PETER PAUL, one of the greatest of Flemish painters, was born probably at Siegen, in Westphalia, 29th June 1577. His parents settled in Cologne in 1578, where they remained till 1587, when R.'s father died, and his mother removed with her family to Antwerp. He was first placed under Verhaaght, a landscape painter; however, inclining more to historical painting, he became a pupil of Van Noort, but soon quitted his school for that of Otto Van Veen, or Venius, who then enjoyed a high reputation; and after studying four years with that painter, went to Italy in 1600. Recommended to Vincenzo Gonzago, Duke of Mantua, he was sent on a mission by the duke to Philip III. of Spain, and on that occasion painted several portraits of Spanish noblemen. He also spent a considerable time at Venice and Rome making copies for the duke, and executing independent works, which added largely to his reputation. In 1608, after an absence of eight years, R. returned to Antwerp on account of the illness of his mother, but she died before he had accomplished the journey. He intended to return to Mantua, but was induced to remain by the Archduke Albert, governor of the Netherlands. In 1621, he visited Paris by invitation of Maria de' Medici; and in 1625, completed the series of sketches for the pictures destined to adorn the palace of the Luxembourg. R. was sent by the Infanta Isabella, widow of the Archduke Albert, on a diplomatic mission to Philip IV. of Spain, in 1628; and in the following year, on a similar mission to Charles I. of England, by whom he was knighted in 1630. R.'s success as a political diplomatist is worth noting, and seems to indicate a large, solid, and practical nature, such as painters in general do not possess. He died, very rich, in 1640. R. is the acknowledged head of the Flemish school.

By the expression of powerful and energetic action, and strongly marked character—by great breadth and brilliant coloring, he successfully embodied the tendencies of the age in which he lived, to pleasures of sense, strong passion, and stirring action; and while admitting the coarseness, and almost grossness of his subjects, especially where the nude figure is introduced, we are in a manner carried away by the spirit of joyousness and an animal vigor conspicuous in his works, and the truthful manner in which he viewed nature. His portraits rank with the highest efforts in that walk of art. He painted animals admirably; and his landscapes possess great brilliancy and natural effect. He was perhaps the greatest master in the mechanical part of the art. His style has had great influence on the English school. The tercentenary of R.'s birth was celebrated at Antwerp in 1877 with great enthusiasm and with elaborate and splendid festivities.

RUBE'OLA. See MEASLES.

RUBIA'CEÆ, a natural order of exogenous plants, in which, according to many botanists, the *Cinchonaceæ* are included as a suborder; but which, as restricted by others (*Stellata* of Ray, *Galiaceæ* of Lindley), consists entirely of herbaceous plants, with whorled leaves, angular stems, and numerous very small flowers; the calyx superior, with 4, 5, or 6 lobes, or almost wanting; the corolla wheel-shaped, or tubular, regular, inserted into the calyx, and with the same number of divisions as the calyx; the stamens equal in number with the lobes of the corolla; two styles; the fruit a dry pericarp with two cells, and one seed in each cell. There are between 300 and 400 known species, chiefly abounding in the northern parts of the northern hemisphere, and on the mountains of tropical regions. The most important plant of the order is Madder (q. v.). To this order belong also Bedstraw (q. v.) and Woodruff (q. v.).

RUB'ICON, a stream of Central Italy, falling into the Adriatic, has obtained a proverbial celebrity from the well-known story of its passage by Cæsar, who, by crossing this river—which, at the outbreak of the civil war between him and Pompey, formed the southern boundary of his province—virtually declared war against the Republic. Hence the phrase, 'to cross the Rubicon,' has come to mean, to take an irrevocable step. The modern Luso, called by the peasants on its banks *Il Rubicone*, has claims to being the ancient R.; but arguments preponderate in favor of the *Fluvicino*.

RUBI'DIUM (sym. Rb, eq. 85.4) and CÆSIUM (sym. Cs, eq. 133) are two alkaline metals, discovered in 1860—1861, by Bunsen and Kirchhoff, by means of spectrum analysis. They resemble potassium more nearly than any other substance, and their names are derived from *rubidus*, dark red, and *cæsius*, sky-colored, in

consequence of two red lines of remarkably low refrangibility being present in the spectrum of the former, and two characteristic blue lines in that of the latter. They are widely diffused in nature, but always occur in very small quantities. They have been detected in many mineral waters, and in certain minerals; as, for example, lithia-mica, lepidolite, petolite, and felspar; and they have been found in the alkaline ashes of the beet-root. The best material for the preparation of R. is lepidolite, which will sometimes yield as much as 0.2 per cent. of the metal, while the principal source of cæsius is the brine of Dürkheim, in which both these metals were originally found; every ton of the water containing about three grains of chloride of cæsius, and rather less than four grains of chloride of rubidium. It has, however, been recently asserted that the mineral *Pollux* contains no less than 84.07 per cent. of oxide of cæsius.

Both metals are so analogous to potassium, that they cannot be distinguished either from it or from one another by reagents, or before the blow-pipe. Like potassium, they form double salts with bichloride of platinum, which are much more insoluble than the corresponding potassium salt; and it is on this property that the separation of these metals from potassium is based. It is unnecessary to enter into any details regarding the compounds of these metals. It is worthy of remark that R. is electro-positive towards potassium, and that cæsius is electro-positive towards R. and potassium, and is thus the most electro-positive of the known elements.

The notice of Cæsius is included in this article, because its recent discovery prevented it from being considered in its proper alphabetical place in the original edition of this work. For the same reason, we may here briefly notice another metal, INDIIUM, discovered by Reich and Richter in the Freiburg arsenical ores. Its most striking property, and that which led to its discovery, is the indigo-blue line which all its compounds (in so far as they have been investigated) show in the spectroscopic. Its eq. is 87—new system 118; its sp. gr. varies from 7.1 to 7.3; its color is between those of tin and silver; it is exceedingly soft and very ductile; and its fusing-point is about that of lead.

RUBRICS (Lat. *rubrica*, from *ruber*, red), in classic use, meant the titles or headings of chapters in certain law-books, and is derived from the red color of the ink in which these titles were written, in order to distinguish them from the text. In mediæval and modern use, the name is restricted to the directions which are found in the service-books of the church, as to the ordering of the several prayers, and the performance of the sometimes complicated ceremonial by which they were accompanied. The same name, together with the usage itself, is retained in the Church of England Prayer-book; and in all these, even where the direction has ceased to be printed in red ink, the name rubric is still retained. Where red ink is not employed, the rubric is distinguished from the text by italics, or some other variety of print. In the Catholic Church, considerable controversy exists as to whether the rubrics of the missal, the ritual, and the breviary, are to be considered preceptive, or only directive—a question into which it would be out of place to enter. A similar controversy has existed at various times in the English Church. The science of rubrics is with Catholics a special branch of study, the chief authorities on which are Gavanti, Merati, Cavalieri, and other more compendious writers.

RUBRU'QUIS, WILLIAM DE, one of the most distinguished of mediæval travelers, was born early in the 13th c.—probably about 1228. He entered while very young, into the Franciscan order, and being hindered in his favorite scheme of missionary labor in the Holy Land, he was sent by Louis IX. of France into Central Asia, for the purpose of forming an alliance with Sartsch, the son of Batû Khan of Kiptchak, a supposed Christian sovereign, against the infidels who held the Holy Land. Taking Constantinople as the starting point, R., with two companions, also Franciscans, sailed for Soldaia—now Soujac—near Cherson, made his way across the steppes between the Dnieper and the Don, and crossing the latter river, reached, August 2, 1253, the camp of Sartsch who was now discovered not to be a Christian, and by whom they were sent forward to his father Batû. When they reached the encampment of Batû, on the Volga, near its mouth, that prince refused to treat with them, and sent them forward to the Tartar emperor, Mangû Khan, whom they reached on the 27th December. At this rude court they remained for several months, and accompanied it about Easter to Kara-korum, where they found a few Europeans. Some time afterwards, R., being charged with having spoken of the emperor as an infidel, although he defended himself courageously, was compelled to return, but was treated with a certain degree of rude consideration. Proceeding along the banks of the Volga, he penetrated the difficult defiles of the Caucasus, proceeded through Armenia, Persia, and Asia Minor, to Syria, arriving at Tripoli in August 1255, having spent two years and a half in his eastern travel.

As King Louis, by whom the mission had been accredited, had

meanwhile returned to France, R. requested permission to follow him, in order to report the result; but fortunately for science, the Franciscan provincial refused to permit him to leave the East, and directed him to report in writing. To this fortunate severity we owe the interesting and curious account which he drew up, and of which a brief summary will be found in Lardner's *Cyclopædia, Inland and Maritime Discovery*, vol. i. p. 261, and following. Of the later history of R., the only fact known is, that he was still living in 1293, when Marco Polo was returning from the East. His narrative is among the most plain and sober in its tone of all that have come down to us from the adventurous voyagers of the 13th century.

RUBUS, a genus of plants of the natural order *Rosaceæ*, sub-order *Potentilleæ*, distinguished by a 5-lobed calyx without bracts, and the fruit formed by an aggregation of small drupes adhering to each other upon a long *torus*. The fruit is eatable in all, or almost all, the species, which are very numerous, and natives chiefly of the colder parts of the northern hemisphere, although some are natives of warm climates, and are occasionally to be seen in our hothouses. Some of them are herbs with perennial roots, some are shrubs with subliguous—often only biennial—stems, and they have digitate, pinnate, or lobed leaves. They cause great difficulty to botanists, the varieties being extremely numerous, and the specific distinctions very uncertain. The **RASPBERRY** (q. v.) and **BRAMBLE** (q. v.) are well-known fruits. The **CLODBERRY** (q. v.) also belongs to this genus. Besides these, and the species most nearly resembling them, and which have been described along with them, notice may be taken of *R. spectabilis*, a shrubby species, with leaves of three leaflets, and fine large dark purple fragrant flowers, produced singly on long terminal flower-stalks, a native of the banks of the Columbia River.

The fruit is about the size of a raspberry, dark yellow, acid, and somewhat astringent, making excellent tarts.—*R. saxatilis*, sometimes called the *Stone Bramble*, is a perennial herbaceous plant, with slender stem, leaves of three leaflets, small greenish-yellow flowers, and pleasant fruit of very few rather large drupes. It is a native of stony places, in mountainous parts of Britain.—*R. arcticus* is a small herbaceous plant with creeping roots, slender stems 2–6 inches high, each with three or four leaves, which have three leaflets; the flowers large and of deep rose color, and a purplish red fruit of exquisite flavor. This interesting plant is a very doubtful native of the Highlands of Scotland, but is very abundant in Norway and Sweden, Siberia, and other arctic countries. In Siberia, it is known by a name signifying *Prince-berry*. A syrup, a jelly, and a wine are made of it. The fruit is highly esteemed; but although the plant grows very well in our gardens, it seldom bears fruit.

RUBY, a gem much prized, and only inferior in value to the diamond, or perhaps also to the sapphire. It is regarded by mineralogists not as a distinct species, but as a mere red-colored variety of Sapphire (q. v.) or of Spinel. The *Balas R.* is rose-red. The *Almandine R.* is tinged with violet or brown. The finest red rubies are generally known as *oriental rubies*, and are indeed brought from the East, chiefly from Ceylon and the Burman empire. The best generally come from the neighborhood of Syrlam, in Pegu. In Ceylon, rubies are found in remarkable abundance in alluvial deposits, which have been searched for them for ages, whilst the natives seem never to have thought of digging in the rock of the mountains; but Dr. Gyax found innumerable small rubies, in a state of decomposition, falling to powder, in a stratum of gray granite with iron pyrites and molybdenum; and Sir James E. Tennent thinks that mines might be opened with confidence of success.

Sir Alexander Burnes describes a ruby-mine at Badakshan, in Bactria. Tavernier states that the throne of the Great Mogul was adorned with 108 rubies, of from 100 to 200 carats each. The king of Arracan is said to have possessed a R., in the form of a six-sided prism, about an inch in diameter, terminated by a six-sided pyramid. But the greatest R. ever heard of was that possessed by the king of Ceylon, which, according to Marco Polo, was a span in length, as thick as a man's arm, and without a flaw. Kublai Khan sent an ambassador to demand this R., offering the value of a city as its price; but the Ceylonese monarch refused to sell it. What has become of it is not known.

RÜCKERT, FRIEDRICH, a German lyric poet, was born May 18, 1789, at Schweinfurt, and died in January 1866. He received his education at the gymnasium of his native town, and studied at Jena University. In 1826, he was nominated Professor of Oriental Languages at Erlangen; went in 1840 to Berlin, as professor and privy-councillor, but resigned that position in 1849, and lived on his estate of Nenses in Coburg. R. began his literary career under the pseudonym of *Freimund Raimar* with his *Deutsche Gedichte* (German Poems, Heidelberg, 1814); and *Napoleon, eine politische Komödie in drei Stücken* (Napoleon, a Political Comedy in three Parts, Stuttgart, 1816). Under his own name he published: *Kranz der Zeit* (A Wreath of the Time, Stuttgart, 1817); *Oestliche*

Rosen (Eastern Roses, Leip. 1822); *Gesammelte Gedichte* (Collected Poems, 6 vols., Erl. 1834–1838).

As fruits of his oriental studies are to be considered his translations of Hariri's *Makamen*, under the title *Die Verwandelungen des Abu-Seid* (The Transformations of Abu-Seid, 2 vols. Stuttg. 1826); of the Indian tale, *Nal und Demajanti* (Frank. 1828); *Hamasa, oder die Aelteste Arabische Volkslieder* (Hamasa, or the oldest Arabic Ballads, 2 vols. Stuttg. 1846), and *Amrillkais der Dichter und König* (Amrillkais, the Poet and the King, Stuttg. 1847). Original poems of R., also relating to the East, are: *Morgenland, Sagen und Geschichten* (Eastern Tales and Stories, 2 vols. Stuttg. 1837); *Erbauliches und Beschauliches aus dem Morgenland* (2 vols. Berl. 1837); *Rostem und Suhrub* (Erl. 1838); *Brahmansche Erzählungen* (Brahmanic Tales, Leip. 1839); *Die Weisheit des Brahmanen, ein Lehrgedicht in Bruchstücken* (The Wisdom of the Brahman, a Didactic Poem in Fragments, 6 vols. Leip. 1836–1839); *Leben Jesu* (The Life of Jesus, Stuttg. and Tüb. 1839). The titles of his dramas are: *Saul und David* (Erl. 1843); *Herodes der Grosse* (2 vols. Stuttg. 1844); *Kaiser Heinrich IV.* (2 vols. Frank. 1845); *Cristoforo Colombo* (2 vols. Frank. 1845). R. was one of the most learned, versatile, and sprightly lyrists of modern times. He tried all sorts of metres, the Greek hendecasyllabic, the old Norse alliterative verse, the old German couplet, the *Nibelungen* strophe, the popular ballad, the delicate yet stately measure of the eastern gazelle (sonnets), and every kind of European quatrains, distiches, &c.; and he succeeded in all. Perhaps his fancy and wit were more remarkable than his depth of lyric feeling, yet the simple pathos of such pieces as the *Aus der Jugendzeit* could hardly be surpassed.

RUDD. See **RED-EYE**.

RUDDER, in a ship or boat, is that part of the steering apparatus which is in immediate contact with the water. It is shaped as at A (fig. 1), hung to the stern-post by pintle and brace hinges (fig. 2), and the upper end passing into the vessel, is acted on by the tiller. So long as the rudder, AB (fig. 3), is in a straight line

Fig. 1.

Fig. 2.—A, brace; B, pintle.

Fig. 3.

with the keel, the water which glides past the vessel acts equally on both sides, producing equilibrium; but if the rudder be turned, as AB', it will be relieved from the pressure on the side DC, while that on the side DE will act with greater force, and cause the ship to revolve round the center of gravity, G. When the head has turned sufficiently, as to D', the rudder is again put in line with the keel. See **HELM**.

RUDDIMAN, THOMAS, the greatest of Scottish grammarians, was born in Bauffshire, at a place called Ragel, in the parish of Boyndie, October 1674. He received the rudiments of his classical education at the parish school, where he already gave promise of his future proficiency. At 16 years of age, he went to King's College, Aberdeen, where he took his degree of M.A. four years later.

On leaving the university, he was engaged as tutor in a private family, in which capacity he remained a year, and thereafter became parish schoolmaster of Laurencekirk. Here he accidentally made the acquaintance of the celebrated physician and Latinist, Dr. Archibald Pitcairne, who was so impressed with R.'s learning and sagacity, that he exerted his influence, and succeeded in getting him appointed assistant-keeper of the Advocates' Library, Edinburgh. His new office gave him ample opportunity for prosecuting his favorite studies, but the remuneration was so small, that, in 1707, he was compelled to commence business as an auctioneer. It was at this time that he began his career as an editor by publishing an edition of Volusenus's (Florence Wilson's) *Dialogue on the Tranquillity of the Mind*, to which he prefixed a life of the author. In 1709, he published Arthur Johnston's *Poetical Paraphrase of the Song of Solomon*, and the same author's *Canonica*—both in Latin. In 1714 appeared his well-known work—by which his name will always be honorably perpetuated among Scotchmen—*Rudiments of the Latin Tongue*, a text-book from which, under a great variety of forms, his countrymen still continue to be initiated into classical literature. In 1715, he published

his great edition of Buchanan's works (2 vols. folio); and in that year, exchanged the calling of an auctioneer for the more congenial one of a printer. In this capacity he was assisted by his brother, who became his partner, and had been originally bred to the business. Some years afterwards, he was appointed printer to the university of Edinburgh.

In 1725, he published the first part of his great grammatical work, his *Grammatica Latina Institutiones*, which is devoted to the Etymology of the language; and in 1732, the second part which treats of the Syntax. His philological reputation rests mainly on this work, which has been re-edited in Germany by Stallbaum, and is repeatedly referred to in the Latin Lexicon of Freund. He also prepared an elaborate treatise on Prosody, of which, however, he published only an abridgment. His next appointment was that of principal keeper of the Advocates' Library. While in this post, he completed Anderson's magnificent *Diplomata et Numismata Scotiæ* (folio, 1739), writing the learned Latin introduction, and supplying appendices. Controversy with men such as Benson, who contrasted the Latin verse of Johnston unfavorably with that of Buchanan, and with Logan on the hereditary right of the kings of Scotland to the crown, consumed a great part of his time, but did not so pre-occupy his thoughts as to prevent him from publishing, in 1751, an edition of Livy in 4 vols. 12mo, a gem of typography, and still known as the 'immaculate' edition, from its entire exemption from errors of the press. R. died in Edinburgh, January 19, 1757, in his 83d year. In politics, he was, like his friend Pitcairne, an ardent Tory and Jacobite; and in private life, a most upright and estimable man. Besides the publications already noted, he edited the translation of Virgil's *Æneid* by Bishop Gawain Douglas, and appended a very valuable glossary (folio, 1710). He also founded the *Caledonian Mercury* newspaper, and published or edited a multitude of minor tracts and books. His life has been written by George Chalmers, the antiquary (1 vol. 8vo., 1794).

RUDENTURE, the moulding, in form like a rope or staff, filling the flutings of columns, usually one-third of the height. It is sometimes plain, and sometimes ornamental.

RÜ'DESHEIM, a small town of Prussia, in Hesse-Nassau, on the right bank of the Rhine, opposite Bingen, and 16 miles west of Mainz. In the vicinity is grown one of the most aromatic and fiery of the Rhine-wines (q. v.) called the *Rüdesheimer*; about 650 casks are produced yearly. Pop. 2500.

RUDOLF, or **RODOLF**, of Hapsburg, the founder of the imperial dynasty of Austria, which for a time was that of Germany, was born in 1218, and was the son of Albert Count of Hapsburg and Hedwig of Kyburg-Züringen. R. early exhibited great personal daring and military skill, and acquired celebrity in his native canton of Aargau for the prowess and ability with which he repulsed the many bands of banditti who infested the district. The death, in 1264, of his uncle, Hartmann of Kyburg, to whose rich heritage he succeeded, raised him from the condition of a poor noble to the rank of an influential lord of extended territories, which included the greater part of Aargau, and various domains in the cantons of Bern, Lucerne, Zug, and Zürich. The able manner in which he governed these dominions, and exercised the functions of Protector of the Waldstätter or Forest Cantons, attracted the notice of some of the great electoral princes of Germany; and on the death of the Emperor Albert in 1273, R. was elected his successor, chiefly through the instrumentality of his powerful friend, the Archbishop of Mainz.

The ratification by Pope Gregory XI. of R.'s title was obtained at the cost of various concessions, as for instance, the renunciation of all jurisdiction in Rome, and of all feudal superiority over Spoleto and the Marches of Ancona; together with the cession of all right on the part of the emperor and his successors to interfere in ecclesiastical elections, or in the internal administration and management of the German Church. By this agreement, the feuds were appeased which had existed for nearly 200 years between the empire and the see of Rome, and R. was able to turn his attention to the settlement of the internal disturbances of Germany. His chief enemy was Ottocar, king of Bohemia, under whom he had once served against the Prussians and Hungarians, and who now refused to do homage to him. Fortune, however, favored R. in the war with the Bohemian king, who, after a first defeat, again rose in arms against the empire, but was ultimately defeated and killed in battle (1278), when the emperor seized all the Austrian territories which Ottocar had possessed. Wenceslaus, the son of the slain king, having lost no time in tendering homage for the kingdoms of Bohemia and Moravia, the cause of the war was at an end, and peace being restored, R. thenceforth devoted himself to the organization of the state. His great merit was in breaking the arbitrary power of the nobles, by compelling them to demolish the fortresses and strongholds, by means of which they carried on plundering expeditions against one another, and defended themselves from the power of the law; and we are told that in one year he con-

demned to death 30 refractory nobles, who had long disturbed the public peace, and razed to the ground double that number of strongholds. He also granted charters to many trading towns and municipalities, and thus gave considerable impetus to trade. The policy of his rule generally was indeed so greatly to favor the burgher and working classes, and to repress the tyranny of the powerful nobles, that his reign presented in this respect a favorable contrast to those of his predecessors, and the respect in which he was held by all ranks, bears the strongest testimony to his admirable qualities as a ruler. R. died in 1291, and was succeeded in Austria by his son, Albert I., Duke of Austria. See Schönhuth, Huber, Lorenz; also Hirn, *R. von Habsburg* (1874).

RUDOLF or **RODOLF** II., eldest son of the Emperor Maximilian II. of Germany, was born in 1552, and educated at the Spanish court by the Jesuits. On the death of his father in 1576, he succeeded to the imperial crown, after having, during the lifetime of his father, been proclaimed king of the Romans. This first reigning namesake of the great progenitor of the Austrian dynasty did not add to the dignity or greatness of the Hapsburg family; and the whole of his reign of 36 years was marked by persecutions and intolerance on his side, and by discontent and even insurrection on that of his subjects. His bigotry and intolerance in forbidding Protestants the free exercise of their religion, led them to ally themselves with their co-religionists in the Low Lands and in France (1608), and by implicating the empire in foreign wars, augmented taxation, and increased the monetary difficulties of the state. R., who was gloomy, taciturn, and bigoted, had not the qualities necessary to secure the good-will of those around him, and he died, unregretted by his subjects, 20th January 1612, leaving no issue, and bequeathing to his brother Matthias, who succeeded him, an impoverished and distracted state. R.'s taste for astrology and the occult sciences, and his anxious desire to discover the philosopher's stone, led him to extend his patronage to Kepler and Tycho Brahe, whose study of astronomy was thought specially to qualify them for that much-coveted discovery; and the patronage which R. extended to the Danish discoverer, when the latter was obliged to leave his own country, through the jealousy of his brother-nobles, has proved one of the few claims possessed by R. to the grateful remembrance of late times. The important astronomical calculations begun by Tycho, and continued by Kepler, which are known as *The Rudolphine Tables*, derive their name from this emperor, who originally undertook, but subsequently failed, for want of means, to defray the expenses incidental to the undertaking. See Gindely, *R. II. und Seine Zeit* (1865).

RUDOLSTADT, the chief town of the principality of Schwarzburg-Rudolstadt, is charmingly situated in a hill-girt valley, on the left bank of the Saale, 18 miles south of Weimar. Pop. (1875) 7638.

RUDRA is, in Vedic Mythology, a collective name of the gods of the tempest, or Maruts, Rudra (in the singular) being the name of their father. (See John Muir's *Contributions to a Knowledge of the Vedic Theogony and Mythology*, in the *Journal of the Royal Asiatic Society*, new series, vol. i. part 4, London, 1864.) In later and Puranic mythology (see **HINDU RELIGION and PURANA**), Rudra (the terrible) is a name of S'iva, and the Rudras are his offspring. 'From Brahmā's forehead,' the *Vishṇu-Purāṇa* relates, 'darkened with angry frowns, sprang Rudra, radiant as the noontide sun, fierce and of vast bulk, and of a figure which was half male, half female. "Separate yourself," Brahmā said to him, and having so spoken, disappeared: obedient to which command, Rudra became twofold, disjoining his male and female natures. This male being he again divided into eleven persons, of whom some were agreeable, some hideous, some fierce, some mild; and he multiplied his female nature manifold, of complexions black or white.' See Wilson's *Vishṇu-Purāṇa*.—The word *rudra* apparently comes from the Sanscrit *rud*, weep; but as the sense of this radical does not yield any satisfactory clue to the meaning of the deity called Rudra, the *Purāṇas* invented a legend, according to which Rudra received this name from Brahmā, because, when a youth, he ran about crying aloud; and when asked by Brahmā why he wept, replied that he wanted a name. 'Rudra be thy name,' rejoined Brahmā: he composed; desist from tears. In this legendary etymology there is, moreover, a punning on the similarity between *rud*, cry, and *dru*, run—an illustration of one of the sources whence the later mythology of India derived some of its boundless stock of absurd myths.

RUE (*Ruta*), a genus of plants, of the natural order *Rutaceæ*, having a short 4—5-parted calyx, 4 or 5 concave petals, affixed by a claw, 8 or 10 stamens, and a 4—5-lobed germen, with 8 or 10 nectariferous pores at the base. The species are natives of the south of Europe, the north of Africa, the Canary Isles, and the temperate parts of Asia. They are half shrubby; and have alternate, stalked, repeatedly pinnate leaves with translucent dots, the flowers small, and in terminal corymbs. **COMMON R.**, or **GARDEN**

R. (*R. graveolens*), grows in sunny stony places in the countries near the Mediterranean. It has greenish-yellow flowers, and glaucous evergreen leaves with small oblong leaflets, the terminal leaflets obovate. It is not a native of Britain, but is frequently cultivated in gardens. It was formerly called *Herb of Grace* (see *Hamlet*, act iv. scene 5), because it was used for sprinkling the people with holy water. It was in great repute among the ancients, having been hung about the neck as an amulet against witchcraft in the time of Aristotle. It is the *Peganon* of Hippocrates. R. is still employed in medicine as a powerful stimulant, but the leaves must be used fresh, as they lose their virtues by drying. The smell of R., when fresh, is very strong, and to

Common Rue (*Ruta graveolens*).

many very disagreeable; yet the Roman used it much for flavoring food, and it is still so used in some parts of Europe. The leaves chopped small are also eaten with bread and butter as a stomachic, but they must be used sparingly, as they are acrid enough to blister the skin if much handled, and in large doses act as a narcotic poison. All their properties depend on an acrid volatile oil, which is itself used for making *Syrup of Rue*, eight or ten drops of oil to a pint of syrup; and this, in doses of a teaspoonful or two, is found a useful medicine in flatulent colic of children. The expressed juice of R., mixed with water, and employed as a wash, promotes the growth of the hair.—Some of the species found in the north of India resemble Common R. in their properties, and are used for the same purposes.

RUE'LLIA, a genus of plants of the natural order *Acanthaceæ*, natives of tropical and sub-tropical parts of Asia and Australia. Some of them are very beautiful, and are common ornaments of our hothouses. In some parts of China, especially in the province of Che-kiang, and on the mountains to the west of Ning-po, a species of this genus, *R. indigofera*, is much cultivated for the excellent indigo which it yields. It is also a native of Assam, and is cultivated there.—See Fortune's *Residence among the Chinese*.

RUFF (*Machetes pugnax*), the only known species of its genus, is a bird of the family *Scolopacidae*, and like snipes and many others of the family, an inhabitant of marshy places. It is found in most of the northern parts of the world, migrating southwards

Ruff and Reeve (*Machetes pugnax*).

in autumn, and northwards in spring. It is found in England and in Ireland, but not in Scotland, probably because there are few localities in that country suitable to it. In size, the R. is considerably larger than a snipe, and is about a foot in entire length, from the point of the bill to the tip of the tail. The tail is short and pointed. The wings are long and pointed. The legs are long and slender, the *tibia* naked for some distance above the tarsal joint. The bill is straight, rather slender, as long as

the head. The neck of the male is surrounded, in the breeding season, with a *ruff* of numerous long feathers, whence probably the English name. The males are remarkable for diversity of colors, no two specimens being ever similar; but ash-brown prevails, spotted or mottled with black; the head, ruff, and shoulders are black, glossed with purple, and variously barred with chestnut.

The female (the *Reeve*) is mostly ash-brown, with spots of dark-brown, much more uniform in color than the male. Their nest is usually situated on a tussock in a moist, swampy place, and is formed of the coarse grass which surrounds it. The eggs are four in number. The R. is taken for the table in spring, but the young birds taken in autumn are very preferable. They are often fattened after being taken, and are fed on bread and milk with bruised hemp-seed. After being fattened, they are sent to market. They feed readily when quite newly caught, and fight desperately for their food, unless supplied in separate dishes, which is therefore the regular practice of the feeders, who find it also advantageous to keep them in darkened apartments. The R. is gradually becoming scarcer in England, owing to the destruction of its favorite haunts, the fens, by drainage.

RUFFE, or POPE (*Acerina cernua*), a very pretty little fish of the Perch family (*Percidae*), abundant in the lakes, slow rivers, and ditches of many parts of the middle of Europe and of England. It is not found in Scotland. It is never more than

Ruffe or Pope (*Acerina cernua*).

five or six inches long. In shape, it resembles the common perch, but has only a single dorsal fin. The R. is highly esteemed for the table. It is very easily caught, a small red worm being used as bait.

RUFFLE is a low vibrating sound, less loud than a roll, produced by drummers. It is used as a compliment to general officers and at military funerals.

RUGBY, a market-town of England, in the county of Warwick, and 15 miles north-east of the town of that name, is pleasantly situated on a rising ground on the left bank of the Avon, and is reached by five different railways. It derives its importance and celebrity wholly from its grammar-school, founded by Lawrence Sheriff, a London shop keeper, in 1567. The buildings of the school, consisting of a fine Elizabethan quadrangle, with cloisters, and an elegant detached chapel, are of brick, with stone-work round the windows and at the angles and cornices. The chapel contains among other monuments of head-masters, that of the late Dr. Arnold. The school is generally attended by about 500 pupils. The endowment of the school produces about £5000 a year, and it offers 20 exhibitions of values varying from £40 to £80 a year, and tenable for four years. A park of eleven acres is set aside for foot-ball, cricket, and other games. The railways and the school give rise to almost all the trade of the town. Pop. (1881) 9890.

RUGLEY, a market-town in the county of Stafford, on the right bank of the Trent. There are iron-works in the town, and collieries in the vicinity. Pop. (1871) 3375; (1881) 4249.

RÜ'GEN, the largest of the islands of Germany, belongs to Prussia, and lies in the Baltic, off the coast of Pomerania. Greatest length, 33 miles; greatest breadth, 28 miles; area, 360 square miles. Pop. 45,699. It is separated from the mainland, with which at one time it was probably connected, by a strait, about a mile in width. The island is so deeply indented on all sides by the sea, that it seems to be formed of several narrow tongues of land attached to each other, and to which the name of peninsulas has been given. On the peninsula of Jasmund is the precipitous cliff called the Stubbenkammer, the highest point of which (420 feet) is called the King's Seat, because Charles XII. witnessed from this spot a sea-fight between the Swedes and Danes, August 8, 1715. R., which until 1815 had remained Swedish territory, was in that year transferred to Prussia. Hertha Lake, in this island, is believed to be the place where, according to Tacitus, the goddess Hertha (Earth) was worshiped. The soil of the island is productive, cattle are reared, and the fisheries around the island are carried on with profit. The scenery of R., which is everywhere pleasing, and is frequently grotesque and romantic, together with the facilities for sea-bathing, attract numerous vis-

itors. Chief town, Bergen, in the middle of the island, with (1875) 3591 inhabitants.

RUHNKEN, DAVID, born 2d January 1723 at Stolpe, in Pomerania, received his academical education first at the Königsberg gymnasium, where he distinguished himself not only in classical learning, but even in music and drawing, and afterwards at Wittenberg University, where he spent two years in the assiduous study of ancient literature, history, and jurisprudence. He graduated 1743; after which he went to Leyden, where for six years he prosecuted his classical studies under the guidance of Hemsterhuis, and bestowed particular attention on the Greek writers, nearly all of whom he read. He devised a new edition of Plato, collected the scholia of that author, and published an excellent edition of Timæus's *Lexicon Vocum Platoniarum* (Leyd. 1754; re-edited in a much improved form, 1789). He went in 1755 to Paris, where, for a whole year, he examined the MSS. of the Royal Library and of the Library of St. Germain. Hemsterhuis then got him appointed as lector (reader) in the university of Leyden, in which capacity he was the assistant and colleague of his great master. In October 1757, he introduced his series of lectures by a discourse, *De Græcia Artium et Doctrinarum Inventrice* (Leyd. 1767). For four years he discharged the duties of his office with a skill and success that raised him in public esteem, as one of the most learned men in Holland. In 1761, he succeeded Oudendorp in the chair of Eloquence and History. In 1767, he lost his friend and master Hemsterhuis; and in his capacity as rector of the university, delivered a splendid tribute to the deceased in his *Elogium Tiberii Hemsterhusii* (Leyd. 1768). In 1774, he succeeded Gronovius as librarian to the university, which he enriched with a multitude of valuable books and MSS. He died 14th May 1798, and in gratitude to his memory, the city of Leyden purchased his great library, and gave his widow an annuity of 500 florins.

R. will long be remembered as one of the best scholars and critics of the 18th century. His fine taste and sagacity, aided by an astonishing memory and vast learning, enabled him to illustrate the authors of antiquity with wonderful success. He was also a brilliant prælector, for which he was no doubt indebted to the extreme lucidity and grace of his Latin style. A list of his works would occupy much space. In addition to those already noted, we may mention his edition of vol. ii. of Alberti's *Hesychius*; his edition of *Rutilius Lupus*; of *Velleius Paterculus*; of *Muretus*, &c. He contributed to the editions of the classics by other scholars, such as *Ernesti* and *Schweighäuser*, and thereby accumulated a vast amount of valuable material in the shape of correspondence and miscellanea. His life has been written by his famous pupil *Wytenbach* (Leyd. 1799; new and improved edition, Leips. 1822, and *Freiberg*, 1846).

RUHR, a river of Prussia, an affluent of the Rhine, rises about a mile from Winterberg, in the east of Westphalia, and flowing in a west-north-west direction, enters the plain of the Rhine at Mülheim, and joins the great river at Ruhrort, two miles north-west of Duisburg. Entire length 143 miles.

RU'HRORT, a small town of Rhenish Prussia, on the right bank of the Rhine, 63 miles north-east of Aix-la-Chapelle by railway. It has the best harbor on the Lower Rhine, possesses many large ship-building docks, is the seat of an immense coal-trade with Holland—the coal being derived from large beds of the mineral on the banks of the Ruhr—and carries on a large carrying-trade in corn, timber, and wool, and in miscellaneous articles. A large fleet of steamers, with passengers and traffic, ply from R. up to Strasburg, and down to Holland. A railway crosses the Rhine here, and passengers and goods are carried across the river in the carriages, and without being put to the trouble of shifting their seats, by means of a large steamer, the deck of which is fitted with rails. On each side of the river is a tower, 120 feet high, connected with the railway, and furnished with a powerful engine, by means of which the railway carriages are lowered to the water on one side, and lifted to the railway on the other. Pop. (1875) 9058.

'**RULE BRITANNIA**,' one of the national anthems of Great Britain, which has been described by Southey as 'the political hymn of this country as long as she maintains her political power.' Its original appearance was in a masque entitled *Alfred*, the words by James Thomson the poet, and David Mallet, and the music by Dr. Arne, which was performed for the first time on August 1, 1740, before Frederick, Prince of Wales, at his residence at Clefden. The words of the ode are believed to be the composition of Mallet. *Alfred* was altered by Mallet in 1751, when three stanzas of *Rule Britannia* were omitted, and three others, by Lord Bolingbroke, substituted for them; but it is the ode in its original form that has taken root.

RULE NISI, in the English and Irish courts of law, is a technical term denoting the first step in an interlocutory application to the court, such as an application for a new trial. The usual course is for the party who takes the initiative to move, *ex parte*,

for a rule nisi, i. e., an order of the court that something shall be done, unless the opposite party, within a certain time, usually three or six days, show cause, i. e., some good reason why the thing proposed should not be done. When the party obtains a rule nisi, he sends a copy of it to the other party, who must then, at the time appointed, show cause, and if the cause is deemed sufficient, the rule is discharged, i. e., the application is refused; if the cause is insufficient, the rule is made absolute, i. e., the opposite party is bound to do the thing asked, otherwise he will be liable to some disadvantage or to imprisonment, according to the nature of the subject matter.

RULE OF FAITH, the name given in polemical theology to what is regarded as the code from which the faith of Christians is to be drawn. One of the most vital of modern religious controversies is that which turns upon the question: What is the Christian rule of faith? We can but undertake to state the conflicting views. The Reformers, as a body, laid it down as a first principle, that the Word of God alone, by which they meant the written word, or the Scriptures, could safely be accepted as a rule of faith. If the Fathers could be received at all, it is only in the light of witnesses, and fallible witnesses, to the ancient interpretation of the Scriptures. This doctrine appears to be much modified in the English Church of the Laudian period, and by the successors of that school, the modern Tractarians, who admit the 'consent' of the Fathers as an authoritative interpretation of the Scriptures. Roman Catholics, on the contrary, while they admit that God's word alone is the rule of faith, yet contend that the Scriptures are not to be considered as the only depository of God's word. Much of our Lord's teaching to his apostles was not committed to writing in these authentic Scriptures; and as the teaching of Christ, wherever found, is God's word, even as much as what is written in the Scriptures, they hold that if it be possible to find such teaching elsewhere than in the Bible, the teaching so found is to be held as part of the rule of faith. Now they hold that the traditions of the church, contained in the writings of the Fathers, the decrees of councils, the decretals of popes, are a depository of Christ's teaching, less accessible, it is true, but when unanimous, not less certain than the Scripture itself; and of this certainty of such unanimous interpretation, they regard the church as at all times the authoritative expositor.

Protestants acknowledge the authority of the oral teaching of Christ himself, and of his apostles, or others speaking by inspiration; but in respect of the want of any authoritative or trustworthy record, they deny that any such teaching, not recorded in the Scriptures, is of any value to us. As to the right of the church to expound authoritatively, they deny it altogether.

RULE OF THE ROAD. This phrase includes the regulations to be observed in the movements of conveyances either on land or at sea.—*On land*: Drivers and riders keep the side of the road next their left hand when meeting, and that next their right when overtaking and passing other horses or conveyances. The person neglecting this rule is liable for any damage that may happen through such neglect. A man riding against a horse or a conveyance driving against another that is standing still, is answerable for any damage that may ensue.—*At Sea*: Vessels meeting from opposite directions *port their helms* and pass one another on their left sides. A vessel overtaking another shall keep clear of that overtaken. When two sailing-vessels are crossing one another, the one that has the wind on its *port* (left) side has to keep clear of that which has the wind on the *starboard* (right) side, except when the former is *close-hauled*, and the latter free. If they have the wind on the same side, the ship that is to windward must keep clear of that to leeward. A steamer having another on her starboard side has to keep out of its way. Steamers have to keep out of the way of sailing ships, and to slacken speed when nearing other vessels. When one vessel has to get out of the way, the other keeps her course; but safety being the first consideration, these rules are not to be acted upon at all hazards, when their observance incurs obvious risk of danger. The Board of Trade sanctioned some new regulations for ships in 1880. See *De Horsey's Rule of the Road at Sea*.

RULE OF THREE is the technical term for that rule in arithmetic, otherwise called *Proportion* (q. v.), which teaches the finding of a fourth number proportional to *three given numbers*. The term 'rule of three' has been in use from the commencement of the 16th c.; and from the great utility of the operation in commercial transactions, it received, almost from the commencement, the name of the **GOLDEN RULE** (q. v.). To the ordinary 'rule of three' was added the *backer rule*, or 'rule of three inverse' (corresponding to inverse or Reciprocal [q. v.] proportion), and the 'double rule of three, in which two or more ratios are given as determining the number to be found.

RUM, a mountainous island of Argyleshire, belongs to the group of the Inner Hebrides, 15 miles north-north-west of Ardnamurchan Point. It is 8 miles long, about $7\frac{1}{2}$ miles broad; area upwards of 30,000 acres, only about 6 per cent. of which is under

cultivation. Pop. (1851) 162; (1871) 81; (1881) 89. The island is a mass of high sharp-peaked mountains, rising in Ben More to the height of 2320 feet.

RUM, a kind of spirit made by fermenting and distilling the 'sweets' that accrue in making sugar from cane-juice. The scummings from the sugar-pans give the best rum that any particular plantation can produce; scummings and molasses, the next quality; and molasses the lowest. Before fermentation water is added, till the 'sett' or wort is of the strength of about 12 per cent. of sugar; and every ten gallons yields one gallon of rum, or rather more. The flavor of rum depends mainly on soil and climate, and is not good where canes grow rankly. Pine apples and guavas are at times thrown into the still, but on the great scale, no attempt is made to influence flavor artificially. The finest-flavored rums are produced by the old-fashioned small stills. The modern stills, which produce a strong spirit at one operation, are unfavorable to flavor. The color of rum is imparted after distillation by adding a certain proportion (varying with the varying taste of the market) of caramel, or sugar melted without water, and thus slightly charred. Rum is greatly improved by age, and old rum is often very highly prized; at a sale in Carlisle in 1865, rum known to be 140 years old sold for three guineas per bottle. It forms a very important part of our colonial produce: the quantity imported into Britain in 1875 was 8,815,681 gallons; in 1881, 4,816,887 gallons (value £485,685). Rum is distilled both in the E. and W. Indies.

RU'MA, a small town of Austria, in Slavonia, on an affluent of the Save, 35 miles north-west of Belgrade. The chief industry is wine-culture, and the rearing of horses. Pop. (1880) 7800.

RUMA'NIA (often written ROUMANIA). See the article MOLDAVIA AND WALACHIA, to which this short notice serves as a continuation and conclusion. A military revolt took place in February 1866, which resulted in the deposition of Prince Couza—Alexander John I. The Count of Flanders, younger brother of Leopold II. of Belgium, was unanimously chosen Hospodar; but he at once declined the perilous honor. Upon this, the choice of the Rumanians fell upon Prince Charles of Hohenzollern-Sigmaringen, who was proclaimed Prince of R. on April 20, 1866. The existing constitution was then adopted. When war broke out between Russia and Turkey in April 1877, R. signed a convention with Russia, guaranteeing the Russian troops a free passage through Rumanian territory; and on May 21 the Chamber of Deputies at Bucharest decreed the independence of R. War was declared with Turkey; and the Rumanian army bore a creditable part in several battles, especially before Plevna. The Berlin Congress of 1878, which revised the treaty of San Stefano, concluded between Russia and Turkey, and has attempted the most recent solution of the 'Eastern Question,' agreed to recognize the independence of R. It resolved, however, much against the will of the government and people of R., to restore to Russia the portions of Bessarabia (q. v.) touching the Pruth and Danube, which were given by the treaty of Paris to Moldavia in 1856; and, by a rough sort of compensation, R. received the Dobrukscha (q. v.). It was stipulated that religious dissent should not exclude from civil rights. On 27th March 1881, the Senate and Chamber unanimously resolved that R. should be proclaimed a kingdom.

RUMFORD, BENJAMIN THOMPSON, COUNT, an American inventor, was born at Woburn, Massachusetts, March 26, 1753. Having received the rudiments of education at a common school, he entered a merchant's office at Salem, at the age of 13, and got his living as a clerk and school teacher, while he studied medicine and physics. In 1770, he was engaged as teacher of an academy at Rumford, now Concord, the capital of New Hampshire; and in 1772, married a rich widow of that place, and was made major of militia by the English governor. The jealousy of officers over whom he had been promoted, and charges of disaffection to the royal cause, at this period of the outbreak of the American revolution, drove him from Rumford to Boston, where he became acquainted with General Howe; and when General Washington compelled the surrender of Boston, Thompson was sent to England as bearer of dispatches. In London, he so won the favor of the government by his intelligence, as to be appointed Under-secretary of State in the Colonial Office. On a change of ministry, however, he returned to America, and fought in the royal cause. When it failed, he entered the service of the king of Bavaria, by whom he was knighted; and in 1784, he was settled at Munich as aide-de-camp and chamberlain to the reigning sovereign. In this post he exhibited the energy of his mind and the fertility of his invention. He reorganized the army and improved its tactics. In 1790, he suppressed beggary throughout the kingdom, took measures for improving the breeds of horses and cattle, and laid out a park for Munich. He rapidly rose to the offices of major-general, councillor of state, lieutenant-general, minister of war, and was created Count of the Holy Roman Empire, when he chose Rumford, where his fortunes had begun,

as his titular designation. In 1795, he visited London, where he was treated with much attention, and finding that his opinion was sought after on technological subjects, he published the results of his experience and the records of his labors in Bavaria.

Having long and carefully studied the phenomena of heat, he set himself to devise a remedy for the smoky chimneys, which were one of the greatest nuisances at that time in England; and discovered the principles upon which fireplaces and chimneys have since been constructed. Other cases in which greater economy of the application or production of heat could be obtained, as cooking-ranges, stoves, &c., engaged much of his attention. On his return to Bavaria, he was appointed President of the Council of Regency, and soon after, Minister Plenipotentiary to the Court of St. James; but the British government, holding to the doctrine of inalienable allegiance, refused to recognize him in that capacity. He declined an invitation to revisit America, where he was greatly admired, in spite of his loyalty. He finally settled in Paris; devoted himself to improvements in artillery and illumination; founded a professorship, in Harvard College, of the Application of Science to the Arts of Living; married the widow of Lavoisier; and died at Auteuil, near Paris, August 21, 1814, after making many important bequests to the Royal Society of London, the American Academy of Sciences, and Harvard University. See *Memoir* by Ellis (1876).

RU'MILI. See ROUMELIA.

RUMINA'NTIA, a group of animals, in the division *Artiodactyla* (q. v.) of the order of *Ungulata*. Cuvier treated them as a separate order. The R. are an extremely well-defined group, among the individuals of which the habit of *ruminatio* or chewing the cud is universal and almost peculiar. The R. are all strictly and exclusively herbivorous, and exhibit a great similarity of structure. They have no incisors in the upper jaw, the front of which is occupied by a callous pad. 'The grass is collected and rolled together by means of the long and movable tongue; it is firmly held between the lower cutting teeth and the pad, the cartilaginous upper lip assisting in this; and then, by a sudden nodding motion of the head, the little roll of herbage is either torn or cut off, or partly both torn and cut.'—Youatt.

In the lower jaw, there generally appear to be eight incisors; but the two outer are more properly to be regarded as canines, and in the *Camelidae*, they assume the ordinary canine form. Some of the R. have canine teeth in the upper jaw, and some are destitute of them. In front of the molar teeth, there is a long vacant space in both jaws. The molars are six on each side in each jaw; their surface exhibits crescent-shaped ridges of enamel. The head is elongated, the neck is always of considerable length, the eyes are placed at the side of the head, and the senses of smell and hearing, as well as of sight, are extremely acute. The head is in many R. armed with horns, which in some are found in both sexes, in some only in the male, whilst in others they are wholly wanting; and the absence of them characterizes varieties of some species, as the sheep and ox, in which they are ordinarily present. The horns differ very much in different families, even in their structure, some being hollow (true *horns*), some solid (*antlers*). All the four limbs are terminated by two large toes, which are hooved. Behind the hoof are always two small spurs, rudimentary toes. The metacarpal and the metatarsal bones are united into one, called the *cannon* bone. The legs are rather long, and the spinal column is very flexible. The brain of the R. is small, and they do not exhibit much intelligence; nor are they distinguished by any remarkable instincts; and though easily tamed, they are scarcely susceptible of any kind of training or education. Very few, however, of the numerous species of R. have been truly domesticated, and probably much is yet to be done in this way.

The R. are generally gregarious; they are distributed over almost the whole world; but none are natives of Australia. They are found both in the warmest and the coldest regions. The flesh of all the R. is fit to be used for human food; the fat (tallow) hardens more on cooling than the fat of other animals, and even becomes brittle. The fat, hide, horns, hoofs, hair, bones, entrails, blood, and almost all parts are useful to man.

The intestines are long in all the Ruminantia. The *cæcum* is also long. The complex stomach, adapted to rumination, requires a more particular description. The stomach consists of four distinct bags or cavities. The first of these, into which the gullet or *œsophagus* enters, is, in the mature animal, by far the largest, and is called the *Paunch* (Lat. *rumen*). Into this the chief part of the food passes. It is lined with a thick membrane, presenting numerous prominent hard papillæ, secreting a fluid in which the food is soaked. The second cavity is the *Honeycomb Bag* (Lat. *reticulum*), so called from its being internally covered with a network of cells, like those of a honeycomb. In Scotland, it is known as the *King's Hood*. This second cavity, or stomach, has also a direct communication with the *œsophagus*, and fluids seem in gen.

eral to pass immediately into it, but sometimes or partly also into the other cavities; and it is here that the cells for retaining water are chiefly found in the camel. The third cavity, or stomach, is the *Manplies* (Lat. *psalterium*), so called because its lining membrane forms many deep folds, like the leaves of a book, beset with small hard tubercles. This also communicates directly with the œsophagus, by a sort of prolongation of it. The leaves of the membrane seem to serve for the absorption of superfluous fluid from the food. Finally, the food passes into the fourth cavity, which is of a more elongated form than any of the others, and is next in size to the first. This is called the *Reed* or *Rennet* (Lat. *abomasus*). It may be considered as the true stomach, homologous—if any one of the four parts can be so regarded—to the simple stomach of mammals in general. It is lined with a velvety mucous membrane in longitudinal folds. It is here that the gastric juice is secreted. In young animals, it is the largest of the four cavities, and it is only when they pass from milk to crude vegetable food that the paunch becomes enlarged, and all the parts of the complex stomach come fully into use. It seems to be by a power of what may be called instinctive volition, that the animal directs what passes through the gullet into the first cavity, the second, or even the third. It has been found by M. Flourens, who made many experiments on this subject, that the food consumed by ruminants passed chiefly into the first cavity, but part of it also at once into the second, and even, when it was given in a *mashed* or in a much comminuted state, into the third.

The particular means by which hastily swallowed food is brought from the paunch, formed into pellets at the base of the œsophagus, and brought up into the mouth for rumination, or second and more thorough mastication, are not yet very thoroughly understood, notwithstanding the patient investigations of M. Flourens. He ascribes the formation of the pellets, however, to the action of the muscular duct which connects the œsophagus with the second and third stomachs, and the power which the animal has of closing or opening at will the orifices of these cavities.

Chewing of the cud is very generally performed in an attitude of repose, and evidently affords great pleasure to the animal.

The R. are arranged by naturalists in seven families, all very natural—*Camelidæ* (see CAMEL), *Moschidæ* (see MUSK), *Cervidæ* (see DEER), *Cameloparidæ* (see GIRAFFE), *Antelopidæ* (see ANTELOPE), *Bovidæ* (q. v.), and *Capridæ* (q. v.). The most important genera and species are separately noticed.

RUMP PARLIAMENT. In order to bring about the condemnation of Charles I., Oliver Cromwell, on 6th December 1648, sent two regiments, under the command of Colonel Pride, to coerce the House of Commons. Forty-one members of the Long Parliament who were favorable to accommodation were imprisoned in a lower room of the house, 160 were ordered to go home, and only 60 of the most violent of the Independents were admitted. The clearance was called *Pride's Purge*, and the privileged members ever afterwards passed by the name of the *Rump*, forming, as it were, the fag-end of the Long Parliament. This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnation of Charles I. Five years later, the Rump Parliament, forgetting that it was but the creature of the army, attempted to make a stand against certain demands on the part of the soldiers. The result was that Cromwell filled the House with armed men; the Speaker was pulled out of the chair, the mace taken from the table, the room cleared, the door locked, and the parliament declared to be dissolved.

Supreme in the three kingdoms, Cromwell convoked an assembly which assumed the title of Parliament, and acquired from the name of one of its most prominent members, a leather-seller, called Praisegod Barebones, the name of the *Barebones Parliament*. The Barebones Parliament, after subsisting five months, was dissolved, and Cromwell, raised to the dignity of Protector, convoked two parliaments, and dissolved them for refusing to sanction his measures. On Oliver Cromwell's death, and Richard's succession to the Protectorate, the military malcontents coalescing with the Independents in Richard's parliament, declared the expulsion of the Rump illegal, and restored that assembly to its functions. With the revival of the Rump, its quarrel with the army revived; and the troops, again surrounding Westminster Hall, expelled it on 13th October 1659, a provisional government of officers assuming the direction of affairs. But the general dissatisfaction having led to a coalition between the Presbyterians and Royalists, the army, unable to carry on the government, was reduced to the necessity of once more restoring the Rump, which had been twice ignominiously expelled. The advance of Monk, however, with the army of Scotland led to a general cry throughout the country for a free parliament. A number of the members who had been excluded by Pride's Purge reappearing in the House, placed the Independents in the minority; and on 16th March 1660, the despised and derided Rump at last solemnly decreed its own dissolution. The most prominent members of the Rump Parliament were Vane and Hazlerig.

RUM SHRUB, a liqueur in which the alcoholic base is rum, and the other materials are sugar, lime or lemon juice, and the rind of these fruits added to give flavor. Almost every maker has his own receipt, and much credit is assumed by each for his own especial mixture.

RU'NCORN, a thriving market and manufacturing town and river-port of Cheshire, on the left bank of the Mersey, 12 miles south-east of Liverpool. There is a station of the North-western Railway on the Lancashire side of the river, and the town is the terminus for the Bridgewater and the Mersey and Irwell Canals. It is a free port, has a custom-house, and contains iron-foundries, soap and chemical works, ship-building yards, &c.; and in the vicinity are collieries, and slate and freestone quarries, large quantities of freestone are shipped for distant ports. In 1880, 2861 vessels, of 287,000 tons, entered the port. Pop. (1851) 8049; (1871) 12,443; (1881) 15,113.

RUNES, the earliest alphabet in use among the Teutonic and Gothic nations of Northern Europe. The exact period of their origin is not known. The name is derived from the Teutonic *rûn*, a mystery, whence *runa*, a whisper, and *hebrûn*, divination; and the original use of these characters seems to have been for purposes of secrecy and divination. The resemblance which some of the runic characters bear to the Phœnician alphabet and others derived from it, has led to the supposition that they were first introduced by Phœnician merchants who traded with the coasts of the Baltic; and while the mass of the people were allowed to possess but a very partial acquaintance with them, the priests systematized them, and retained a full knowledge of them in their own hands, no doubt finding them useful in establishing a reputation for superior power and intelligence. Scandinavian and Anglo-Saxon tradition agree in ascribing the invention of runic writing to Odin or Wodin. The countries in which traces of the use of runes exist include Denmark, Norway, Sweden, Iceland, Germany, Britain, France, and Spain; and they are found engraved on rocks, crosses, monumental stones, coins, medals, rings, brooches, and the hilts and blades of swords. Runic letters were also often cut on smooth sticks called *rûn-stafas*, or mysterious staves, and used for purposes of divination. But there is no reason to believe that they were at any time in the familiar use in which we find the characters of a written language in modern times, nor have we any traces of their being used in books or on parchment. We have an explanation of the runic alphabet in various MSS. of the early middle ages, prior to the times when runes had altogether ceased to be understood.

The systems of runes in use among the different branches of the Teutonic stock were not identical, though they have a strong general family likeness, showing their community of origin. The letters are arranged in an order altogether distinct from that of any other alphabetical system, and have a purely Teutonic nomenclature. Each letter is, as in the Hebrew-Phœnician, derived from the name of some well-known familiar object, with whose initial letter it corresponds. Runes being associated in the popular belief with augury and divination, were, to a considerable extent, discouraged by the early Christian priests and missionaries, whose efforts were directed to the supplanting of them by Greek and Roman characters. But it was not easy suddenly to put a stop to their use, and we find runes continuing to be employed in early Christian inscriptions. This was to a remarkable extent the case in the Anglo-Saxon kingdoms of Northumbria, Mercia, and East Anglia, where we have traces of runic writing of dates varying from the middle of the 7th to the middle of the 10th century. Its continued prevalence in this particular district has been accounted for by the fact that, after the death of Edwin and the flight of St. Paulinus, the restoration of Christianity in Northumbria was effected by missionaries of the Irish school, whose predecessors had adopted the policy, not, like Augustine and his brethren, of destroying the monuments of pagan antiquity, but of allowing them to remain, and consecrating them by marking them with the symbols of Christianity. Runes are said to have been laid aside in Sweden by the year 1001, and in Spain they were officially condemned by the Council of Toledo in 1115.

The different systems of runes, all accordant up to a certain point, have been classed as the Anglo-Saxon, the German, and the Norse, each containing different subordinate varieties. The Norse alphabet is generally considered the oldest, and the parent of the rest. It has 16 letters corresponding to our *f, u, th, o, r, k, h, n, i, a, s, t, b, l, m, y*, but has no equivalent for various sounds which existed in the language, in consequence of which the sound of *k* was used for *g*, *d* for *t*, *b* for *p*, and *u* and *y* for *v*: *o* was expressed by *au*, and *e* by *ai*, *i*, or *ia*; and the same letter otherwise was made to serve for more than one sound. Other expedients came, in the course of time, to be employed to obviate the deficiency of the system, as the addition of dots, and the adoption of new characters. But the runic system received a fuller development among the Germans and Anglo-Saxons, particularly the latter, whose alphabet was extended to no fewer than forty

characters, in which seem to have been embraced, more nearly than in any modern alphabets, the actual sounds of a language. Till recently the Norse runes had been most studied; but of late the Anglo-Saxon had become the subject of considerable attention. The following table exhibits the best known forms of the Anglo-Saxon, German, and Norse runic alphabets, with the names, and the power of the several letters:

Anglo-Saxon.	German.	Norse.
feoh f	feh	fé
ur u (short)	uur	ur
thorn th	dorn	thurs
os o (short)	oos	os
rad r	rat	ridr
cæn k	cen	kaun
gyfu g	gebo	
wen w	huun	
hægel h	hagal	* hagi
nyd n	nod	naud

vult v		

The Anglo-Saxon runes, as here given, are derived from a variety of MS. authorities, the most complete containing forty characters, while some only extend as far as the twenty-fifth or twenty-eighth letter. Neither the name nor the power of some of the later letters is thoroughly known, and they are without any equivalents in the Norse runic system. The German runes are given from a MS. in the conventual library of St. Gall in Switzerland. Though the various runic alphabets are not alike copious, the same order of succession among the letters is preserved, excepting that, in the Norse alphabet, *laugr* precedes *madr*, although we have placed them otherwise, with the view of exhibiting the correspondence of the three systems. The number of characters in the Anglo-Saxon alphabet is a multiple of the sacred number eight; and we have the evidence both of a Swedish bracteate containing twenty-four characters, and of the above-mentioned St. Gall MS., that there was a recognized divi-

sion of the alphabet into classes of eight letters—a classification which forms the basis of a system of secret runes noticed in that MS. Of these secret runes, there are several varieties specified: in particular 1. *Iis-runa* and *Lago-runa* (of which specimens exist in Scandinavia), consisting of groups of repetitions of the character *iis* or *lago*, some shorter and some longer, the number of shorter characters in each group denoting the class to which the letter intended to be indicated belonged; the number of longer ones, its position in the class. 2. *Hahal-runa*, where the letters are indicated by characters with branching stems, the branches to the left denoting the class, and those to the right the position in that class. There is an inscription in secret runes of this description at Hackness in Yorkshire. 3. *Stof-runa*, in which the class is indicated by points placed above, and the position in the class by points below, or the reverse.

The best known inscriptions in the Anglo-Saxon character are those on two gravestones at Hartlepool in Northumberland, on a cross at Bewcastle in Cumberland, and on another cross at Ruthwell in Dumfriesshire. The inscription on the west side of Bewcastle cross, which we give as a specimen of Anglo-Saxon runes, is a memorial of Alcfrid, son of Oswiu, who was associated with his father in the government of the kingdom of Northumbria, in the 7th century.

Runes.

It has been thus deciphered into the Anglo-Saxon dialect of the period:

+ THIS SIGBECUN
SETTE HWÆTRED
EM GÆRFÆ BOLDU
ÆFTER BARÆ
YMB CYNING ALCFRIDÆ
GICEGÆD HEOSUM SAWLUM.

Or in modern English:

This memorial
Hwætred set
and carved this monument
after the prince
after the king Alcfrid,
pray for their souls.

The inscription on the Ruthwell cross, after being long a puzzle to antiquaries, was first deciphered in 1838 by Mr. John M. Kemble, an eminent Anglo-Saxon scholar. It is written alternately down one side of the stone and up another, and contains a portion of a poem on the subject of the Crucifixion. Mr. Kemble's interpretation received a very satisfactory confirmation by the discovery of a more complete copy of the same poem in a MS. volume of Anglo-Saxon homilies at Vercelli.

Mr. D. H. Haigh, whose researches have added much to our knowledge of Anglo-Saxon runes, has endeavored to set up for them a claim of priority over the Norse characters. Instead of considering the additional Anglo-Saxon letters as a development of the Norse system, he looks on the Norse alphabet of sixteen letters as an abridgment of an earlier system, and finds occasional traces of the existence of the discarded characters in the earliest Norse inscriptions, and in the Scandinavian *Iis-runa* and *Hahal-runa*, where the letters are classified in accordance with the Anglo-Saxon groups of eight.

The Scandinavian kingdoms contain numerous runic monuments, some of them written *boustrophedon*, or with the lines beginning alternately from the right and left, and there are many interesting inscriptions on Swedish gold bracteates, generally having reference to some design which they accompany. The Celtic races, from their connection with the Scandinavians, became acquainted with their alphabet, and made use of it in writing their own language; and hence we have in the Western Islands of Scotland, and in the Isle of Man, runic inscriptions, not in the Anglo-Saxon, but in the Norse character, with, how-

ever, a few peculiarities of their own. Some of the most perfect runic inscriptions are in Man; others of a similar description exist at Holy Island, in Lamash Bay, Arran, and there is an inscription in the same character on a remarkable brooch dug up at Hunterston in Ayrshire. Dr. D. Wilson considers that the Celtic population of Scotland were as familiar with Norse, as the Northumbrians with Saxon runes.

We sometimes find the Norse runes used to denote numerals, in which case the sixteen characters stand for the numbers from 1 to 16; *ar* combined with *laugr* stands for 17, double *maðr* for 18, and double *tyr* for 19. Two or more letters are used to express higher numbers, as *ur ur*, 20; *thurs thurs os*, 34.

See Planta's essay, *On the Runic or Scandinavian Language*; W. C. Grimm, *Ueber Deutsche Runen*; *Archæologia* vol. 28; Haigh's *Anglo-Saxon Conquest of Britain*; Dr. D. Wilson's *Prehistoric Annals of Scotland*; the Danish works of Worsaae and Wimmer.

The term RUNCIC KNOTWORK is often applied loosely and inaccurately to a kind of interlaced ornamentation to be seen in MSS. and on monuments of Anglo-Saxon, Norman, Scandinavian, Scotch-Irish, and Pictish origin, from the 6th to the 12th century.

RUNGPU'R, a British district of India, in the presidency of Bengal, bounded on the E. by the Brahmaputra, and on the N. by the protected state of Cosh Behar. Area, 3476 sq. m.; pop. (1871) 2,149,172. The surface is so low, that a large proportion of it is inundated during the rains. Indigo, for the manufacture of which there are numerous large factories in the district, is the great article of export.

RUNJEET-SINGH, maharajah of the Punjab (generally described by English writers as the *king of Lahore*), was born at Gugaranwalla, 2d November, 1780. His father, Mahia-Singh, was sirdar of Sukur-Chukkeh, one of the twelve missouls or military organizations of the Sikhs, and died when R. was about 12 years old, leaving a full treasury and a well-regulated government. His widow took charge of the administration, and attempted by every means in her power to render her son effeminate, but R.'s character was not capable of being weakened by such treatment. When about 17 years old, his mother died suddenly (poisoned, as it is reported, by her son), and he immediately assumed the government.

R. now showed himself to be a prince of overwhelming ambition, and capable of attaining his object either by policy and address, or by force. In 1799, having rendered important service as an ally to Zemân Shah of Afghanistan, who had invaded the Punjab, he received from that monarch liberty to take possession of Lahore, which he accordingly did, and held it, despite the utmost efforts of his brother sirdars. To these quarrelsome neighbors he next turned his attention, and succeeded in subduing some and rendering others tributary, so that by 1809 he had greatly reduced their number. His successes having alarmed the Sikh chiefs, situated between the Sutlej and the Jumna, they besought the governor-general's interference, and this was the only occasion on which he ever came into collision with the British. Arrangements were amicably made, and Britain gave up all pretension to interference north of the Sutlej, on condition that that boundary should be carefully respected. R., thus freed from the only danger he feared, pursued his schemes of aggrandizement; and in 1812, having compelled all but three of the Punjab sirdars to resign their authority, he organized the whole under one sovereignty, and proclaimed himself *rajah*. His army had for several years previously been organized and disciplined according to the European fashion by English officers who had entered his service, so that the wild and undisciplined troops of the neighboring states had not a chance of successfully opposing him. About this time his capital was resorted to by two of the dispossessed rulers of Afghanistan, one of whom, Shah-Sujah, was the possessor of the celebrated *Koh-i-nûr* (q. v.), which prize R. eagerly coveted, and at last obtained as the price of his assistance in recovering the throne of Cabul. In 1813, R. obtained possession of Attock, took Multan by storm in 1817, and in 1819 annexed Cashmere, assuming after these exploits the title of *maharajah*.

In 1822, he took into his service Allard and Ventura, two French officers who formerly served under Napoleon, and by their aid he finished the reconstruction of his army, with the view of extending his dominion to the west of the Indus. In pursuance of this scheme, he wrested (1829) from the Afghans the province of Peshawur. He had now an extensive territory, peopled by more than 20,000,000, and a well-trained army of 70,000 men, of whom 36,000 were infantry, thoroughly disciplined, and this numerous host was employed for several years in desultory wars with the Afghans. Between him and the British there was always a mutual distrust, dissembled by the show of extreme cordiality; but as both parties scrupulously abstained from any cause of offence, pacific relations were never interrupted. In 1836, his army was totally defeated by the Afghans, but this reverse seems not in the slightest degree to have affected the stability of his

rule, even in the most recently-acquired districts; and, strange to say, his long reign was not disturbed by a single revolt. He died 27th June 1839. R. is one of the most remarkable men in eastern history; in person he was short and slight; his countenance, deeply marked with small-pox (which had deprived him of the sight of one eye), was, however, expressive of strong determination, to which the calm of his brilliant dark eye lent additional effect. He was totally uneducated; could neither read nor write; yet the indefatigable energy of his administration, and his clemency and moderation (rare qualities in an Asiatic despot), are without a parallel in the East. See *English Cyclopædia*; Cuvillier-Fleury, *Notes Historiques sur le Général Allard*; *Revue Britannique*, vols. x., xiii., xxiii., and xxvii.

RUNNER (*flagellum*, a whip), in Botany, is a long slender branch proceeding from a lateral bud of a herbaceous plant with very short axis, or in popular language, without stem. It extends along the ground, and produces buds as it proceeds, which often take root and form new plants. Strawberries afford a familiar example. Another is found in *Potentilla anserina*. Runners are common in the genus *Ranunculus*.

RUNNERS. See KIDNEY BEAN.

RUNNIMEDE, a long stretch of green meadow, lying along the right bank of the Thames, from which it is partly concealed by plantations of willows, 20 miles west-south-west of London. It is proposed to derive the name from the Sax. *rhynes*, water-brooks, which abound in these meadows; others suppose the word to be *Runningmead*, referring to the horse-races which appear to have been held here from time immemorial, and which still take place in the month of August. R. is of great historical interest, from the fact that Magna Charta was signed by King John, June 15, 1215, either on this meadow, or on Charter Island, lying a short distance off the shore. The Great Charter itself professes to have been signed *pér munum nostram in prato quod vocatur Runnimede*. See MAGNA CHARTA.

RUNRIG LANDS, a peculiar species of property known in Scotland, by which alternate ridges of land belong to two individuals respectively. The origin of holding lands in this way is said to have arisen out of the practice of common defence and watching, and the common ploughing and laboring necessary or natural in the occupation of burgh acres and lands near towns. Each party is absolute proprietor of his own ridge; but owing to the obstruction often caused to agricultural improvement, a mode of compulsory division or allotment of the lands was introduced by statute in 1695. This remedy, however, does not apply to burgh acres, or to patches of land less than four acres in extent.

RUPEE' is the name of a silver coin current in India, of the value of 2s. English. The word is a corruption of the Sanscrit *rūpya*, from *rūpa*, shape, form, meaning, according to Pân'ini, a coin—not necessarily of silver—on which the shape of a *man*, according to the Kâs'ikâ commentary on this grammarian, is struck; and if this ellipsis of the word *man* is correct, as it very probably is, the word rupee would be of great numismatic interest, inasmuch as it would prove that even as early as at the time of the grammarian Pân'ini (q. v.) coins existed with a *human* figure impressed on them. The coin bearing the name of rupee was first struck by Shîr Shah, and was adopted by Akbar and his successors; it was of the weight of 175 grains troy, and was considered to be pure; but in the decline of the Mohammedan empire every petty chief coined his own rupee, varying in weight and value, though usually bearing the name and titles of the reigning emperor. In the reign of Shah Aalam, a great variety of coins bore his name and the years of his succession, until 1773, when they were suppressed in the territories subject to the East India Company, and a rupee was struck, called the Sicca rupee, with an inscription on it, which, translated, runs: 'The king, Shah Aalam, the defender of the faith of Mohammed, the shadow of the grace of God, has struck this coin, to be current through the seven climes;' and on the reverse: 'Struck at Murshidabad, in the 19th year of the auspicious accession.' Though rupees were coined also at Dacca, and finally only at Calcutta, and also at various dates, the place of coinage (the mint of Murshidabad) and the date just named (the 19th of Shah Aalam's reign) remained unaltered, in order to put a stop to the practice which money-changers had introduced, of levying an arbitrary rate of discount on rupees of different places of coinage and of previous dates, without reference to any actual diminution of weight by wear. Although the Dacca rupee was thus the actual medium of exchange, the Company's accounts were for a long time kept in a different valuation, or that of the *Chalanti*, or current rupee, 100 Sicca rupees being reckoned as equivalent to 116 Chalanti rupees. The Sicca rupee served also as a unit of weight—80 Sicca weight being equal to one *ser*, and 40 sers to one *man* or *maund* = 82 lbs. Beside the Sicca rupee, two other rupees were current in the Bengal presidency—the Benares rupee, which ceased to be struck in 1819, and the Farakhabad rupee.

At Madras, the rupee of the Nawabs of the Carnatic, originally

struck at Arcot, and at Bombay that of the Nawabs of Surat. became the currency of the Company. In 1818, the standard of the Sicca and Farakhabad rupees was altered, but their intrinsic value was unaffected, as they continued to have the same amount of fine silver. Other changes of these coins took place—of the latter in 1824, of the former in 1833; but in 1835, the coinage of the Company was entirely remodelled, and a coin, thenceforth termed the Company's rupee, with its proportionate sub-divisions, was struck to replace all the former currencies, being of the same weight and fineness throughout, and bearing inscriptions in English, or on one face the head and name of the reigning sovereign of Great Britain and Ireland, and on the reverse the designation of the coin in English and Persian, with the words 'The East India Company' in English. The latter, of course, have disappeared since India has been placed under the direct government of the English crown. The weight, intrinsic purity, and value of the British currency of these several coins were till lately:

But as silver is subject, in the London mint, to a seigniorage of nearly 6 per cent., the London mint produce of the rupee, if of full weight (11 dwts. fine), should be ls. 11½. Owing to the depreciation of silver, the value of the R. has fallen; the Sicca R. is now quoted only at 2s.

RUPERT, PRINCE, the son of the Elector-Palatine Frederick V., and Elizabeth, daughter of James I. of England, was born in 1619. In 1642, he received from his uncle, Charles I. of England, a commission to command a regiment of horse at Worcester against the Parliamentarians. The impetuosity with which he charged the enemy there, and in the battle of Edgehill, would have proved of greater use to the Royalists had not his rashness in pursuing the wavering foe nearly counteracted the advantages which he had already gained. Subsequently, at Chalgrove, Newark, and Newberry, he was more successful; but his petulant disregard of orders, and his hasty retreat from the field of battle at Marston Moor, resulted in a signal defeat, the consequences of which had a most disastrous effect upon the fortunes of the Royalist party. His conduct at Naseby, and his hasty surrender of the city of Bristol, irritated the king, who forthwith deprived him of his command, and requested him to leave England without delay. In 1648, however, he was recalled and appointed to the command of the royal fleet. In this new vocation he acquitted himself with much daring and somewhat more caution, and for three years he kept his ships afloat, after escaping the blockade in which he had been held for a twelvemonth off the Irish coast by the great parliamentarian Admiral Blake; but in 1651, the latter attacked the prince's squadron, and burned or sunk most of his ships. With the few vessels still remaining to him, R. escaped to the West Indies, where, in concert with his brother Maurice, he led a buccannering life, maintaining himself and his men by seizing upon English and other merchantmen. After a few years spent in this manner, R. managed to elude the vigilance of Cromwell's captains, and made good his way to France, where he remained till the restoration of his cousin, Charles II.

R. served with distinction under the Duke of York, and in concert with the Earl of Albemarle, against the Dutch, and died in 1682 in the enjoyment of various offices and dignities, being a privy councillor, a member of the Admiralty, governor of Windsor Castle, &c. The last ten years of his life were spent in retirement in the pursuit of chemical, mechanical, and physical researches, for which he evinced considerable aptitude. Although it is certain that he did not discover the art of engraving in mezzotint—the real inventor of which appears to have been a German, Von Tregren, whose early works bear the date of 1642—R. no doubt improved the mechanical mode of the art, which he described and illustrated for the Royal Society of London in 1662, after he had completed several interesting engravings on the new

principle. The glass bead known as Prince Rupert's Drop (q. v.) derives its name from the prince.

RUPERT'S LAND, so called from Prince Rupert (q. v.), who was one of the founders of the Hudson's Bay Company, was formerly the official designation of that extensive tract which forms the basin of Hudson's Bay and Strait, and is bounded on the west, south, and north by the water-sheds of the Arctic, St. Lawrence, and Atlantic rivers. The western boundary is from Deer Lake to a point a little to the west of the Red River Settlement (q. v.). In 1870, the territory held by the Hudson's Bay Company was admitted into the Dominion of Canada, a portion of R. L. falling within the province of Manitoba. The whole of the vast territory known as R. L. slopes inwards towards Hudson's Bay, and is well supplied with navigable rivers. The mountains of this region, which are chiefly on the boundaries, are of primitive rock, and a great portion of the country is densely wooded. The soil is rich, but on account of the severity of the climate—which is not only of a generally low temperature, but exceedingly variable in summer and autumn—the cereals and other alimentary plants are not cultivated to any extent; in fact, they are only planted in the neighborhood of the trading posts of the Hudson's Bay Company (q. v.) and in the agricultural settlement on Red River, in the south-west. In the north, the vegetation and climate are those of the polar regions.

The chief dependence of the inhabitants of R. L. for food and clothing is on the animal kingdom, which is here most abundantly represented. Beavers are still found, and bears, otters, martens, and muskrats, are abundant, their skins forming the chief commercial product of the country. There are also abundance of foxes of various colors, bears, wolves, Canadian lynxes, &c. Among the animals used for food are the wapiti, reindeer, moose, and other species of deer; the musk-ox, hares, and an immense variety of wood-fowl and other birds. The numerous rivers and lakes are abundantly stocked with fish. The population, which is scanty, is composed of British or Canadians, and aboriginal tribes.

RU'PIA is a somewhat severe form of skin-disease. It is characterized by flatish, distinct *bullæ* or blebs, containing a serous, purulent, or sanious fluid, which become changed into thick scabs. Several varieties of this disease have been established by dermatologists. In its simplest form, the blebs are not preceded by any inflammatory symptoms, are about an inch in diameter, and contain a fluid which is originally thin and transparent, but soon thickens, becomes purulent, and dries into brown ragged scabs, which are elevated in the center. The scabs are easily separated, and leave ulcerated surfaces, on which several successive scabs usually form before healing ensues. In a more severe form, known as *Rupia prominens*, the scab projects so much in the center as to resemble a limpet-shell in form.

Rupia is a chronic disease, and is usually limited to the limbs, the loins, and the nates. It is not contagious, and generally attacks persons debilitated by old age, intemperance, bad living, or previous diseases, especially small-pox, scarlatina, and syphilis. The general treatment consists mainly in the administration of tonics, such as quinia, the mineral acids, ale, wine, animal food, &c. Some writers strongly recommend the tincture of serpentaria; and there is no doubt that certain cases which will not yield to tonics, rapidly improve when treated with iodide of potassium. The local treatment consists in puncturing the blebs as soon as they arise, in removing the scabs by poulticing, and in applying a slightly stimulating application—such as a solution of nitrate of silver—to the subjacent ulcers. The disease is frequently tedious and obstinate, but the patient almost always ultimately recovers.

RU'PPIN, NEU, a town of Prussia, in the province of Brandenburg, on a small lake of the same name, which communicates by water with the Elbe, 38 miles north of Potsdam. It contains a castle, a lunatic asylum, and (1875) 12,501 inhabitants, who are engaged in brewing, spinning, and the manufacture of linen and woollen cloths.

RU'PTURE. See HERNIA.

RURAL DEAN, an official, ordinarily a beneficed clergyman, appointed in a diocese to maintain in a certain district; called a deanery, a supervision over the condition of churches, church furniture, glebe houses, schools, the appliances of public worship, and all other things appertaining to the service, and to report on all to the bishop as occasion may arise.

RURIK, who is considered to have been the founder of the Russian monarchy, was, according to most authors, a 'Varangian' of Scandinavian origin, who was invited by the Slaves of Novgorod to come and rule over them; according to others, he was the chief of a tribe of Norse colonists which was located near the Gulf of Finland, and, after a long contest, succeeded in subduing the northern Slaves and some neighboring tribes of Finns; while Kostomarov attempts to prove that he was a Lithuanian. That

he was either a Scandinavian or of Scandinavian origin, there seems to be very little doubt, and it is as generally maintained that, accompanied by his brothers, Sindf (Sineous) and Truvor, he, at the head of a small army, took possession of the country to the south of the Gulf of Finland, Lakes Ladoga, Onega, and Beloe in 861 or 862, and laid the foundation of a monarchy. His brothers afterwards settled, the one at Bielo-ozero, and the other at Izborsk; but dying without issue, their principalities were united to Novgorod by Rurik. Novgorod was made the seat of government in 864 or 865, and the various insurrections of his Slav subjects were quenched in blood, Vadim, their leader, whose valor is celebrated by the ancient chroniclers, perishing by R.'s own hand. To secure himself and his descendants in their newly-acquired territory, R. invited various colonies of Varangians to settle in the country, and after reigning peaceably from this time, he died in 879. During his reign, some of the Varangians attempted a land expedition against Constantinople, but renouncing the scheme, settled on the banks of the Dnieper, and founded the little state of Kiev. The family of R. reigned in Russia till the death, in 1598, of Feodor, son of Ivan the Terrible, when, after a brief intestine contest, it was succeeded by the nearly allied House of Romanoff (q. v.). Many noble families of Russia, such as Odojefski, Obolenski, Dolgorouki, Lfot, Belosselski-Beloserski, and Gagarin, are legitimately descended in the male line from R.; and the princes of Romodanofski-Ladyshenski are legitimate descendants in the female line.—See Prof. Thomsen's Lectures on this subject (1878).

RU'SA, a genus of *Cervidae*, or subgenus of *Cervus* (see DEER), containing a number of species of deer, natives of the forests of the East Indies, which may be described as stags with round antlers, a snag projecting in front just above the base of each, and the top forked, but the antlers not otherwise branched. They are generally of large size, and among them are some of the finest kinds of Asiatic deer. The GREAT R. (*R. Hippelaphus*) is sup-

Sambar (*Rusa Aristotelis*).

posed by some to be the *Hippelaphus* of Aristotle; but his description is not complete enough to identify the species. It is a native of Java, Sumatra, &c., and is about the size of a large stag, with brown rough hair, the neck with a long mane.—The SAMBUR or SAMBOO (*R. Aristotelis*), of India is a similarly large and powerful animal, and no Indian deer is more sought after by European sportsmen. It also is supposed by some to be the *Hippelaphus* of Aristotle. The color is sooty brown, and the male has a mane. It is solitary in its habits, and delights in low forests where water abounds.—The Axis (q. v.) is very nearly allied to this genus.

RU'SCUS. See BUTCHER'S BROOM.

RUSH (*Juncus*), a genus of plants of the natural order *Juncacea*, having a glume-like (not colored) perianth, smooth filaments, and a many-seeded, generally 3-celled capsule. The species are numerous, mostly natives of wet or marshy places in the colder parts of the world; some are found in tropical regions. Some are absolutely destitute of leaves, but have barren scapes (flower-stems) resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; some have plane or grooved leaves on the stems; some have very narrow leaves, all from the root. The name R. perhaps properly belongs to those species which have no proper leaves; the round stems of which, bearing or not bearing small lateral heads of flowers, and popularly known as *Rushes*, are used for plaiting into mats, chair bottoms, toy-baskets, &c.—The SOFT R. (*J. effusus*) is a native of Japan as well as of Britain, and is cultivated in Japan for making mats. In ruder times, when carpets were little known, rushes were much used for covering the floors of rooms; to which many allusions will be found in early English writers. The stems of the true rushes contain a large *pith* or soft central substance, which is sometimes used for wicks of candles.

There are 20 or 22 British species of R., some of which are very rare, some found only on the highest mountains, but some are among the most common of plants. They are often very troublesome weeds to the farmer. Thorough drainage is the best means

of getting quit of them. Lime, dry ashes, road scrapings, &c., are also useful. Tufts of rushes in pasture are a sure sign of insufficient drainage. Many marshy and boggy places abound in some of the species having leafy stems and the leaves jointed internally, popularly called *Sprots* or *Sprits*, as *J. acutiflorus*, *J. lamprocarpus*, and *J. obtusiflorus*. They afford very little nourishment to cattle; but are useful for making coarse ropes for ricks, &c., which are stronger than those made of hay.

RUSH, BENJAMIN, M.D., an American physician, was born near Philadelphia, December 24, 1745, was educated at Princeton College, studied medicine in Philadelphia, London, Edinburgh, and Paris, and in 1769 was made Professor of Chemistry in the Philadelphia Medical College, and became a contributor to medical literature. Elected a member of the Continental Congress, he advocated and signed the Declaration of Independence. In 1777, he was appointed Surgeon-general and Physician-general of the continental army. His duties did not prevent him from writing a series of letters on the constitution of Pennsylvania, which was changed by his influence. He resigned his post in the army, because he could not prevent frauds upon soldiers in the hospital stores. In 1785, he planned the Philadelphia Dispensary, the first in the United States; and was a member of the convention which ratified the Federal constitution. Retiring from politics, he became Professor of the Theory and Practice of Medicine in the Philadelphia Medical College; and was so successful in the treatment of yellow fever in 1793, that he was believed to have saved the lives of 6000 persons. His practice, in consequence, became so large that he prescribed for 100 patients a day, whom he saw even at his meals. Virulently attacked by Cobbett, who published a newspaper in Philadelphia, he prosecuted him for a libel, and recovered 5000 dollars damages. His medical works produced honors from several European sovereigns. The chief of them were *Medical Inquiries and Observations, Diseases of the Mind, Medical Tracts, Health, Temperance, and Exercise*. In 1779, he was appointed Treasurer of the United States Mint, which post he held until his death in Philadelphia, April 19, 1813.

RUSH-NUT. See CYPERUS.

RUSHWORTH, JOHN, an English author, whose work entitled *Historical Collections of Private Passages of State, Weighty Matters in Law, and Remarkable Proceedings in Parliament*, is a most important contribution to our knowledge of the civil war, and the events that led to it, belonged to an ancient family in Northumberland, and was born there about 1607. He studied at Oxford, but left the university without taking a degree, and settled in London as a barrister. His interest in political affairs was, however, so strong, that he appears to have spent a great deal of his time, for many years, in attending the Star Chamber, the Court of Honor, the Exchequer Chamber, Parliament, &c., and in taking down short-hand notes of the proceedings. When the Long Parliament met in 1640, R. was appointed assistant to Mr. Henry Elsyngne, clerk of the House of Commons, an office which afforded him ample opportunities for adding to his *Collections*. He rendered a variety of important services to his party during the civil war. The restoration of Charles II., in 1660, was fatal to his fortunes. Though not molested, he was one of those to whom the 'cold shoulder' was shown by the triumphant royalists. In 1677, Sir Orlando Bridgman, Lord Keeper of the Great Seal, appointed the old man, now (it is conjectured) in straitened circumstances, his secretary; and curious to say, we find him, two years after, a member of parliament. In 1684, when he had reached the age of 77, he was arrested for debt, and imprisoned in the King's Bench, where he died in 1690. His last years were rendered doubly miserable, partly by the loss of his understanding, and partly by his addicting himself to intemperance. R.'s *Historical Collections* were published in four parts. The first, embracing the period from 1618 to 1629, was published in 1659; the second, embracing the period from 1629 to 1640, in 1680; the third, embracing the next five years, in 1692; and the fourth, extending to 1643, in 1701. The whole was republished in 1721. The work has been violently attacked by royalist and High Church writers, as unfair, and even false, but their charges have not been substantiated.

RUSKIN, JOHN, the most eloquent and original of all writers upon art, was born in London in 1819. He studied at Christ Church, Oxford, where he gained the Newdigate prize for English poetry in 1839, and took his degree in 1842. The year following appeared the first volume of his *Modern Painters*, the primary design of which was to prove the infinite superiority of modern landscape-painters, especially Turner, to the old masters; but in the later volumes (the 5th and last was published in 1860), the work expanded into a vast discursive treatise on the principles of art, interspersed with artistic and symbolical descriptions of nature, more elaborate and imaginative than any writer, prose or poetic, had ever before attempted. *Modern Painters* was essentially revolutionary in its spirit and aim, and naturally excited the aversion and hostility of the conservatives in art. But the

unequalled splendor of its style gave it a place in literature; crowds of admirers and disciples sprang up; the views of art enunciated by R. gradually made way; and have largely determined the course and character of later English art. In 1849 appeared *The Seven Lamps of Architecture*; and in 1851—1853, *The Stones of Venice*, both being efforts to introduce a new and loftier conception of the significance of domestic architecture. They were exquisitely illustrated by the author himself. About this time, *Pre-Raphaelitism* began to develop itself as a distinctive phase of modern art, and R. warmly espoused its cause in letters, pamphlets, and *Notes* on the Academy Exhibitions (1855—1860). In 1854, he published four singularly pithy and ingenious *Lectures on Architecture and Painting*; and in 1858, two *Lectures on the Political Economy of Art*. Of less consequence are his *Notes* on Turner's Pictures and Drawings exhibited in 1857; *Elements of Drawing* (1857); *Elements of Perspective* (1859); *Unto this Last* (1862); *Study of Architecture in our Schools* (1865); *Crown of Wild Olive: Three Lectures* (1866); *The Queen of the Air, being a Study of the Greek Myths of Cloud and Storm* (1869); *Lectures on Art* (1870); *Munera Pulveris: Essays on Political Economy* (1872); *Aratra Pentelici: Lectures on the Elements of Sculpture* (1872); *Arrows of the Chace*, being a selection of his letters (1880); *The Lord's Prayer and the Church* (1880); and *Fors Clavigera*, a periodical pamphlet, which he issued for several years.

All Mr. Ruskin's books are now withdrawn from the usual channels of publication, and those of them still in print are issued by his own agent. From 1869 till 1879 he was Slade Professor of Fine Arts at Oxford; in 1871 he gave £5000 for the endowment of a master of drawing there. In 1871 the degree of LL.D. was bestowed upon him by the university of Cambridge. Since this time he has founded a museum at Sheffield, where he has bestowed part of his own priceless library and art treasures.

RUSSELL, HOUSE OF. The first dukedom of Bedford (q. v.) expired in the person of the great Regent of France (in the time of Henry VI.), with whom the present dukes are unconnected by affinity. The early descent of the Russells, and their derivation from the du Rozels of Normandy, have been traced by Mr. Wiffen in his *Memoirs of the House of Russell*. This great historical family is said to derive its descent from Olaf, the sharp-eyed king of Rerik, in the 6th c., one of whose descendants, Turstain, a Scandinavian jarl, settled in Normandy, on its conquest by the Northmen, and became possessed of the barony of Briquebée, and the castle of Rozel, near Caen. In a charter of Matilda, wife of the Conqueror, dated 1066, Hugh de Rozel appears as a witness, and is no doubt the same knight who accompanied William in his invasion of England, and assisted at the battle of Hastings. His name, together with that of his brother, are found on the roll of Battle Abbey. They both accompanied Duke Robert of Normandy in the first Crusade, where the elder died. The younger, Hugh de Rozel, upon his return from the Holy Land, established himself in England, and was the progenitor of Sir James Rozel, or Russell (as it had then begun to be called), governor of Corfe Castle in 1221, and of Sir W. Russell, who represented Southampton in the first parliament of Edward II. From the latter Russell directly descended Sir John Russell, one of the most valiant soldiers of the age of chivalry. His son, Sir John Russell, was Speaker of the House of Commons in the time of Henry VI.

The high fortune and eminence of the House of R. date from his grandson, JOHN RUSSELL, one of the most accomplished gentlemen of his time, who, in 1538, was elevated to the peerage, under the title of 'Lord Russell, Baron Russell of Cheyneys, county Buckingham.' His son, the second earl, was a person of eminence in Queen Elizabeth's reign, and was, like his father, a Knight of the Garter. The next notable member of the family was EDWARD RUSSELL, who was bred to the sea, and was groom of the bedchamber to the Duke of York, afterwards James II., but upon William Lord Russell's judicial murder, retired from court. Strenuously supporting the Revolution, he obtained high naval commands from William III., and distinguished himself as one of the most eminent naval heroes of the period, particularly by his victory over the French fleet at La Hogue, in 1692. His cousin was—

LORD WILLIAM RUSSELL, son of William, 5th earl, who has left an unperishable name, as one of the most glorious martyrs of English liberty. He was born September 1639; was educated at Cambridge; passed some years at Angsburg and other places on the continent, and returned to England at the Restoration. In 1678—1679, he was returned to parliament for the county Bedford. His first public act was worthy of his subsequent career. He inveighed against the corruption of the Cabal, the influence of France, the dishonorable commencement of the war with Holland, and the fraud practised upon the bankers. He was ever afterwards found conspicuous wherever the designs of the court could be traversed, or the cause of constitutional liberty befriended. He appeared publicly in the King's Bench at Westminster Hall,

June 16, 1680, and presented the Duke of York as a recusant. He also carried up to the House of Lords the bill of exclusion against the duke, at the head of more than 200 members of the Commons. This bill, setting forth that the Duke of York was a papist, declared him incapable of succeeding to the crown. The king and duke determined to be revenged upon Russell and the other leaders of the Whig party. Charged as participators in the Rye House Plot (q. v.), Lord Russell, the Earl of Essex, and Algernon Sidney were arrested. Russell was, July 13, 1683, arraigned at the Old Bailey for high treason.

Infamous witnesses easily satisfied a packed jury. As they were about to withdraw, the prisoner said: 'I call heaven and earth to witness that I never had a design against the king's life.' But the jury pronounced the fiat that condemned Russell to the block, and the horrible sentence of death for high treason was forthwith pronounced. The king and the Duke were determined to have his blood, and to crush the leaders of the Whig party. Some of the Tory ministry ventured to plead in his favor, but in vain. The Earl of Bedford had gained the king's favorite, the Duchess of Portsmouth, to his interest, and offered, through her, £100,000 for the life of his son. To satisfy his aged father, and at the earnest request of his afflicted wife, Russell himself petitioned the king. He solemnly disclaimed the least intention against the king's life, or the least design to change the constitution. There is reason to believe that Charles was disposed to relent, but that the Duke of York insisted upon the prisoner's death, which took place July 21, 1683. The simple relation of his last hours by Bishop Burnet, his intimate friend and companion, is justly considered one of the most pathetic passages in history. The murder of Russell, perpetrated for the most unconstitutional end by the most unconstitutional means, followed by that of Sidney, rendered the despotism of the Stuarts odious, and led, in the next reign, to the overthrow of the family. R. died in the 42d year of his age, leaving a name to be remembered and revered wherever truth has a sanctuary or liberty a shrine. His attainder was annulled after the Revolution. His widow, LADY RACHEL WRIOTHESLEY, second daughter and heiress of Thomas Earl of Southampton, survived her lord more than forty years. She cherished the memory of her lord with the most tender recollections. She died September 29, 1723, at the advanced age of 86. Her eldest son by Lord Russell was WRIOTHESLEY, second Duke of Bedford.

JOHN, fourth duke, was First Lord of the Admiralty in the Pelham administration of 1744. He became, in 1756, Lord-lieutenant of Ireland. In 1762, he was accredited Minister Plenipotentiary to the court of France, and signed at Fontainebleau the preliminaries of peace with France and Spain. He was President of the Council in the administration formed by Mr. Grenville in the autumn of 1763. His concern with public affairs extended over the important term comprised between the fall of the administrations of Walpole and Chatham. When First Lord of the Admiralty (from 1744 to 1748), he shared with Mr. Pelham, the premier, and the Duke of Newcastle, the substantial power of the government. His correspondence, preserved at Woburn Abbey, and given to the world by Earl Russell, contains authentic materials for the illustration of the political history of England from 1744 to 1770. The introduction to the first volume contains a brief but able historical sketch by the noble editor of the period from the administration of Walpole to 1748, and some interesting particulars of the private life and personal character of the duke. He died in 1771, and was succeeded by his grandson—

FRANCIS, fifth duke, born in 1765. He was a steady friend to the cause of popular freedom, and was regarded by his friends, among the most devoted of whom was Charles James Fox, with feelings of attachment amounting to enthusiasm. He died unmarried in 1802, and was succeeded by his brother—

JOHN, sixth duke, born 1766, father of Earl Russell (q. v.). He died October 20, 1839, and was succeeded by his eldest son—

FRANCIS, seventh duke, who, after a short career in the Lower House, was summoned to the House of Lords in his father's barony of Howland. He declined office, but invariably supported the views and measures of the Whig governments, and in the discussions among the Whig party, the political congresses at Woburn exercised great influence. He was much consulted by his distinguished brother, when First Lord of the Treasury, and on more than one occasion, his advice on political affairs was sought by his sovereign. He was an enthusiastic patron of the turf from early life, and his stud at Newmarket was of princely dimensions. Of late years, he devoted himself to the happiness of his tenantry and the comfort of the laborers on his extensive estate. He died May 14, 1861, and was succeeded by his only son—

WILLIAM, eighth duke, born in 1809. He was M.P. for Tavistock from 1832 to 1841, but was most retired in his habits, and took no active part in political affairs. He died May 26, 1872, and was succeeded by his cousin—

FRANCIS, ninth duke, born 1819, eldest son of the late Major-general Lord George Russell, second son of John, sixth duke.

The heir-apparent to the dukedom is his son George, Marquis of Tavistock.

The Dukes of Bedford have a magnificent mansion and park at Woburn, near Bedford.

RUSSELL, JOHN RUSSELL, EARL, K.G., English minister and statesman, third son of the sixth Duke of Bedford, was born in Hertford Street, Mayfair, London, August 18, 1792, educated at Westminster School, whence he was sent to Edinburgh, at that time preferred to the English universities by the great Whig families. Here he pursued his studies with industry and success, under the care of Professor Dugald Stewart; and here, at the meetings of the Speculative Society, he first exercised his powers of debate. In 1809, he proceeded on a continental tour, and France being closed against English travelers, he directed his steps to Portugal and Spain.

In 1821 appeared his *History of the British Constitution*, and in 1824, *Memoirs of the Affairs of Europe from the Peace of Utrecht*. In more recent years he compiled from the family archives and gave to the world the *Correspondence of John, fourth duke of Bedford*, which throws much light on the secret history of the early part of George III.'s reign; the *Life, Diary, and Letters of Thomas Moore*, in pursuance of a promise made to the poet several years before; the *Correspondence of Charles James Fox*, and *Life and Times* of that great Whig statesman. Having now noticed his career as an author, we may briefly pass in review his long, honorable, and consistent career as a politician. In 1818, he was elected for the family borough of Tavistock, and vigorously but vainly opposed the repeal of the Habeas Corpus Act in 1817. He made his first motion in favor of parliamentary reform in 1819, and continued to bring the subject almost annually before the Lower House, until he stood forward as a minister of the crown to propose the great measure of 1831. He was also the strenuous advocate of the repeal of the Test and Corporation Acts, Roman Catholic Emancipation, and other measures of civil and religious liberty. In 1828, he carried by a large majority his motion for the repeal of the Test and Corporation Acts, although it was opposed by the Duke of Wellington's government. In 1829, he supported the Catholic Emancipation Bill. At the general election of 1830, caused by the death of George IV., the rallying cry of Parliamentary Reform sent many additional Liberals into the House of Commons. The 'Great Duke' was driven from office; and Earl Grey being appointed prime minister, proceeded to form a cabinet pledged to peace, retrenchment, and reform.

R. did not receive a seat in the cabinet, but he was appointed to the lucrative office of Paymaster of the Forces, and was one of the four members of the government to whom Earl Grey intrusted the task of framing the draft of the first Reform Bill. The great and imperishable honor next devolved upon R. of proposing the bill (March 1, 1831). The fortunes of the measure belong to the history of the time; suffice it to say, that on the 4th of June 1832 the bill obtained the royal assent, and that the country was saved from the throes of revolution and civil war, which at one period appeared imminent. R. left office with the Melbourne government (which had succeeded to that of Earl Grey) in November 1834. In March 1835, he brought forward a motion in favor of taking into consideration the temporalities of the Irish Church. It was opposed by the government, but after three nights' debate, was carried by 322 votes against 289. On the 4th April, he carried a resolution in committee in favor of appropriating any surplus which might remain, after fully providing for the spiritual wants of the members of the Irish Church, to the general education of all classes of Christians. The report of the committee having been affirmed by the whole House, the government of Sir Robert Peel was dissolved, and that of Lord Melbourne restored. R. now became Home Secretary, with a seat in the cabinet. On the 5th of June 1835, he brought in an important bill for the reform of the municipalities of England and Wales, which was carried after some mutilation, and secured an effective reform of municipal institutions. Next session, he proposed and carried the government plan for the commutation of tithes in England. Also a bill for a general registration of marriages, births, and deaths, the value of which, in social and statistical inquiries, can scarcely be overrated; and a bill for the amendment of the marriage laws, which enabled dissenters to be married in their own chapels.

He likewise passed an English Church Reform Bill, making a new distribution of episcopal dioceses and incomes. In 1837, he carried a series of bills for further amending the criminal law, by which capital punishment was finally removed from forgery and all offences except seven. An Irish Tithe Bill was also passed, but the 'appropriation clause' being always rejected by the Lords, R. was obliged to accept the bill divested of the clause. He exchanged the seals of the Home for those of the Colonial Office, when the Canadians broke into rebellion in 1839, and sent over Lord Durham, who recognized the right of the Canadians

to self-government; and who, with his successor, Lord Sydenham, brought the Canadas into loyal and harmonious relations with the mother-country, which have never since been disturbed.

In 1841, R. proposed a fixed duty of 8s. per quarter on foreign corn, and a reduction of the duties on sugar and timber. Being defeated by the opposition, the Melbourne government appealed to the country without success; and R. and his colleagues made way for the administration of Peel. In this general election, he challenged the verdict of the city of London upon the free-trade measures of the government, by boldly leaving Stroud, and standing for the city. He was elected by the narrow majority of nine votes, and continued to represent the city until his elevation to the peerage. In November 1845, R. wrote a letter from Edinburgh to the electors of the city of London, announcing his conversion to the total and immediate repeal of the corn laws. This letter led to the resignation of the Peel cabinet; and R. was commissioned by the Queen (December 11, 1845) to form an administration, which at first he failed to do through the antipathy of Earl Grey to Lord Palmerston, and Sir Robert Peel being recalled to power, had the honor of carrying the repeal of the corn-laws. His Irish Coercion Bill, however, being defeated by the combined Whigs and Protectionists, he resigned; and R. became nominally what he had been really during the greater part of the Melbourne administration—prime minister.

In 1846, a series of assassinations in Ireland compelled him to propose a more stringent coercion act than that of the previous session. In 1847, he had to deal with the Irish famine; and in 1848, with a miniature Irish rebellion. The papal bull, parceling England into dioceses, extorted from R. an indignant protest, first in the form of a letter to the Bishop of Durham, and next in the Ecclesiastical Titles Bill of 1851, prohibiting the assumption of territorial titles by Roman Catholic prelates. R.'s advice to the Queen to dismiss her Foreign Secretary and his ancient colleague, Lord Palmerston, for communicating, without consultation with his colleagues, his approval of the French *coup d'état*, precipitated the downfall of the R. administration, and in February 1852, he ceased to be First Lord of the Treasury. Lord Derby made an unsuccessful attempt to carry on the government; and in the succeeding cabinet of the Earl of Aberdeen, R. consented, December 1852, to fill the post of Foreign Secretary with the leadership of the House of Commons. In the session of 1854, he brought forward a new Reform Bill, but was most reluctantly compelled to resign it in consequence of the Crimean War. He was next appointed Commissioner to the Congress of Vienna, and incurred so much unpopularity by recommending terms of peace, and a plan of counterpoise suggested by Austria, that he was forced by the pressure of unfavorable opinion to leave the ministry (July 1855). He voted against the government on Mr. Cobden's motion against Lord Palmerston's Chinese policy, which led to a dissolution. When the second administration of Lord Palmerston was formed (June 1859), R. became for the second time Foreign Secretary, which office he held until 1865. He threw the moral influence of his name and the nation he represented into the scale of Italian unity and independence. He uttered warnings and remonstrances against the annexation of Savoy and Nice by France, which gave great offence to the government of the Emperor Napoleon by their frankness and candor. He ably preserved British neutrality in the civil war between the Federal and Confederate States of America. He wrote spirited dispatches expressive of the indignation with which the British government regarded the despotic acts of Russia in Poland; but he incurred many reproaches from the Poles and their sympathizers in France and England, for withdrawing from the Austrian and French alliance when war with Russia appeared imminent.

More recently, he took an active but not a successful part in the Slesvig-Holstein dispute, which the peculiar policy of the French emperor brought to nothing. R. always took a very prominent part in promoting the education of the people, and, with the assistance of Lord Lansdowne, laid the foundation of the present system of national education, supported by parliamentary grants, and administered by the Committee of Privy Council for Education. He brought forward for many years a measure admitting the Jews to parliament, which passed in 1858 upon a compromise suggested by the Earl of Lucan. But the question with which he has ever been identified in the public mind is parliamentary reform. He brought in a Reform Bill in 1852, a second in 1854; moved the resolution which procured the condemnation of the Derby Reform Bill in 1859; and in 1860, brought in another government bill, which failed to pass. In 1861, he was called to the Upper House, and exchanged the courtesy title of 'Lord John,' by which he had been so long known, for that of Earl Russell. On the death of Lord Palmerston in 1865, Earl R. became prime minister for the second time. In 1866 he and Mr. Gladstone introduced a Reform Bill, which was rejected, and the ministry shortly thereafter resigned. Thenceforward, till near the time of his death, 28th May 1878, Earl R. remained an active but un-

official member of the Liberal party in the House of Lords. Though his voice was weak and his delivery affected, Earl R. was an admirable and successful debater; and his speeches sometimes rose to a high order of oratory. His indomitable self-reliance and tenacity of self-assertion were sarcastically painted by the Rev. Sydney Smith, who called him the 'Lycurgus of the Lower House.' Since the works mentioned above, Earl R. published his *Recollections and Suggestions* (1875) besides selections from his speeches and despatches, and various addresses; and, in 1873, the veteran statesman entered fearlessly on a new field, and gave us his *Essays on the Rise and Progress of the Christian Religion in the West of Europe*.

RUSSIA, EMPIRE OF, extending over a large proportion of the northern regions of the globe, includes the eastern part of Europe, the whole of Northern Asia, and a part of Central Asia. Lat. 38° 30'—78° N.; long. 17° 19' E.—190° E. (170° W.). The portion of North America which formerly belonged to R. was ceded to the United States in 1867. R. is bounded on the N. by the Arctic Ocean; on the E. by the Pacific Ocean; on the S. by the Chinese empire, Turkestan, Caspian Sea, Persia, Asiatic Turkey, and the Black Sea; and on the W. by Roumania, Austria, Prussia, the Baltic, and Sweden. The area of R. amounts to more than 8,000,000 square miles, and is more than double the entire area of Europe. The empire thus covers nearly $\frac{1}{4}$ th of the surface of the globe, and more than $\frac{1}{4}$ th of the land superficies of the planet. The population of this vast area, including recent extensions in Bessarabia, Armenia, and Central Asia, was in 1879-80, officially estimated at 98,356,100 (of whom 83,600,000 were in European R., and 14,700,000 in Asiatic R.). The following table gives the figures for 1870:

Name of Government.	Area in Eng. square miles.	Population in 1870.
1. Archangel	286,595	281,112
2. Astrakhan	84,969	601,514
3. Bessarabia	14,006	1,078,932
4. Courland	10,550	619,154
5. Don Army, Province of the	61,900	1,086,264
6. Ekaterinoslav	26,128	1,852,300
7. Esthonia	7,607	323,961
8. Grodno	14,953	1,008,521
9. Jaroslavl	13,751	1,000,748
10. Kaluga	11,870	996,252
11. Kazan	23,714	1,704,624
12. Kharkov	21,004	1,698,015
13. Kherson	27,455	1,596,809
14. Kiev	19,671	2,175,132
15. Kostroma	30,796	1,776,097

Central Asia	1,320,765	4,650,218
Russian Empire	8,264,200	86,586,000

The Russian Sea-board.—The northern shores of the Russian territories, which are washed by the Arctic Ocean, are deeply indented. The White Sea (q. v.), an immense arm of the Arctic Ocean, penetrates 350 miles into the mainland, and is sub-divided into the gulfs of Onega and Archangel or Dwina. The other chief inlets on the north of R. are the Kara Sea and the gulfs of Obi and Yenisei. Westward from Nova Zemla (usually, but less correctly, spelled Zembla), the Arctic Ocean is navigable for three months of the year; east from that island, the sea, even at the mildest season, is encumbered with floating icebergs. The chief inlets in this ocean are the Kolguef, Waigatz, Nova Zemla, and Spitzbergen Isles. The eastern shores of R. are washed by the Pacific, subdivided into the Behring, Okhotsk, and Japan Seas; and the islands belonging to this country in these seas are Sakhalin, and the northern part of the Kuriles. On the south are the Black Sea (q. v.) and the Sea of Azov (q. v.), the latter communicating with the former by the Strait of Kerch, and so shallow that it is navigable for small craft only. Of the Caspian Sea, R. commands the whole, with the exception of the south shore, which belongs to Persia. The northern and eastern banks of the Caspian are the seats of the chief fisheries of the empire. On the north-west of R. are the Baltic Sea, with the gulfs of Riga, Finland, and Bothnia; and in these waters, the islands of Aland, Esel, and Dago belong to the empire. The freezing of the water near the shores of the Baltic renders the navigation of this sea impracticable during five months of the year, although a few ports are accessible throughout the whole year. Possessing means of easy communication with the most fertile governments of the interior, and sustaining chiefly the commerce of the Russian empire with the other parts of Europe and with America, the Baltic is of the highest commercial importance.

Surface, Hydrography, and Soil.—European Russia consists of a vast plain bordered with mountains. On the east are the Ural Mountains (q. v.), forming a broad range of no great elevation, ending on the north on the shores of the Arctic Ocean, and on the south in a range of elevated plains on the left bank of the Volga. On the south-east of the great plain is the lofty range of the Caucasus (q. v.), crossed by the Pass of Derbend and the so-called Military Georgian Road. The Crimean Mountains, a continuation of the Caucasian chain, rise to 5000 feet in their highest summit. The districts in the south-west of R., between the Vistula and the Pruth, are covered by hilly ranges from the Carpathian Mountains (q. v.), which in Poland are known as the Sandomir Mountains. The Finland Mountains, on the north-west, are ranges of granite rocks, embracing numerous lakes, and not rising higher than 600 feet. The Alaunsky tableland, which connects itself with the Ural Mountains by a chain of hills in latitude about 62° N., is the key to the configuration of European Russia. From this table-land, with an elevation of about 1200 feet, the country, with gradually declining slopes, falls away in four directions—north to the Arctic, north-west to the Baltic, south to the Black, and south-east to the Caspian Seas. The sloping country on the north of the Alaunsky heights is called, from its eastern and western limits, the Ural-Baltic table-land; that on the south of the same dividing heights is called, for the same reason, the Ural-Carpathian table-land. The Alaunsky heights form the great water-shed, and regulate the course of all the great rivers of the Russian empire. To the north, they throw off the Petchora, the Northern Dwina, and the Onega; to the south, the Dniester, Bug, Dnieper, Don, and Kouban; to the south-east, the Volga, with its great affluents the Oka and Kama. The Western Dwina, the Niemen, and the Vistula, fall into the Baltic Sea. The important rivers of R. receive separate notice under their own names. At the foot of the north-west slope from the central terrace, is the lake-country of European Russia, and the great lakes (which are noticed separately) are Ladoga, Onega, Ilmen, Peipus, and Pskov.

The plain of European Russia naturally divides itself into three tracts or zones, each of which differs from the others in the nature and quality of its soil. The northern zone extends between the Arctic Ocean and the Ural-Baltic table-land, the middle zone between the Ural-Baltic and the Ural-Carpathian table-lands, and the southern zone between the Ural-Carpathian table-land and the Black and Caspian Seas. The soil of the northern zone is marshy, and the climate inclement. In its middle part, between the rivers Onega and Mezen, and especially along the banks of the Northern Dwina, forests of fir-wood and large tracts of fodder-grass occur. Toward the east of this tract, the woods disapp-

pear, and vast marshes, frozen the greater part of the year, cover the country. The middle zone reaches south-west to the government of Volhynia and the south of Poland, and north-east to the Ural Mountains. In the west, it consists of an extensive hollow, covered with woods and with marshes, the chief of which are those of Pinsk (q. v.). In the middle part of this zone, the soil is partly heavy and covered with mould, and toward the north, sandy. Beyond the Oka, luxuriant meadows abound; and on the east, beyond the Volga, this tract forms an extensive valley, covered with a thick layer of mould, abounding in woods, and rising into hills in the vicinity of the Ural range. The southern zone consists of steppes extending along the shores of the Black and Caspian Seas. The steppes of the Black Sea have mostly a mouldy soil, covered with grass, but in the south-east, shifting sands and salt marshes predominate. The steppes of the Caspian consist of sand, salt marshes, and salt lakes—the Elton lake, yielding nearly 4,000,000 puds (about 1,200,000 hundredweights) of salt annually, being the most remarkable.

Constitution and Administration.—The government is an unlimited monarchy, the head of which is the emperor, who unites in himself every authority and power—that is to say, is the head of the military, the legislative, and the judicial systems, and is also the ecclesiastical chief of the orthodox Greek Church. The order of succession is by primogeniture, hereditary in heirs-male, and in females in default of males. The expenses of the imperial house amount to about £1,500,000 annually; the private property of the imperial family, yielding about £1,000,000 annually, is excluded from the budget. Every military or civil officer of the crown is required to take an oath of allegiance. The council of state is the highest branch of the executive, and comprehends the legislative, judicial, and administrative powers. The president and members—among whom are always included the ministers of the crown—are appointed by the emperor. A secretary of state, whose duty it is to report the opinion of the council to the emperor, is attached to this body. The estimates of expenditure and income, and every proposition introducing an addition to, or a modification of, the laws, is considered and revised by this council, which, for the more orderly discharge of its functions, is divided into three sections: 1. Law; 2. Civil and Ecclesiastical; 3. Economy and Finance. The main function of the council is that of superintending the general administration, of watching over the execution of the laws of the realm, and of proposing alterations of the same when necessary. The second of the great boards of government is the senate, whose functions are partly deliberative and partly executive. It is the High Court of Justice for the empire, controlling all the inferior tribunals; and besides its legal duties, it examines into the state of the public revenue and expenditure. The senate is divided into seven committees or departments, of which five sit at St. Petersburg and two at Moscow. The third college is the Holy Synod, superintending the religious affairs of the empire. Its decisions have no force till approved by the emperor.

The fourth great board of government is the Committee of Ministers, the highest administrative body. It is divided into nine departments, which have under their management the Court; Foreign Affairs; War; the Navy; the Interior; Public Instruction; Finance; Crown Domains; Public Works; and has besides a general board of control. All of these great boards center in the private cabinet of the empire. Except the departments of Foreign Affairs and the Imperial Court, all these branches of the central administration are represented in the provinces. European Russia is divided into 50 provinces, over each of which is a governor, appointed by the emperor, and who is the head of the civil administration of the province or government. Some provinces, although administered by governors, are united under the superintendence of a governor-general. This arrangement is rendered necessary owing to the immense extent of the empire, and the governor-generalships are generally remote frontier regions. Of late years (especially since 1862), reforms have been effected throughout all the various branches of the government. Reforms in the municipal and rural administration of the provinces have given increase of self-government. A new legal system, including oral testimony, trial by jury, and publicity of courts, was introduced in 1864. By the Russian law, capital punishments are only inflicted for high treason. The severest punishments inflicted for violations of the law (see *KNOUT*) are labor in the galleys, in the public works, deportation to the mines of Siberia, &c. The audacity of the revolutionary party known as Nihilists (see *NIHILISM*) has caused of late increased rigor and frequency of political punishment. Repeated and fatal attempts on the life of high-placed officials, and the acquittal by a jury of one of the most notable assassins, led in 1878 to the withdrawal of trials for political offences from juries; such trials are now conducted by courts-martial.

Distinctive Rank of Classes.—The nobility occupy the highest place in the social scale, enjoy many special privileges, such as freedom from poll-tax, and form in every province a separate

body, headed by a marshal, chosen by and from themselves. Till 1871 they were also free from the conscription. Functionaries, officials, artists, and clergy possess almost as many privileges as the nobility. In 1863, a most important measure was passed, by which the clerical character was declared to be no longer hereditary, and the sons of the secular clergy, hitherto bound to some ecclesiastic or monastic service, were set free to choose their own career. The next class is that of the merchants. The burghers and peasants constitute the lowest class, and are subject to claims of service, and to personal taxation. Each class enjoys, to a certain extent, the right of self-administration in its own affairs. Each apportions its taxes, and chooses some of its own functionaries. The recent emancipation gave freedom to 20,000,000 peasants or serfs, who, prior to the year 1861, being governed exclusively by their owners, enjoyed very limited civil rights. Communal government is the fundamental principle of all the rights of the peasant class. In general, the lands allotted to the peasants are not their individual property, but belong to the commune, and are shared among all its members.

National Debt.—The national debt must be regarded as divided into two parts, one of which represents the loans made abroad, and the other the loans made at home. Its total amount was given in 1878 at £350,000,000, about half of which was contracted abroad. Several recent loans have been raised in order to tide over the terrible financial stress produced by the late war with Turkey, the expenditure for which has been officially stated (greatly understated, it is believed) at £180,000,000.

Revenue and Expenditure.—The following table shows the amount and the details of the revenue and expenditure for the year 1873:

REVENUE.

1. Direct Taxes (including Poll-tax).....	£14,887,697
2. Indirect Taxes (including those derived from Spirits, Salt, Tobacco, Beet-sugar, Customs, and Stamps).....	84,118,422
3. State Monopolies (drawn from Mines, Money, Post-office, Telegraphs).....	2,957,611
4. State Domains.....	5,458,088
5. Miscellaneous Receipts.....	6,327,174
6. Revenue of the Trans-Caucasus.....	750,782
7. 'Recettes d'Ordre'.....	2,690,842
8. Extraordinary Receipts.....	948,674
Total.....	£68,139,285

EXPENDITURE.

1. Public Debt.....	£11,833,092
2. Superior Institutions of the State.....	244,842
3. Holy Synod.....	1,288,483
4. Ministry of the Imperial Household.....	1,226,581
5. " Foreign Affairs.....	343,226
6. " War.....	21,452,618
7. " Marine.....	2,845,105
8. " Finances.....	10,623,946
9. " Imperial Domains.....	1,313,404
10. " Interior.....	5,821,457
11. " Public Instruction.....	1,541,863
12. " Public Works.....	3,072,158
13. " Justice.....	1,449,859
14. Audit of the Empire.....	274,063

There is usually a large deficit; though the budget often promises better things. Thus, the budget for 1880 stated revenue at £95,207,500, and the expenditure at a little less. The debt in 1880 was upwards of £350,000,000, besides paper money in forced currency.

Army.—The regular standing army dates from the close of the 17th c. Before that time, military levies were raised for longer or shorter periods. Till lately the army was raised by conscription; but in 1870, an imperial ukase announced the principle of universal liability to military service and another in 1874 reorganized the entire military system. There is an annual conscription to which all men who have completed their 21st year, and are not physically incapacitated, are liable. Substitution is prohibited. The period of service in the army is fifteen years, six in active service, and nine in the army of reserve. During the latter period, the soldier is liable to service only in time of war. To enable the educated classes to free themselves from compulsory conscription, young men, sufficiently educated, may enter

on a short period of service from their 17th year. On the 1st January 1863, the standing army, including the guard, consisted of 81,110 generals, staff, and commissioned officers, and 818,105 privates and non-commissioned officers. This force was divided into 608 battalions of infantry, 318 squadrons of cavalry, and 182 batteries of artillery. Besides this establishment, there were 300,000 irregular troops, consisting of Cossacks, Kirghiz, Circassians, and other contingents, who are liable to military service in lieu of paying taxes. The law of 1874 thoroughly remodelled the whole military organization of the Cossacks, who now form in time of peace a perfectly organized body of men, easily attached to the cavalry division in time of war. In peace they have 21 regiments and 8 horse-batteries, increased in war to 62 and 22 respectively. The grand-duchy of Finland has a military system of its own. The Russian army, on the peace footing, consisted, in 1879, of about 770,000 men, of whom about 470,000 belong to the regular army, and 300,000 to the reserve. In time of war the number can be raised to 1,500,000. (For further details see *ARMIES, MODERN*.) The expenditure for the army, as set down in the estimates for 1880, was £27,095,900.

Navy.—The Russian boundaries were first advanced to the sea under Peter the Great, and from the genius of that monarch the Russian navy sprang. Besides the naval depôts on the Baltic, the Black, and the Caspian Seas, there are also naval establishments on the shores of the North Pacific and on the Amur. In 1875, Russia had 137 war-vessels in the Baltic Sea, 81 in the Black Sea, and 55 on other waters. In all, there were 233 ships with an aggregate burden of 190,000 tons, 29 being iron-clads. The expenditure for the navy was, in 1880, estimated at £4,078,000.

Religion and Churches.—Toleration of all religions which do not violate public morality or good order, exists in R., and not to profess the orthodox Greek faith, the national religion, does not disqualify for the enjoyment of any civil rights. The law does not allow those who already belong to the established faith to secede from it; and if, in a household, either of the parents be a member of the Greek Church, all the children must be brought up within that communion. The emperor is head of the church, the affairs of which he directs by means of a synod composed of the chief prelates, who are summoned from their dioceses to attend its meetings (see *RUSSIAN CHURCH*). The direction and regulation of all other religious communities emanates from a department in the offices of the Minister of the Interior. In 1871, there were in European R., exclusive of Finland and Poland, 58,139,247 orthodox Greeks; 922,079 Raskolniks; 37,136 Gregorian Armenians; 2,892,991 Roman Catholics; 2,234,112 Protestants; 1,829,100 Jews; 2,358,766 Mohammedans; and 255,503 heathens. In 1861, there were 614 orthodox convents, 137 of which were occupied by women. There were 5648 monks, and 4879 lay-brothers; 2931 nuns, and 7669 lay-sisters; 50,394 priests and deacons, and 63,421 other persons, who were employed in religious services in the 50,165 orthodox churches. For the education of the clergy, there are 4 academies, 50 seminaries, and 201 schools, in which 54,000 persons are trained. The churches, convents, and the ecclesiastical departments in general, are maintained by government.

Public Instruction.—The department of public instruction in R. is presided over by a ministry, although many of the schools are directed by other departments. The greater number of these establishments are supported out of the imperial treasury. Russia in Europe, excepting Finland, is divided into nine educational districts—namely, St. Petersburg, Moscow, Dorpat, Kiev, Kharkov, Kazan, Odessa, Wilna, and Warsaw—each, Wilna excepted, having a university. Of the students—who do not reside within the universities—the poorest are allowed stipends for their maintenance, and the candidates for admission as students must have passed satisfactory examinations in the courses of instruction gone through at the gymnasias. Degrees are conferred in law, medicine, philology, mathematics, natural history, and the oriental languages. Degrees in theology are granted at Dorpat to students of the Lutheran faith. The professors are appointed and paid by the government. Four institutions, the law school and lycæums of St. Petersburg, Nijni, and Jaroslavl, are specially devoted to legal science. The gymnasias, schools of the second class, about 130 in number, are found in the provincial towns. Besides the universities and gymnasias, there are numerous districts schools; but the means of instruction, though rapidly increasing, are very insufficient. In 1853, there were only 3000 village schools; in 1863, the number had enormously increased. There are also numerous special schools for instruction in mining, in wood-craft, civil engineering, navigation, &c. The military schools form a separate system. The cadets are transferred from the military gymnasias to the 'military schools,' in which they qualify to fill the posts of commissioned officers. Three academies, for the staff, the engineers, and the artillery, are devoted to the higher branches of military science. Theological education for the orthodox church is superintended by the clergy. According to the report of the minister of public instruction, there were in 1875, in the nine educational districts,

20,376 primary schools, attended by 670,186 boys and 169,379 girls.

Literary and Scientific Institutions, Museums, Press, &c.—Many of the most important institutions in R., as the Academy of Sciences and the Pulkova Observatory, flourish in or near St. Petersburg (q. v.). There are, however, throughout the empire numerous institutions and societies for the promotion of the arts and sciences. The Imperial Library at St. Petersburg, with upwards of a million volumes, is one of the finest in the world. The press of R., not yet much developed, is subject to special censorship, which, though rigorously exercised under the reign of Nicholas I., became, under the milder government of Alexander II., considerably less strict. Each year gives evident proof of the rapidly increasing taste for literature and mental culture in Russia. In 1863, there were published within R. and in the Russian tongue, 1652 volumes. In the years 1873 and 1874, 5206 books were published in Russia, of which 447 were translations from other languages.

Charitable Institutions are for the most part supported by government; and although their number is increasing annually, the scarcity of large national institutions—especially public hospitals—is painfully felt. Medical assistance can only be obtained in the provinces with the greatest difficulty, owing to the distances of the towns and the sparseness of the population. The founding hospitals of St. Petersburg and Moscow receive annually about 15,000 abandoned infants and orphans.

Public Roads, Railways and Canals.—Good roads and ready means of communication are a great want in R., where the distances are so great, and the population so scanty. To keep the roads in repair, is a work of the greatest difficulty here, for two reasons—the first, a difficulty in concentrating a sufficient amount of labor where the laborers are so few, and so widely dispersed; and the other, the melting of the snows and overflowing of the rivers in spring. During four or five months of the year, the soil is thickly covered with snow, which, when it becomes hardened by the frost, offers an excellent, an easy, and a universal means of transit. On the return of mild weather, however, the snow melting, sinks into and softens the earth, which is also overflowed by the rivers. The roads being thus flooded, are rendered almost wholly impassable for traffic till the soil dries. In autumn, the usual rains fall, and the earth is again soaked, so that the time for easy communication during the summer is very short. In 1856 only 784 miles of railway had been opened, though a large extent was being constructed; but in 1882 there were 14,100 miles in operation (besides 540 miles in Finland), and 1100 miles in construction. Several of the chief cities of the empire are connected by means of macadamized causeways, which are now generally kept in good repair. The other towns are connected by ordinary track-roads, which are generally impracticable in spring and autumn. Owing to the generally bad character of the surface, and to the abundance of the rivers which traverse it, the water-communications of this empire are very important as commercial highways, though the vast transit-trade of the country is not confined to them alone. The transport of merchandise across the broad expanse of the empire, is much facilitated by canals, which have here become an important and a peculiar institution. The four seas surrounding European Russia are connected by canals: 1. The Caspian is connected with the White Sea by the canal of the Prince of Wirtemberg, between the river Schekсна, an affluent of the Volga, and the upper waters of the Northern Dwina. 2. The Caspian and Baltic are connected by three systems of canals. See *VOLGA*. 3. The Black Sea is connected with the Baltic by three lines of canals—those of Beresina, Oginsky and Dnieper, and Bug, between the affluents of the Dnieper and those of the Western Dwina, Niemen and Vistula.

Postal Service.—This service was inaugurated in 1664. In 1875 there were forwarded 63,244,156 letters, 1,419,094 post-cards, 42,776,320 newspapers and stamped periodicals, and other packets, amounting in all to 121,517,735. The number of offices was 4458 in 1880, and of letters, &c., 227,000,000.

Electric Telegraph.—Notwithstanding the immense extent of the surface of R., and the distance from each other of its principal towns, these are now nearly all united by lines of electric telegraph. In January 1875 upwards of 40,000 miles of telegraphs had been laid by the Russian government, and 13,000 miles by private companies. In the end of November 1871, the telegraph line through Siberia, connecting St. Petersburg with China and Japan, was finished, and a telegram forwarded from Nagasaki to the Russian capital. In 1878, there were sent 4,374,500 telegraphic messages to places within R., 470,000 to places abroad, and 373,000 official. In 1880, there were 7,300,000 messages.

Population.—The population of the empire is spread with great irregularity over the surface. In European Russia, its average is less than 37 per Eng. sq. m.; in the Caucasus, more than 25; in Siberia, 4; in Poland, 112; and in Finland, 14 per Eng. sq. mile. These figures, however, cannot be taken as a correct illustration of the actual distribution of the masses over the enormous surface

of the country; for, upon comparison, the degree of the density of the population of European Russia is found to vary greatly in the different governments. The government of Moscow contains 166 inhabitants per Eng. sq. m.; while that of Archangel contains only $\frac{1}{2}$. The central and south-west governments of this part of the empire are the most densely peopled. The town residents are 9 $\frac{1}{2}$ per cent. of the whole population of European Russia; 7 $\frac{1}{2}$ per cent. of that of the Caucasus; and 5 per cent. of that of Siberia. Russian society is divided into five classes, and of these the nobility forms 1.49 per cent.; the clergy (including their families) 1.01 per cent.; the bourgeois (tiers état), 8.60; the peasants, 82.55; and the military, 6.35 per cent. Irrespective of Asiatic and American Russia, we find that in Europe this empire comprises a greater variety of races than any other European state. It is not, however, like Austria, a composite community, speaking various idioms, and having different physical characteristics and political interests.

In European Russia, the predominant race is the Slavonian, and the Russian 'element' and language prevail almost universally. The 50,500,000 Russians who inhabit Europe are divisible into—1. Great Russians (33,935,000), inhabiting Central Russia. 2. Little Russians (12,015,000), located in the south-west. To the latter may be added the Cossacks (1,600,000), who are spread along the rivers Don, Kouban, Terek, Ural, Tobol, the Lake of Baikal, and the Amur. 3. White Russians (2,950,000), in the western provinces. The other Slavonic races are Poles (4,640,000), in the kingdom of Poland, and partly in the west provinces (where they form only 10 $\frac{1}{2}$ ths per cent. of the population); Servians and Bulgarians in Bessarabia and New Russia. The Finnish race (3,800,000), which occupies, under different names, the north and northeast of European Russia, and the north-west of Siberia, has in great part adopted Russian language and manners. The Lithuanians and Letts (2,460,000) dwell mostly between the Niemen and Dwina. The Turkish Tartarian race (5,700,000), in the south-east, and partly in Siberia, comprises Tchuvashes, Tartars of Kazan, Kirghiz, &c. The Mongols (376,000), comprising Kalmycks and other races in the south-east of European Russia, and in the east of Siberia. Besides these races, there are Roumanians and Walachs (770,000), in Bessarabia and New Russia; Persians, Kurds, Armenians, &c. (460,000), near the Caspian Sea; Germans (920,000), distributed over the whole empire, but found in the greatest numbers in the Baltic provinces; Swedes (200,000), in Finland; Greeks (52,000), in the south; Bohemians—i. e., Gipsies (50,000)—chiefly in Bessarabia; Jews (2,014,000), mostly in Poland and the west provinces; Caucasians (1,830,000), Samoids in the north of R., and many other tribes in East Siberia and Russian America.

Climate.—Owing to its vast extent, the Russian empire presents great varieties of climate. At Archangel, the mean temperature of the year is 32° F.; at Yalta, in the Crimea, 52°; and at Kutais, in the Caucasus, 58°. Consisting of an immense area of dry land, the climate of the empire is essentially continental; and the climate of localities in its interior is much more rigorous than that of places on the western shores of Europe in the same latitudes. The mean temperature of Edinburgh and Christiania is higher than that of Moscow and Kazan. The rigor of the climate of the empire increases not only with the latitude, but as you advance eastward; thus, the mean winter temperature of the town of Abo, on the Gulf of Bothnia, is the same as that of Astrakhan—viz., 23° F.; although the former is in lat. 61°, and the other in lat. 47°, or 14° nearer the equator. The difference of the mean summer temperature under the same latitudes is, on the contrary, not very considerable. The isothermal line of Astrakhan (60° F.) passes through Lublin in Poland and Ekaterinoslav. In the east, the maximum heat is even greater than in the west; and such heat-loving plants as the watermelon are grown more successfully in the south-east of R. than in the west of Europe, under the same latitude. The dryness of the atmosphere increases in the direction from north-west to south-east. On the banks of the Baltic, the average number of rainy and snowy days is 150, and the annual rainfall is 20 inches, while near the Caspian the number of such days is 70, and the rainfall only 4 inches. The climate of R. is in general healthy; but there are several places where diseases seem to be localized, as the shores of the Frozen Ocean, where scurvy is common, the marshes along the Niemen and Vistula, where the Plica Polonica (q. v.) is the chief disease, and the marshy lands on the Black, Azof, and Caspian seas, where ague always prevails.

Manufactures.—Manufacturing industry in R. may be said to date from the reign of Peter the Great. With a view to its promotion, foreign manufactured goods are heavily taxed on importation. In 1870, the number of factories (exclusive of iron-works and all establishments engaged in the preparation of metals) was 19,431, which employed 410,225 hands, and produced articles amounting to 373,000,000 roubles. Of these factories, a half were in the governments of St. Petersburg, Moscow, and Vladimir. The metallurgical works are mostly in the government of Perm,

and in other eastern governments bordering on the Ural Mountains. Small handicraft manufacturing establishments abound in all the central governments, especially in the neighborhood of Moscow, where whole villages during the winter season are employed in some special industry, as weaving, tanning, fur-dressing, joiners' work, shoemaking, &c. The chief manufacture is spinning and weaving flax and hemp. Linen is manufactured to the value of 100,000,000 roubles, chiefly in hand-looms; although the finer qualities are manufactured by power-looms, mostly in the governments of Jaroslav and Kostroma, and the capitals. Hemp is manufactured into sailcloth and ropes, which articles are largely exported. Woollen and worsted stuffs are made to the value of 50,000,000 roubles, and the quantity is on the increase. Fine cloths and mixed fabrics are made in the capitals, and in the governments of Livonia and Tchernigov. Silk-spinning and weaving are carried on in the factories of Moscow, which is renowned for its brocades, and gold and silver embroideries. Through the influence of the protective system, cotton spinning and weaving have been of late very rapidly extended. In 1870, there were 158 cotton-spinning mills, producing goods to the value of 53,350,000 roubles; and weaving establishments, to the value of 13,000,000 roubles.

After weaving, the next most important branch of industry is tanning, the products of which amount to 20,000,000 roubles. The other important branches of industry are cutlery, made in the town of Tula, the Russian Sheffield, and in the governments of Nijni-Novgorod, Vladimir, and Kostroma; and pottery and glass works, the former carried on in the government of Moscow, the latter in that of Vladimir. The produce of the machine factories in 1870 did not exceed 15,000,000 roubles; of the sugar-refineries 27,250,000 roubles; of the paper-mills, 5,750,000 roubles.

Commerce.—The Russian empire, including provinces varying widely in their natural and industrial resources, presents an extensive field for internal commerce, while the abundance of its products maintains a vast foreign trade. Of the former, which is by far the more important, the extent and value cannot be given, owing to the want of statistical data. Moscow, in the center of the industrial provinces of the empire, and the great dépôt for the wares that supply the trades of the interior, is the chief seat of the home-trade. The other large trading towns are chiefly those on the banks of the great rivers. The goods yearly conveyed by the Volga alone amount to 200,000,000 roubles. Owing to the distances between the great trading towns, fairs are still of great importance in Russia. The transactions of all the fairs in the empire amount to more than 300,000,000 roubles, and the chief are those of Nijni-Novgorod (q. v.), Irbis (q. v.), Kharkov (q. v.), Poltava (q. v.), and Kursk (q. v.).—The foreign trade consists mainly of the export of raw products and the imports of colonial and manufactured goods. The foreign trade by sea is five times greater than the trade by land; and of the latter, the commercial transactions with Europe amount in value to ten times the Asiatic trade. One-third of the whole foreign commerce is transacted at St. Petersburg, one-ninth at Odessa, and one-fifteenth at Riga. The principal exports from R. are as follows, in the order of importance: wheat, rye, flax, linseed, oats, wood, hemp, wool, barley, cattle, maize; also unwrought metal, bristles, tow, leather, tarrow, oil, fur, caviare. The chief imports: raw cotton, engines and machinery, wool, tea, cotton yarn, chemicals and drugs, coal and coke, wrought iron, wine, metal wares, non-mineral oils, fruit; also petroleum, salt, tobacco, linen, indigo, glass-ware, coffee, books. (Raw sugar used to be a chief import, but the development of the beet-sugar manufacture has reduced the imports to a very small quantity since 1878.) The exports are sent mostly to Britain, next to Germany, then, at a great interval, to France, Austria, Holland, Belgium, Turkey; the imports are mostly from Germany, and next Great Britain, then from Austria, France, Turkey, South America, and the United States. Between 1871 and 1881, the value per annum of the total exports varied from £55,850,000 (1871) to £96,015,000 (1879); and the total imports, from £54,557,000 (1871) to £91,570,000. The exports to Britain decreased from £24,320,000 (1872) to £14,053,000 (1881); the imports from Britain were £9,000,000 in 1873, and only £6,165,000 in 1881. Exports to Germany were about £23,000,000 in 1880, and imports thence, £45,800,000. Of the total exports to Britain in 1881, the northern ports of R. sent a value of £11,230,000, while the southern sent goods to the amount of £3,825,000. In 1880, the number of vessels that entered the ports of R. was 15,358, and of these 2746 were Russian, 2660 English, 2573 German, 2047 Swedish and Norwegian, 1380 Turkish, 1088 Greek, 892 Danish, &c. The commercial marine of R. is as yet not much developed. In 1880, it comprised 2580 sea-going vessels, of an aggregate burden of 523,000 tons, besides 390 trading steamers on rivers and lakes.

Geology and Mineral Products.—A more intimate knowledge of the geological structure of R. may be said to date from 1841, when the eminent geologist Sir R. I. Murchison, undertook a

scientific journey to R. and the Ural Mountains. His geological investigations, together with the palæontological researches of his colleagues, E. de Verneuil and Count Kayserling, have served as a basis for further surveys. The oldest stratified rocks are the Silurian, on the southern shores of the Gulf of Finland, sinking down below the Devonian strata, which run in two large branches—on the south-east to Voronezh, and on the north-west to Archangel, both overlaid to the east by a still more extensive deposit of carboniferous rocks. The immense triangle between those layers and the Ural is occupied by the Permian system (except the north-east extremity, which is covered by Jurassic beds), named by Sir R. I. Murchison from its development in the government of Perm. To the south of the south-east Devonian branch extend deposits of the cretaceous period, and detached patches of the carboniferous formation. The latter contains, in R., only the older members of the group up to the mountain limestone, which contains numerous but thin seams of coal, generally poor in quality.

The field along the Donetz forms an exception, and yields annually about 96,400 tons (§his of the total quantity raised in R.) of good coal and anthracite. The remaining south-west and south-east parts of the empire are covered by tertiary beds, more or less recent. The Ural Mountains present an outcrop of all the secondary and palæozoic formations down to the stratified gneiss and granite, which latter composes nearly the whole province of Finland, and skirts the middle course of the Dnieper. The Ural Mountains (q. v.), which contain almost all the mineral riches of the country, are the principal seat of mining and metallurgical industry. They produce gold, platinum, copper, and iron of excellent quality, especially the last, which is manufactured from magnetic ore. Emeralds, sapphires, amethysts, agates, rhodonites, rock crystal, jasper, chrysoberyl, and black tourmalin are also found, as well as diamonds of an inferior quality. Gold, silver, copper, plumbago, &c. are also obtained from the Altai and Nerchinsk mines in Siberia (q. v.). A few years ago, the annual produce of the mines amounted to £12,000,000; the chief items being gold, silver, platinum, copper, lead, and iron. Salt is obtained to the annual value of 14,000,000 roubles, chiefly from salt lakes in Bessarabia and the Crimea, from Lake Elton in Astrakhan, and from the inexhaustible layers of rock-salt near Iletzk (q. v.). There is much diversity of opinion as to the total amount of coal available in Russia, the coal-bearing area never having been thoroughly explored; but some good authorities say the coal supplies of R. are more extensive than those of any other European country. The total produce of coal from all the Russian mines in 1874 amounted to 83,575,000 puds (pud = 36 lbs. avoird). Excellent china-clay or kaolin is found near Gluchov, in the government of Tchernigov.

Agriculture and Products.—R. is an eminently agricultural country, although only a comparatively small portion (271,000,000 acres) is under cultivation. In the central zone (see above, under *Surface*), the soil is almost entirely black mould, extremely fertile, and hardly ever requiring manure. The system of husbandry most extensively practised is what is called the 'three-field system,' in the working of which, one-third of the land is always in fallow. In the south and south-east, a system of agriculture peculiar to R. is in operation: it is called the 'fallow system,' and consists in raising three or four consecutive crops from the same land, and afterwards allowing it to lie fallow for five or six years, after which time it begins to grow feather-grass (*Stipa pennata*), which is considered a token of returning fertility. Husbandry, in general, has undergone great changes since the emancipation of the serfs, to whom a considerable portion of the land has been transferred in freehold. The landowners, deprived of their former right to the labor of their serfs, now find it more profitable to reduce the amount of their land in cultivation, or grant portions of it in lease to the peasants, often in return for the half of the produce of the crop. A great drawback to the development of agriculture is the want of proper means of communication, and consequently the low price of corn in the locality in which it is grown. Fodder-grass is rarely cultivated, as a sufficient supply of fodder is afforded by the extensive natural meadows. The chief cereals are wheat—which is grown as far north as lat. 62°—rye, barley, and oats. Buckwheat and millet are grown in the south, and from these, but specially from rye, the staple food of the inhabitants is made. Hemp and flax are extensively cultivated; and the oil extracted from the seeds of the former is an indispensable article of the peasant's household, as it is used for food during the fasts, which, taken together, extend over about half the year.

Of flax, 15,000,000 puds are annually produced; of hemp, 7,000,000 puds, and 3,000,000 puds of oil-seeds. After the famine of 1859, government introduced, and afterwards did much to promote the cultivation of potatoes. The yearly produce of this crop amounts to 55,000,000 *tchetverts* (1 *tchetvert* = 5.77 imp. bushels). Tobacco crops cover 16,000 acres, and the amount produced is 2,500,000 puds. Beet-root and maize are also cul-

tivated; and there are numerous vineyards in the Crimea, in Bessarabia, and along the Don. Gardening is an important branch of industry, the products being cucumbers, onions, cabbages, and other vegetables and fruits. An area of 527,000,000 acres is covered with woods, but the quantity of timber, from which material the peasant supplies almost all his wants, is at present suffering diminution. The Russian builds his cottage with timber, heats his room with it, lights his house with firewood, makes his household utensils from the same material, as well as his cart, &c.; he also wears shoes, and uses mats for coverings, which are made from the inner bark of the lime-tree. In the north, the forests occupy from 90 to 95 per cent. of the whole surface; in the south, they are 2 per cent. less than in England. Coniferous trees are the chief in the northern districts; but in the central tracts, oaks, limes, maples, and ashes are the chief. Timber is the chief article of internal commerce, and is floated down the rivers from the well-wooded districts to those which are destitute of wood.

Animals and Animal Products.—In the northern and central provinces, cattle are kept chiefly for the purpose of obtaining manure; but in other parts, cattle-breeding is an important branch of industry. On an average, there are 30,000,000 head of cattle in Russia. Of horses, the best, chiefly trotters, are reared in breeding stables in the southern central governments; but the great bulk of the horses are obtained from the half-wild studs of the Cossacks, Kalnucks, and Kirghiz. The horses of Viatka, Kazan, and Finland are strong and hardy. The total number of the horses in R. is about 18,000,000. Sheep-breeding is carried on extensively on the southern steppes. The sheep number 50,000,000, of which upwards of 1,000,000 are of the fine merino breed. Besides these animals, there are camels in the south of R., reindeer in the north, and hogs and poultry in great abundance everywhere. A breed of the *Urus* (q. v.), a huge and rare animal, which does not occur in any other country, is preserved in a forest of the government of Grodno. Among the wild animals are (chiefly in the north), the bear, wolf, elk, fox, and marten; on the northern coasts, are found the seal and walrus, and the eider-duck and other wild-fowl. The more expensive kinds of furs are procured from Siberia. The most important Russian fisheries are those of the Caspian and Black Seas, and the Sea of Azov, and their tributaries. The lake fisheries are also very valuable. Herrings, cod-fish, and salmon are caught in abundance in the White Sea, and are the main source of livelihood to the inhabitants of those regions. The value of the Russian fisheries is estimated at about £2,000,000 annually. Bee-culture is very general in R., and silk-worms are reared in the Caucasus.—See the statistical works of Saranw (1873); Von Lengenfeldt (1875); Wilson (St. Petersburg, 1876); also *Russia*, by D. Mackenzie Wallace (1877); *Russia*, by W. R. Morfill, 1880.

History.—Copious histories of R. are numerous, those of Karamsin, Solovief (1851-77), and Schuitzer (German transl. 1874), being standard Russian works. More accessible are Turgenief, *La Russie* (Par. 1847); Rambaud, *Histoire de Russie* (Par. 1878).—The population of the Russian empire is composed of various nationalities, but the predominant one is the Slavonic (q. v.). The Eastern Slavs, the ancestors of the Russians, were settled near the sources of the rivers Volkhoi, Bug, Dniester, Dnieper, and Don, and consisted of several tribes whose chief towns were Novgorod and Kiev. Being much harassed by their warlike neighbors, and distracted by intestine dissensions, the Slavs of Novgorod and the neighboring Finnish tribes, in 862, sent ambassadors to 'the Variags (Varangians, Normans) beyond the sea,' inviting their chiefs to come and reign over them. Three brothers of the tribe, called by the old chroniclers *Rurik* (q. v.), Sineous (Sindf), and Truvor, accepted the invitation, and at the head of a band of armed followers (*droujina*) took possession of the territory of Novgorod. Oleg (879-912), who exercised authority as regent to Igor, Rurik's son, took Kiev, and made it the capital of the embryo empire, subduing the neighboring tribes, and even successfully attacking the Byzantines. Igor (912-945) did nothing of note, but his widow and successor *Olga* (945-957), was a wise and able ruler. She was baptized in 955 by the patriarch of Constantinople, and abdicated soon after in favor of her son *Sviatoslaf* (957-972), a warlike monarch and a pagan, who was treacherously murdered by a neighboring tribe with whom he was at war. On his death, the principality was divided among his three sons, and the quarrels usual in such cases followed, and continued till *Vladimir* (980-1015), the youngest son, became sole ruler. The Normans now definitively became amalgamated with the Slavonic race.

Vladimir's reign is the 'heroic' epoch of Russian history; and the glories of the court, and the valiant feats of the warriors of the 'sunny Prince Vladimir,' have been handed down through ages in legend and song. His successful wars extended the boundaries of R. to Lake Ilmen on the north, to the mouths of the Oka and of the Khoper (an affluent of the Don) on the east, to the falls of the Dnieper on the south, and to the sources of the

Vistula on the west. He became a convert to the Greek faith, and in 988 was baptized with his followers; his example being shortly followed by the whole nation, for whose spiritual guidance and supervision a metropolitan was established at Kiev. He followed the evil example of his father in dividing his dominions, and after his death a civil war broke out among his four sons, in which *Jaroslav*, prince of Novgorod, was ultimately (1036) successful. This prince did much to civilize his subjects by building towns, founding schools, and especially by ordering the compilation of the first Russian code of laws (the 'Rousskaja Pravda'), the most prominent item of which was the limitation of the right of family feud, a limitation which was changed into total abolition after his death in 1054, by his sons, who shared the principality among them. Each of these petty princes in turn divided his portion of territory among his sons, till the once great and united realm became an agglomeration of petty states quarrelling with each other, undergoing absorption by a more powerful neighbor, or being redivided. This state of anarchy, confusion, and petty warfare dates from the death of *Jaroslav* in 1054, and continued, more or less, till 1478.

The principal among the subdivisions of R. during this period were, according to Russian authorities, *Soudal*, which occupied the upper and central parts of the basin of the Volga, and from which, in the beginning of the 13th century, sprang the principalities of *Tver*, *Rostof*, and *Vladimir*; *Tchernigof* and *Seversk*, which occupied the drainage-area of the Dnessa (an affluent of the Dnieper), stretching to near the sources of the Oka; *Riazan* and *Murom*, along the Oka basin and the sources of the Don; *Polotsk*, including the basins of the Western Dwina and Beresina; *Smolensk*, occupying the upper parts of the basins of the Western Dwina and Dnieper; *Volyhnia* and *Galicja*, the first drained by the Pripet, the second lying on the north-east slope of the Carpathian Mountains, which were united in 1198; *Novgorod*, by far the largest of all, which occupied the immense tract bounded by the Gulf of Finland, the Lake Peipus, the upper parts of the Volga, the White Sea, and the Northern Dwina; and the grand-duchy of *Kief*, which, from its being formerly the seat of the central power, exercised a sort of supremacy over the others. Novgorod, however, from its size and remoteness, as well as from certain privileges which had been granted to it by *Jaroslav*, was almost independent of the grand-duchy. The citizens of Novgorod chose their own dukes, archbishops, and in general all their dignitaries, and proved the superiority of their system of self-administration by increasing in power and wealth year by year. One of the chief factories of the great Hanseatic League was established in Novgorod in the 13th century. In fact, so great was its fame throughout R., as to give rise to the proverb, 'Who can resist God and the mighty Novgorod.' The princes of these states had each his standing army, and were continually quarrelling; but the people were less oppressed than would naturally be expected under such circumstances, on account of the establishment in each state of a 'common council' or *veche*, which exercised an important influence in state affairs, and without which the prince was almost powerless. This period was also marked by the gradual amalgamation of the different Slavic races into one, the present Russian race, a process doubtless aided by the universal dissemination of Christianity, which assimilated their various languages, manners, and customs.

The chief of the grand dukes of Kiev were *Vladimir*, surnamed 'Monomachus' (1119—1125), whom chroniclers are never tired of lauding as a model prince, and one whose authority was acknowledged almost as paternal by the princes of the other provinces. In 1163, the ruler of Vladimir took possession of Kiev, and proclaimed himself grand duke. In 1222, the Mongol tide of invasion had swept westwards to the Polotzes, a nomadic tribe who ranged over the steppes between the Black Sea, and the Don, and whose urgent prayers for aid were promptly complied with by the Russian princes; but in a great battle, fought (1223) on the banks of the Kalka (a tributary of the Sea of Azof), the Russians were totally routed. The Mongols, as usual, did not follow up their victory; but twelve years afterwards, Batü Khan, at the head of half a million of Kiptchak Mongols, conquered the east of Russia, destroying Riazan, Moscow, Vladimir, and other towns. The heroic resistance of Prince George of Vladimir cost the lives of himself and his whole army on the banks of the Siti. The Mongol conqueror's victorious career was, however, arrested by the impenetrable forests and treacherous marshes to the south of Novgorod, and he was forced to return to the Volga. In 1240, he ravaged the south-west, destroying Tchernigof, Galich, and Kiev; ravaged Poland and Hungary, defeating the Poles at Wahlstatt, and the Hungarians at Safo; but being checked in Moravia, and receiving at the same time the news of the khagan's death, he retired to Sarai on the Akhtuba (a tributary of the Volga), which became the capital of the great khanate of Kiptchak. Thither the Russian princes repaired to swear allegiance to the khan, and take part in the humiliating ceremonies which the barbarous conqueror exacted from his tributaries. The taxes of R. were farmed out

by the khan to contractors, who were generally oriental merchants, and they were collected by the aid, when necessary, of the khan's soldiers. But in later times (during the most of the 14th and 15th centuries), when the fiery energy of the Mongols was on the decline, the taxes were collected by the Russian princes and sent to Sarai.

The Mongol invasion had an evil influence on the political, social, and moral life of R.; it totally destroyed the elements of self-government, which had already attained a considerable degree of development, arrested the progress of industry, literature, and the other elements of civilization, and threw the country more than 200 years behind the other states of Europe. The principalities of Kiev and Tchernigof never recovered this crushing blow, and the seat of the metropolitan was removed to Vladimir. Their decline, however, made room for the rise of Galich to pre-eminence in Western R., and under the rule of a series of wise princes it preserved greater independence than any of the Russian principalities, till, in the latter half of the 13th c. it was taken possession of by Kasimir III. of Poland; and about the same time Volyhnia was joined to the grand duchy of Lithuania. The rise of this latter state was much favored by the prostration to which the Russian princes were reduced by the Mongol invasion, and after a flourishing existence of several centuries, during which it extended in power, so as to include Livonia proper, and the Russian provinces of White R., Volyhnia, Podolia, and the Ukraine, it was joined in 1569 to Poland. On the north of Lithuania arose in the beginning of the 13th c. another power, the Livonian Knights, sword-bearers, who took possession of Livonia, Courland, and Esthonia, as well as some portions of the territory of Novgorod and Pskov. The grand-ducal title passed after the Mongol invasion from Kiev to Novgorod, and afterwards to Vladimir, where the celebrated Alexander Newski (q. v.) (1252—1263) swayed the sceptre.

In the beginning of the 14th c., Eastern R. consisted of the principalities of Soudal, Nijni-Novgorod, Tver, Riazan, and Moscow, and long and bloody contests took place between the two most powerful of these, Tver and Moscow, for the supremacy. At last, under the guidance of *Ivan Kalita* (1328—1340), the founder of the system of administrative centralization which prevailed down to the time of Peter the Great, Moscow became the chief grand-duchy. This result was due to various causes, of which the central position of Moscow, the prevalence there of the law of primogeniture, the favor of the Mongol khan, the sympathy of the church, whose head the metropolitan had removed thither from Vladimir in 1325, and the weakness of most of the other princes, were the chief. Ivan's son and successor, *Simeon the Proud* (1340—1353), followed in his father's footsteps, as did also the regency which administered the government during the reign of the weak-minded *Ivan II.* (1353—1359), and the minority of his son, *Dmitri* (1359—1389). Dmitri conquered Nijni-Novgorod, carried on war with success against Tver and Riazan, and profited by the weakness of the Mongol khanate, which was now divided into the four hordes of Nagaisk, Crimea, Kazan, and Astrakhan, to make the first attempt to shake off the shameful yoke under which the Russians had groaned so long. His brilliant victory over the Khan Mamai on the banks of the Don (1380), which conferred on him the epithet of *Donskoï*, was the first step to liberation; but the succeeding khan, in revenge, burned Moscow, exacted a heavy tribute from the people, and riveted their bonds more firmly than ever. *Vassili I.* 1389—1425 obtained possession of the principality of Nijni-Novgorod with the full consent of the khan, and conquered Rostof and Murom. During his reign, R. was twice invaded by the Tartars, first under Timur, and again under Edigei, and was at the same time attacked by the Livonians.

Vassili II. the Blind (1425—1462) reigned during a period marked with continual civil wars among the various princes for the grand-ducal throne; but from this period the division of power in Eastern R. rapidly disappeared, internal troubles ceased, and the reunited realm acquired from union the power of casting off the Tartar yoke. These results were achieved by *Ivan III.* (1462—1505), surnamed 'the Great,' who availed himself of every opportunity for abolishing the petty principalities which owed him allegiance as grand-duke, and manoeuvred so skillfully, that some of the princes voluntarily surrendered their rights, others bequeathed their lands to him; while others, as the prince of Tver, were reduced by force of arms. The heaviest task of all, however, was the reduction of Novgorod, but so vigorously did Ivan carry out his schemes, that in 1478 this last of the great principalities was added to his empire. He then took advantage of the dissensions between Achmet, khan of the Golden Horde, and Mengli-Gherai, khan of the Crimean Horde, to deliver R. from its state of servitude by uniting with the latter; their combined arms destroying the power of the former in 1480; and the kingdom of Astrakhan, which rose on its ruins, was wholly unable to cope with the now powerful monarchy. He next turned his attention to the western provinces, which had formerly belonged to the descendants of St.

Vladimir, but were now in the hands of the Lithuanians, under whom the adherents of the Greek Church were bitterly oppressed by the Catholics, and accordingly hailed the advance of Ivan's army as a deliverance from persecution. The battle which followed was in favor of the Russians, but was productive of no results of any importance. Ivan married (1472) Sophia, a niece of Constantine Paleologus, the last Byzantine emperor, and introduced the arts of civilization through the medium of architects, founders, coiners, miners, &c., whom he brought from Italy, and the result of whose labors are seen in the Kremlin and the Cathedral of the Assumption (Ouspenski Sobor). He also fortified many towns, introduced to his court the splendor of Byzantium, assumed the title of Czar of all the Russias, adopted the arms of the Greek empire, and united the existing edicts into a body of laws, the *Soudebnik*.

Vassili III. (1505—1533) followed closely his father's policy, made war upon the Lithuanians, from whom he took Smolensk, and incorporated with his dominions the remainder of the small tributary principalities. His son, *Ivan IV.* (1533—1584), known afterwards as 'The Terrible,' became monarch at the age of three years, and the country during his long minority was distracted by the contentions of factious bojars who strove for power. Fortunately, however, on his attaining his majority in 1547, he found two wise and prudent counsellors, Sylvestre and Adascheff, who, along with his queen, Anastasia Romanoff (see ROMANOFF), exercised over him a most beneficial influence. The interior administration was remodelled, the 'soudebnik' of his grandfather was reformed and amended, the *streletzi*, the first standing army in R., were established, and printing introduced. His arms were everywhere victorious; the strongly fortified city of Kazan was captured in 1552, and the kingdom of which it was the capital was annexed to his empire, and the kingdom of Astrakhan shared the same fate soon after. The marauding Tartars of the Crimea were held in check, and the Knights Sword-bearers attacked and driven from Livonia and Esthonia. About this time a remarkable change came over Ivan's character, which seems to have been in some way connected with the death of his wife, Anastasia. He became suspicious of every one, believed himself surrounded with traitors, banished his two counsellors, Sylvestre and Adascheff, and persecuted the bojars, many of whom perished on the scaffold, while others fled to foreign countries. His insane rage fell upon whole towns; thousands of people were destroyed in Tver, Novgorod, and Moscow; and, finally, he murdered his eldest son, Stephen Batory, king of Poland, meantime wrested Livonia from him, and the Crim-Tartars made an irruption northwards, and burned Moscow. It was during the reign of this monarch that Western Siberia was conquered for R. by the Cossack Ermak. See SIBERIA. His son, *Feodor* (1584—1598), was a feeble prince, who intrusted his brother-in-law, Boris Godounof, with the management of affairs.

Godounof was a man of rare ability and intellect, and proved himself an able administrator. The Russian dominion in Siberia was consolidated, numerous towns and fortresses were erected in the south as barriers against the Crim-Tartars, the Greek Church in R. was declared independent of the patriarch of Constantinople. Feodor was the last reigning monarch of the house of Rurik, for he died childless, and his only brother, Dmitri, was murdered in 1591 by order of Godounof, according to popular rumor. After the death of Feodor, representatives of all classes were convoked at Moscow to elect a new sovereign, and their choice fell on *Godounof* (1598—1604). The mysterious death of Prince Dmitri favored the appearance of pretenders to his name and rank, the first of whom, a supposed monk of the name of Gregory Otrepieff (see DEMETRIUS), was defeated by Godounof, but on the sudden death of the latter he was crowned in 1605. A revolt, headed by Prince *Vassili Shouisky* (1606—1610) soon broke out, the czar was murdered, and Shouisky elevated to the vacant throne. But a second false Dmitri now appeared, and Sigismund of Poland, taking advantage of the confusion thus produced, invaded R., proclaimed his son Vladislav czar, and took possession of Moscow (1610), carrying away the czar to die in a Polish prison. At the same time hordes of Tartars, predatory bands of Poles, and gangs of robbers devastated the provinces and the wretched country was reduced almost to the verge of complete disorganization. But the clergy nobly stood forth to save the state from ruin, and Minin, a common citizen of Nijni-Novgorod, so worked up the feelings of his fellow-citizens that they volunteered for military service, and chose as their leader the Prince Pojarsky, a man of distinguished valor. Pojarsky retook the capital, drove the Poles out of R., and convoked an assembly of representatives, who unanimously chose for their czar *Michael Feodorovitch Romanoff* (1613—1645). See ROMANOFF.

The first cure of the new monarch was to put an end to the revolt of the Don Cossacks, who had set up the son of the first false Dmitri as czar, and to the depredations of the robber-gangs in the south-west of Russia. In 1617, he concluded a treaty with Sweden, by virtue of which that power received the coasts of the

Gulf of Finland and a considerable pecuniary indemnity, in consideration of Philip, the brother of the Swedish monarch, renouncing his claims to the Muscovite throne. In 1618 and 1634, he purchased peace from the Poles at the cost of Smolensk and a portion of Seversk. Having thus freed himself from all danger of foreign interference, he directed his attention to the internal administration, which, especially the courts of justice, was reduced to a deplorable condition, and to aid him in this necessary task, he summoned a general council of representatives at Moscow. *Alexei* (1645—1676), his son and successor, being a minor, the nobles seized the opportunity of increasing their power and exercising oppression and extortion over their inferiors, till rebellions broke out in various districts. Other causes of discontent were the heaviness of the taxes, the oppression of the serfs, the depreciation of the currency, which was changed from silver to copper, and the secession from the Russian Greek Church of those who disapproved of the changes and corrections in the books and liturgy of the church introduced by the patriarch Nikon. These malcontents were accordingly persecuted, and fled, some to the north of R., and others to the Ukraine, where they founded many colonies, and still exist apart under the name of 'Old Ritualists' (*Staro-obryadzy*). A general council, which was now convoked to deliberate on the best means of restoring peace to the country, revised the existing laws, and composed (1649) a new code—the 'Sobornoe Ulozhenie,' which granted to every subject the right of direct appeal to the czar. Tolls on the highways were abolished, the English and other foreign merchants were deprived of their privilege of free-trade with R., and the silver currency reintroduced.

The chief events in foreign policy were the acquisition of Little Russia, by the voluntary submission of the Cossacks (see POLAND); a consequent war with Poland, in which R. acquired Smolensk and the greater part of White Russia; and a war with Turkey, which continued till after the accession of *Feodor* (1676—1682), when it was terminated (1681) by the treaty of Bakhtchisarai, by which Turkey gave up all claims to Little Russia. After Feodor's death, the general council of the land, in accordance with his last wishes and their own predilections, chose his half-brother Peter as czar, but his half-sister Sophia, an able and ambitious princess (see PETER THE GREAT) succeeded in obtaining the reins of power as princess-regent. She concluded peace with Poland in 1686, made two unsuccessful campaigns against the Tartars of the Crimea; and after an attempt to deprive Peter of his right to the throne, and failing this, to assassinate himself and his mother, she was forced to resign all power and retire to a convent. All her accomplices were executed; and PETER (1689—1725) ascended the throne as sole ruler, his half-brother Ivan being allowed to retain the title of czar conjointly, and to appear as such at public ceremonies, but without any real authority. In order more fully to discover the importance of the changes wrought by Peter in R., a brief retrospect of its social and political condition at the date of his accession is necessary. At the head of government stood the czar with absolute power in administrative, judicial, and military affairs.

In the exercise of authority he was aided by his council, the 'Bojarskaia Douma,' and in cases of extreme need by a general council of representatives of the people, which latter, however, possessed only a right of deliberation. The criminal code was cruel in the extreme. Of the standing army the *streletzi* only deserved the name. The population were divided into two great classes, the *bojars* or nobles, who were bound to render service for their estates, and the *burghis* or industrial and trading classes, and *serfs*, who were bound to the soil.

The clergy exercised great influence over all classes, possessed offices in the 'douma,' and exercised political functions. Agriculture was at a low ebb, and the few manufactories and industrial establishments were in the hands of foreigners. Civilization and learning, which had been introduced during the confederate period, had never recovered the shock they had received from the Mongol invasion, but in later times they entered R. through the connection of Novgorod with the Hanse League, and from intercourse with Poland, though they never reached the rural population or the lower classes. The education even of the higher classes was limited to reading and writing, and the first school for classics and theology only made its appearance during Feodor's reign. Fine arts were limited to architecture and painting (of sacred subjects) after the Byzantine school. The first newspaper appeared (in Moscow), and the first theater was established during the reign of Alexis. The degraded condition of civilization and the Oriental influence of the Mongols left powerful traces on the domestic manners and habits of the Russians, among which was the despotic authority of the father over his household, and the low position of women in domestic life; those of the lower ranks being made mere slaves, while those of higher rank were completely excluded from social intercourse with the other sex, and were condemned to pass a dull and dreary existence in their 'terems.' Marriages were concluded by the parents without the consent of the bride and bridegroom.

The history of R. during Peter I.'s reign is merely a biography of that monarch, and under his name is given a brief sketch of the numerous and important improvements effected by him in the government and civilization of his subjects. It must, however, be noted, that in the carrying out of his well-meant schemes, he seldom consulted the national character of his people, or the natural conditions of the country; and consequently, when the irresistible pressure of his high intellect and indomitable will was withdrawn, it was found that, in great part, the civilization which he had forced upon his subjects was but skin-deep. In accordance with the terms of his will, his second wife, *Catharine I.* (q. v.) (1725—1727), succeeded him, though the old or anti-improvement part of the nobility supported the claims of the only son of the unfortunate Alexei (q. v.), *Peter II.* (q. v.) (1727—1730), who soon after obtained the imperial throne. The reigns of both of these sovereigns were occupied with court quarrels and intrigues, *Menchikow* (q. v.) during the former, and *Dolgorouki* during the latter, being the real rulers. On the death of Peter II., the privy council, setting aside the other descendants of Peter I., conferred the crown on *Anna* (q. v.), Duchess of Courland, the daughter of Ivan. Her reign (1730—1740) was marked by the predominance of the German party at court, who, unchecked by the weak sovereign, treated R. as a great emporium of plunder, and the Russians as barbarians (see *BIRON*). Under their influence, R. restored to Persia her lost Caspian provinces, and was led into a war with Turkey, which was productive of nothing but an immense loss of men and money. Her successor was *Ivan* (1740—1741), the son of her niece, the Duchess of Brunswick, *Anna Carlovna* (q. v.); but he was speedily dethroned by *Elizabeth* (q. v.) (1741—1762), the daughter of Peter I., who deprived the German party of the influence it had so shamefully abused, restored the senate to the power with which it had been intrusted by Peter the Great, established a regular system of recruiting, abolished tolls, and increased the duties on imports.

During her reign, French influence was paramount, and the language of that nation supplanted German at court. R. gained by the treaty of Abo (1743) a portion of Finland, and took part in the *Seven Years' War* (q. v.). Elizabeth's nephew and successor, *Peter III.* (q. v.) (1762—1762), put a stop to all interference with the quarrels of Western Europe, and introduced some commendable ameliorations of the oppressive enactments of his predecessors; but he was speedily dethroned by his able and unscrupulous consort, who, as *Catharine II.* (q. v.) (1762—1796), ascended the throne, and proved herself the greatest sovereign of R. after Peter I. Her successful wars with Turkey, Persia, Sweden, and Poland, largely extended the limits of the empire; and while by her foreign policy protecting her subjects from external invasion, she as little forgot the necessity for internal reforms. The laws and administrative arrangements were revised, and the empire was divided into governments (an arrangement which, with very slight modification, still subsists), each government being under a separate administration, both as to matters of polity and justice. Her son and successor, *Paul I.* (q. v.) (1796—1801), at first, through apprehension of the revolution in France, joined the Austrians and British against France, but soon after capriciously withdrew, and was about to commence war with Britain, when his assassination took place. He gave freedom of worship to the 'Old Ritualists,' which till this time had been withheld; but he also established a severe censorship of the press, prohibited the introduction of foreign publications, and organized a secret police. His eldest son, *Alexander I.* (q. v.) (1801—1825), was at the outset desirous of peace, but was soon drawn into the vortex of the great struggle with France, in which he played a prominent, although at one period an inconsistent, part, and raised R. to the first rank among European States. The character of his rule and the internal improvements he effected are sketched under his name; and an outline of the warlike operations is given in the article *NAPOLEON*.

The Holy Alliance (q. v.) and the example of conservative policy set by Austria, exercised a pernicious influence on the latter part of his reign; and the higher classes, who had looked for the introduction of at least a portion of the liberal institutions they had seen and admired in Western Europe, became so dissatisfied, that when his youngest brother, *Nicholas I.* (q. v.) (1825—1855), from whom they had nothing to hope, succeeded, they broke out into open rebellion, which was speedily crushed. A full stop was now put to the rapid advance of R.'s prosperity; wars were declared with Persia and Turkey; and a long and deadly struggle commenced with the Caucasian mountaineers—all for the ill-concealed object of extending Russian domination; and the cession of Erivan and Nahituvan by Persia, of the plain of the Kuban, of the protectorate of the Danubian principalities, and of the free right of navigation of the Black Sea, the Dardanelles, and the Danube by Turkey, only whetted his appetite for more spoil. In 1830, he converted Poland (q. v.) into a Russian province; in 1849, he officiously aided Austria in quelling the insurrection of the Magyars; and in 1853, his almost irresistible

craving for more territory led him (being, in all probability, under the impression that Turkey would stand alone, as she had always done hitherto) into the Crimean war, in which, though the allies, Britain, France, and Sardinia, did not obtain any decided success, R. suffered immense loss of military prestige on the Danube, at Silistria, the Alma, and before Sebastopol, and was almost drained of her vast resources of men and money. The accession of Nicholas's son, *Alexander II.* (1855)—one of whose first acts was the conclusion of the peace of Paris (1856), by which R. lost the right of navigation on the Danube, a strip of territory to the north of that river, and the unrestricted navigation of the Black Sea—has been the signal for the revival of those schemes of reform which had been crushed so despotically by the late czar. Alexander's first great reform was the abolition of serfdom, which created 14 millions of new free citizens. Corporal punishment, and the farming-system of the indirect taxes, were also abolished; and the judicial power was separated from the administrative, and founded on trial by jury.

The insurrection in Poland (q. v.), in 1863—1864, was suppressed with extreme severity; and in 1868 the last relics of Polish independence disappeared in the thorough incorporation of the kingdom with the Russian Empire. The subjugation of the Caucasus was completed in 1859. Successive expeditions, the last of which were those against Khiva and Khokan, have resulted in the establishment of Russian supremacy over all the states of Turkestan. In 1876, on the death of the Governor-general of the Baltic Provinces, their administration was merged in that of the central government. R. in 1870 intimated that she no longer felt bound by certain conditions of the Treaty of 1856, and in a conference at London in 1871 her claims were admitted. The misgovernment of her Christian subjects by Turkey, and her cruel suppression of incipient rebellion in Bulgaria in 1876, led to a conference of the European Powers at Constantinople. Turkey rejected the proposals made by the conference with a view to the better administration of the subject provinces; and R., to enforce these concessions on Turkey, declared war in April 1877. At first the Russian progress was rapid; but the energy displayed by the Turks during the summer compelled the invaders largely to augment their forces both in Bulgaria and in Armenia. The chief events in the war were the desperate but unsuccessful attempts to expel the Russians from the Shipka Pass in the Balkans, the fall of Kars in November, the resolute defence of Plevna by Osman Pasha from July till December, and the capture of the Turkish army of the Shipka in January. The armistice signed in Jan. 1878 was followed in March by the treaty of San Stefano; and after diplomatic difficulties that seemed for a time not unlikely to issue in war between R. and England, a Congress of the Great Powers met at Berlin in June 1878, sanctioned the re-arrangement of the Ottoman empire explained under the article *TURKEY*, and the cession to Russia of the part of Bessarabia given to Moldavia in 1856, as also of the port of Batum, of Kars, and of Ardahan. The growth of Nihilism (q. v.) and revolutionary discontent, leading to severe repressive measures, has been marked by many murderous outrages, culminating in the assassination of Alexander II., in 1881.

RUSSIAN CHURCH, the community of Christians subject to the emperor of Russia, using the Slavonic liturgy, and following the Russian rite. Christianity was introduced into Russia in the 9th c. (see *OLGA*); but it was not till the end of the 10th that the foundation was regularly laid. In the great schism between the churches of Constantinople and Rome, the R. C. naturally followed silently in the train of Constantinople, yet, at the time of the Council of Florence (1439), the adherents of the Roman Church throughout Russia were as numerous as those of the Greek party. The complete separation of the R. C. from Rome was effected in the latter part of the same century.

For more than a century from this date, the R. C. continued directly subject to the patriarch of Constantinople; but in the year 1588, the patriarch Jeremias being in Russia, held a synod of the Russian bishops, and erected the see of Moscow into a patriarchate, with jurisdiction over the entire territory; this decree being afterwards confirmed by a synod held at Constantinople. This dignity, however, was subordinate to the patriarch of Constantinople, and the subordination was acquiesced in down to the reign of Alexis Michaelowitz, father of Peter the Great, when the patriarch of Moscow, Nikon, refused to acknowledge it further. The pretensions of this prelate, and of his successors, however, gave offence to the czar, and one of the first among the great schemes for the reorganization of his empire, conceived by Peter the Great, was the direct subordination of the church to the headship of the emperor. On the death of the patriarch Adrian, in 1700, he did not fill up the vacant dignity, but appointed in the meantime as acting director of ecclesiastical affairs a bishop, with the title of Exarch. After an interval of 20 years, the public mind having been taught to forget the patriarchate, that office was formally abolished in 1721; and the permanent

administration of church affairs was placed under the direction of a council, called the 'Holy Synod,' or 'Permanent Synod,' consisting of archbishop, bishops, and archimandrites, all named by the emperor.

Under the direction of this council, a series of official acts and formularies, and catechetical, doctrinal, and disciplinary treatises was drawn up; by which the whole scheme of the doctrine, discipline, and church government of the R. C. was settled in detail, and to which all members of the clergy, and all officials and dignitaries, are required to subscribe. The leading principle of the new constitution thus imposed in the R. C., is the absolute supremacy of the czar; and in order to mark still more signally the principle that the crown is the source of all church dignity and of all ecclesiastical jurisdiction, the arrangement of provinces, archbishoprics, and bishoprics underwent a complete revision; the old metropolitan sees, as they became vacant, were filled up with simple bishops, and not with archbishops as before; and a new arrangement of archbishoprics was established, partly by the act of the czar himself, partly by the interposition of the permanent synod.

The constitution of the R. C. established by Peter, has been maintained in substance to the present time. The Holy Synod is regarded as one of the great departments of the government, the Minister of Public Worship being *ex officio* a member. One of the most cherished objects of the traditional imperial policy of Russia, has been to effect a uniformity of religious profession throughout the empire. Dissent, in all its forms, has not only been discouraged, but in many cases rigorously and even cruelly repressed; and as the Roman Catholic dissentients from the R. C. form the most numerous, and the most formidable class, they have generally, but more particularly under the Czar Nicholas, been the object of especial severity.

As regards doctrine, the R. C. may be regarded as identical with the common body of the GREEK CHURCH (q. v.). With that church the R. C. rejects the supremacy of the pope, and the double procession of the Holy Ghost. All the great leading characteristics of its discipline, too, are the same; the differences of ceremonial which exist, although in many cases considered by the Russians themselves of vital importance, being too minute to permit our entering into the detail. There is one point on which some explanation may be required. The liturgy of the R. C. is the same as that of the church of Constantinople; but it is celebrated not in the Greek, but in the Slavonic language. The service books, however, are not in the modern Russian, but in the ancient language, such as when they were originally translated, with the exception of the modification which they underwent at the time of the patriarch Nikon (see RASKOLNIK, PHILIPPINS), and the further revision under Czar Peter. The discipline, as to the marriage of the clergy, is the same as that described for the Greek Church; and in carrying out the law which enforces celibacy upon bishops, the Russians adopt the same expedient with the Greeks, viz., of selecting the bishops from among the monks, who are celibates in virtue of their vow.

Besides the established R. C., there exists also in Russia a not inconsiderable body of dissenters of various kinds. One class of these has been already described under the head Raskolniks. But by far the most numerous dissenters are the Roman Catholics, who are found chiefly in Poland and White Russia. At the partition of Poland, a special provision was made for the Roman Catholic people of Poland, under the new government, by the erection of an archbishopric in communion with Rome, at Mohilew, in 1793; and the organization was still more formally completed by the czar, Paul, who established, in 1798, five bishoprics under that metropolitan see; and the arrangements of the Congress of Vienna having somewhat deranged these ecclesiastical dispositions, a new arrangement was entered into by Pius VII. in 1818. But it cannot be doubted that the whole policy of the Russian government, in reference to the church, makes it almost impossible that they should permit free exercise of worship and of thought to the Catholics in communion with Rome.

The direct legislation, and still more the practical administration of Russia in Poland, in reference to marriage, to church property, to conventual establishments, and to ecclesiastical regulations generally, has been a policy of repression and of compulsory proselytism. This policy has been more sedulously pursued since the recent reorganization of Poland. In 1867, the archbishopric of Warsaw was abolished, and all the Roman Catholics of the empire were made subject to the archbishop of Mohilew.

According to the St. Petersburg Calendar for 1876, the orthodox adherents of the R. C. were upwards of 60,000,000; while the Raskolniks numbered over 1,170,000. The Roman Catholics, including nearly 4,600,000 in Poland, amounted to about 7,500,000. The government's contribution for the maintenance of religion was upwards of £1,350,000.

RUSSIAN LANGUAGE AND LITERATURE. Russian, a principal member of the Slavic family of languages, first became a

written language in the time of Peter the Great, till which period the Old Slavic—the language of the Church—had been the only medium of literary expression, and had, in consequence, exercised an important influence on the Russian popular speech, as on that of other Slavic dialects. The Mongol conquest, and the preponderance of Polish elements in the western parts of the empire, have also introduced into the Russian language a great number of Mongolian and Polish expressions; in addition to which, the efforts of Peter the Great to give his subjects the benefits of western culture, have enlarged the Russian vocabulary, especially in arts and industry, with numerous German, French, and Dutch words. The chief characteristics of Russian as a language, are simplicity and naturalness. The grammatical connection of sentences is slight, and the number of conjunctions scanty. Perspicuity and expressiveness are obtained by the freedom allowed in the placing of words. Auxiliary verbs and articles there are none; while personal pronouns may or may not be used along with verbs. The vocabulary of Russian is very rich—foreign words being, so to speak, Russianized.

The capability of the language for forming compounds and derivatives is so great that from a single root not less than 2000 words are sometimes derived. The purest and most grammatical Russian is spoken in the center, about Moscow. The oldest Russian Grammar is that of Ludolf (Oxf. 1696); others are the Grammars of the St. Petersburg Academy (1802), of Gretch (Petersb. 1823; new ed. 1834), and of Vostokov (10th ed. Petersb. 1859). A *Russian Grammar for Englishmen* was published at St. Petersburg in 1822, and another (by Heard) in 1827. The best Dictionaries are those of the Russian Academy (4 vols. Petersb. 1847), of Heyn (1803—1805), of Schmidt (Lps. 1815), Oklekov (4 vols. 1825), Sokolov (Petersb. 1834), Reiff (1862), and Paulovski (1859). There is an English-Russian grammar and dictionary by Constantino (3 vols.).

The beginnings of Russian literature are contemporaneous with the introduction of Christianity by the missionaries Cyril (q. v.) and Method, who employed the Old Slavic church-tongue for literary purposes. To this earliest period belongs—besides the *Pravda Ruskoja*, a book on law—the noted history or chronicle of Nestorius. After the subjugation of Russia by the Tartars, knowledge withdrew into the shelter of the monasteries, whence proceeded several important historical works. During this period of foreign domination, the Russian people seem to have sought consolation and hope in writing patriotic ballads and songs about their great hero-king, Vladimir—the Russian Charlemagne—the most celebrated of which is *Igor's Expedition against the Polovci* (Berl. 1855). When at length the country was freed from the oppression of the Mongols by Ivan I., in 1478, Russian literature received a fresh impulse, but so tardy, nevertheless, were its motions, so circumscribed its achievements that up to the commencement of the 18th c., the only notable names that can be mentioned are the metropolitan Makarius (died 1564), who wrote *Lives of the Saints*, &c.; Zizania, the author of a Slavic Grammar (Wilna, 1596; and Matviejev (17th c.), who composed several historical and heraldic works.

The czar, Alexei Michailovitch (whose prime-minister Matviejev was), caused a valuable collection of Russian laws to be printed in 1644, and shortly after founded an academy at Moscow, in which grammar, rhetoric, poetry, dialectics, philosophy, and theology were taught. But from political causes, the Polish element now began to predominate in Russian literature, and continued to do so, more or less, until the time of Peter the Great, who made his native language the universal vehicle of communication in business and writing. He established schools and founded the famous St. Petersburg Academy. During his reign, the metropolitans Demetrius (b. 1651—d. 1709) and Javorskij (b. 1658—d. 1722); the archbishop Prokopovitch (1681—1736); Selij (d. 1746); the national historian Tatishchev (1686—1750); the poets Kantemir; and the Cossacks, Klimovskij and Danilov; were the most distinguished supports of literature. The first to place on a firm basis the Russian metrical system, was Trediakovskij (1708—1769). In the period that followed the death of Peter, the writer that exercised the strongest influence on Russian literature was Lomonossov, who first drew the lines of distinction sharply between old Slavic and Russian, and established the literary supremacy of the dialect of Great Russia. Among his successors, the poet Sumarokov (1718—1777) did great service in the development of the Russian drama; so did Kniashinin (1742—1791), whose pieces still keep their place on the Russian stage; while Wizin (1745—1792) ranks as one of the first prose writers of his age.—Some of his prose comedies are full of the most genuine humor. Other notable names in poetry, belonging in whole or part to this period, are Chersakov, Oserov, Prince Michailovitch, Dolgoruki, Chvostov, Petrov, Bogdanovitch, and Derzavin (q. v.), the first universally popular Russian poet. Prose literature, however, developed itself more slowly. Lomonossov was for a long time the model that was followed. Among the first to make a fresh reputation, were Platon, the metropolitan of Moscow, and

Lewanda (1736—1814), archpriest of Kiev; who distinguished themselves from the mass of their bombastic brethren by the strength and vigor of their thinking; the historians Schtscherbatov (1733—1790), Boltin (1735—1792), and Muraviev (1757—1807).

Still more important, in the same department, were the labors of the German, Gerh. Friedr. Müller, a native of Westphalia, who, in 1755, established at St. Petersburg the first literary journal. Novikov (1744—1818) gave a powerful stimulus to the book-trade and to literary productivity, partly by his professional zeal, and partly by the publication of a satirical journal, entitled *The Painter*, which was widely read.

A new epoch in Russian literature commenced with Alexander I., who was enthusiastic in the cause of education and progress. The number of universities was raised to seven; learned societies were also increased. The great ornament of literature at this period was Karamzin (q. v.), who freed it from the trammels of the pseudo-classicism, within which it had been confined by Lomonossov. His labors were continued by Dmitriev and Batushkov, while Shishkov combated with success the tendency to deprive the language of its Slavic character; and in the poetry of Shakovski, the national elements again re-asserted themselves. Along with these may be mentioned the historian Bolchovitchov (1767—1837) and the theologian Drosdov, archbishop of Moscow; the poets Koslov, Prince Alexander, Siachovski (d. 1846), one of the best comic authors of Russia, and possessed of amazing fertility; Gribojedov, Glinka, Prince Vjasevski (b. 1792), a celebrated song-writer, elegist, and critic; Davidov, and Gneditch. Mersijakov, who died a professor in Moscow, was a very able critic; while Chemmiev (1744—1784) and Krylov (1768—1844) rank first among the original fabulists of Russia. Bulgarin and Greshk belong rather to the most recent period of Russian literature—a period characterized by the predominance of Russian influences, and the complete absorption into the one national spirit of all minor and foreign elements. The late czar Nicholas labored with his wonted passionate energy in this direction.

Among the poets of this thoroughly Russian period, the most conspicuous and brilliant is Pushkin (q. v.), whose verses are a mirror of Russian life, in which we see shadowed forth the joys and griefs, the humor and the patriotism of the true Russian peasant. The most remarkable of Pushkin's contemporaries and successors are the poets Baratynski (d. 1844), Baron Delvig, Benediktov, Podolinski, and Lermontov; the dramatists Nikolaus Polevoi and Nestor Kukolnik, who drew the matter of their dramas from the national history; and Gogol (q. v.), one of the most illustrious names in Russian literature. Russian novels exhibit a condition of society in which barbarism struggles for supremacy with a superficial civilization. The best writers in this department are Bestushev, Bulgarin, Sagoskin, Vasili Ushakov, author of *Kirgis-Kaisak*, &c.; Count Solohub, whose novels give a graphic picture of St. Petersburg society; Prince Odojevski, Baron Theodor, Korff, Konst. Masalski, and Senkovski, reckoned one of the first journalists in Russia; Dostoevsky, and Pisemski, both of whom died in 1881; Turgeniev, known by numerous French and English translations; nor must the name of Alexander Herzen (q. v.), the 'liberal Russian' exile, be omitted. The delineations of Cossack life are too numerous for special notice, but they constitute quite a distinct section of the literature of Russian fiction, and are composed for the most part in the dialect of Little Russia. Great attention has also been paid in Russia, as in all Slavic countries, to popular songs and proverbs. The principal collections of these are by Novikov, Kashin, Maximovitch, Makarov, and Sacharov. The latest developments of Russian literature have been chiefly in the department of history, and among the most distinguished names are those of Professor Ustrialov of St. Petersburg, Professor Pogodin of Moscow, Polevoi, Vasili Berg (d. 1884), Lieutenant-general Michailovski Danilevski, Professor Snjegirev, Sreznevski, Slovov, Samuilov, Soloviev, Srojev, Neverov, and Arsenjev. Such philosophy as exists in Russia is an echo of the modern German and English schools, and therefore possesses no particular originality.

Advances in theology are hardly to be looked for as yet from a church so deeply sunk in ignorance and intellectual stupor as the Russian, yet nowhere is reform more urgently required. As writers on jurisprudence, Nevolin, Moroshkin, Spassowitch, deserve mention; amongst mathematicians, Simonov, Perevoschtschikov, Wesselovski; amongst physicists, Turtshchinov, Metschnikov, Sokolov, Kutorga, Kokscharov and as linguists, Vostokov, Biliarski, Buslajev. See Borg. *Poetic Works of the Russians* (Ger., 2 vols.; Riga, 1823); Gretsck, *Extracts from the Poets and Prose-writers of Russia* (St. Petersburg. 1821); Gretsck's *History of Russian Literature* (Petersb. 1823); Jevgenij, *History of Russian Literature* (Petersb. 1818—1827—1838); König, *Literary Pictures from Russia* (Stuttgart. 1887); Otto, *Text-book of Russian Literature* (Lps. 1887; translated into English by Cox, Oxford, 1889); Jordan, *History of Russian Literature* (Lps. 1846); Talvi (Mrs. Robinson), *View of Literature of the Slavic*

Nations (1850); Courrière, *Histoire de la Littérature Contemporaine en Russie* (Paris, 1875).

RU'SSIAS, ALL THE, the official designation of the Russian empire in Europe, was assumed in 1654, when the Czar Alexei Mikailowitch styled himself for the first time 'Tzar of All the Russias,' after his conquest of Little Russia and acquisition of Smolensk from Poland. This phrase at first included only Great Russia, White Russia, and Little Russia. *Great Russia*, formerly called Muscovy, which is by far the largest of these three divisions, includes the territory now comprehended in the 19 governments of Archangel, Olonetz, Vologda, Novgorod, Tver, Jaroslav, Kostroma, Pskov, Smolensk (partly), Moscow, Vladimir, Nijni, Novgorod, Kaluga, Toula, Riazan, Tambov, Orel, Koursk, and Voronetz.—*White Russia* included the provinces of Vitebsk, Mohilev, and the rest of Smolensk, and though long held by the Poles, was re-united to Russia at the first and second partitions of Poland (1772 and 1793). In 1793, it also received the accession of the Polish provinces which now form the governments of Vilna, Minsk, Kovno, Volhynia, Podolsk; and White Russia with these accessions was then denominated *West Russia*.—*Little Russia* contains the ancient Russian possessions in the south-west, which, in the middle ages, became independent under the Cossacks of the Ukraine, and were finally reunited to Russia in 1654; and is divided into the four provinces of Kiev, Tchernigov, Poltava, and Kharkov. During the 18th c., the countries wrested from the Turks, lying between Great Russia and the Black Sea, were formed into a fourth great division, under the name of *Southern Russia*. This last includes the districts occupied by the Don Cossacks, sometimes called *New Russia*.—*Red Russia* was a portion of the Russian principality of Galich (Galicia), and with the rest of it, was subdued by Casimir III. of Poland; it included what is now the province of Lublin, in the kingdom of Poland, and the eastern portion of Austrian Galicia, and is inhabited by Poles, and another and antagonistic people, called Russniaks (q. v.).

RU'SSNIAKS, also RUSSINE and RUTHENI, the name of a variety of peoples who form a branch of the great Slavic race, and are sharply distinguished from the Muscovites, or Russians proper, by their language and the entire character of their life. They are divided into the R. of Galicia, North Hungary, Podolia, Volhynia, and Lithuania, and are estimated by Schafarik at 13,000,000. They are almost all agriculturists, and, on the whole, rather uncultivated. Before the 17th c., they were a free race, but were then subjugated, partly by the Lithuanians, partly by the Poles, and for a long time belonged to the Polish kingdom. Their language has consequently become closely assimilated to the Polish. It earlier times it was a written speech, with quite distinctive characteristics, as may be seen from the translation of the Bible, published at Ostrog, in 1581, and other literary monuments. The R. belong, for the most part, to the United Greek Church, but in part also to the Non-united. They preserve many old customs peculiar to themselves, and much folklore, prose and poetic, very like that current in Poland and Servia. Of late the name *Ruthenians* has been chiefly reserved for the Slavonian inhabitants of Austria, on both sides of the Carpathians; and distinguishes them from their kinsman, the Little Russians of Russia. Dislike to Poland has led them to incline to the Russian language. In 1880, there were nearly 3,000,000 R. in Austria.

RU'SSO-GE'RMAN WAR, the name given by German historians to the last stage of the great European war against Napoleon, beginning with the Russian campaign of 1812, and terminating on the field of Waterloo. See NAPOLEON.

RUST, the name given to a disease of plants, which shows itself on the stems and leaves of many plants, and on the ears of grasses, both of the cereal grasses, and of many pasture or forage grasses; in brown, yellow, or orange-colored spots; and after destroying the epidermis of the plant, assumes the form of a powder, which soils the fingers when touched. R. seems to consist at first of small fungi of one cell, sometimes divided by a transverse wall, belonging to the genera *Uredo* and *Puccinia*; which, finally, breaking through the diseased epidermis, form a colored dust consisting of mere spores. The name R. is sometimes restricted to the *Uredo rubigo vera*, but it is doubted by some if this is not really a young state of a *Puccinia*. Not a few authors regard R. as an eruptive disease (*ecanthema*), which makes its appearance chiefly in damp weather, and sometimes extends so far as seriously to injure the plants affected by it, the mycelium and spores which appear in it being regarded as present accidentally, or in consequence of the disease. This, however, is the least probable opinion concerning it.—R. is sometimes very injurious to crops. No remedy is known for it; but it is certain that rank manures tend to produce or aggravate it. See UREDO.

RUSTCHUK, an important town of the principality of Bulgaria, and 70 miles west-south-west of Silistria, on the south bank of the Danube, opposite Giurgevo. Its position on a range of

hills, with its white chimneys, its mosques and minarets rising from amid forests of fruit-trees, give it a striking and picturesque appearance. The Danube is here about 2 miles wide, but its channel is marked with islets and shallows. R. has manufactures of meerschaum pipes, pottery, saddlery, leather, cloth, tobacco and silk, and is connected by rail with Varna. It was determined by the Berlin Congress in 1878 that the fortifications of R. extensive but not very important, should, like those of the other Bulgarian fortresses, be destroyed. Pop., of which nearly half are Mohammedans, 80,000.

RUSTIC OR RUSTICATED WORK AND RUSTICATION. The name of that kind of masonry in which the various stones or courses are marked at the joints by splays or recesses. The surface of the stone is sometimes left rough, and sometimes polished or otherwise dressed. Rustication is chiefly used in classical or Italian architecture, although Rustic Quoins (q. v.) are often used

Rustication.

in rough Gothic work. In the figure, *a* and *b* show forms of rustication usually applied to surfaces; *c* and *d* show rustic quoins with mouldings on the angles.

RUSTRE, in Heraldry, one of the subordinaries, consisting of a Lozenge (q. v.) with a circular opening pierced in its center. Ancient armor was sometimes composed of rustres sewed on cloth.

RUTA BAGA. See **TURNIP**.

RUTA CEÆ, a natural order of exogenous plants, consisting mostly of trees and shrubs, but containing a few herbaceous plants. The leaves have no stipules, are simple and entire, lobed, pinnate, or decompound, and are covered with pellucid resinous dots. The flowers are hermaphrodite, sometimes irregular. The calyx has four or five segments; the petals are equal in number to its segments, or wanting, or are united into a monopetalous corolla; the stamens are equal in number to them, or fewer by abortion, or twice or thrice as many. There is a cup-shaped disk. The ovary is sometimes stalked; it has as many carpels as there are petals, or fewer; there are generally two ovules in each carpel. The fruit consists of several capsules, cohering firmly or imperfectly.—There are about 400 known species, natives of the warmer temperate and of tropical regions. The *Diosmaceæ* are sometimes separated as a distinct order. A bitter taste and powerful odor are general characteristics. Rue, Bucku, and Dittany are examples of the order. See also **ANGOSTURA BARK** and **BRUCEA**. The barks of a number of tropical species of different genera, possess febrifugal properties.

RUTH, **BOOK OF**, one of the Hagiographa, placed in the Authorized Version, as in the LXX., between Judges and Samuel; and in the Jewish canon, as the second of the five Megilloth, coming after the Song of Songs. It consists of four chapters, and describes how Ruth, the Moabite widow of a Hebrew, Machlon by name, in the time of the Judges, became—by faithful, loving adherence to her mother-in-law, Naomi, for whose sake she had left her home and kindred—the wife of Boaz, and through him the ancestress of David himself. A fragmentary genealogy of David's house—of which the principal links only are given—forms the conclusion of the book, which is characterized throughout by the most naïve simplicity, and minute truthfulness of detail. If there be a tendency in the book—which is doubtful—it would naturally be to show how utterly even that strictest of prejudices, in the mind of ancient peoples, especially the Hebrews, against intermarriage with the 'stranger,' is vanquished by genuine human love and piety; nay, that the heroine of the tale, even a Moabite, was deemed worthy for her virtue to become the foundress of the royal house of Israel. Considering that the Book of Kings contains no details about David's genealogy, this book, apart from its indescribable natural charm, becomes a most useful historical record, and further supplies many items on the forms and domestic customs of a time about which we have such very scant information elsewhere.

The time of the events related mounts back to about a century before David, yet both the contents and tendency of the book show clearly enough that it was hardly written before the last

years of David's reign, if it was at all written in his lifetime. For a change had already taken place in the interval in the manners and customs of the people (cf. the 'in former time,' iv. 7), and the genealogy carried down to David, shows the theocratic significance he had acquired by the time it was written.

RUTHENIANS. See **RUSNIANS**.

RUTHE'NIUM (symb. Ru, equiv. 52—new system, 104—spec. grav. 11.8) is a metal discovered in 1843 by Claus in the ore of platinum. In most respects, excepting in its specific gravity, it closely resembles iridium, the colored reaction of the salts being almost without exception the same in both. For details regarding this metal, which is of no practical importance, the reader may consult Deville and Debray's 'Memoir on Platinum and its Ores,' or works on the chemistry of the metals.

RU'THERGLEN, or, by popular abbreviation, **RUGLEN**, a royal, parliamentary, and municipal burgh, in Lanarkshire, on the Clyde, three miles south-east of Glasgow. It consists of one long wide street and of several narrow streets or lanes branching from it at right angles. In ancient times it was a place of considerable importance, carried on a large traffic on the river, and embraced Glasgow within its municipal boundaries. Its trade is now mainly dependent upon that of Glasgow, and its inhabitants are employed in weaving muslins for Glasgow manufacturers, and in the mills, print, chemical, and dye-works, and collieries of the burgh and vicinity. Pop. (1881) 11,265. In parliamentary representation, it is one of the Kilmarnock district of burghs.

RU'THIN, a municipal and parliamentary borough of North Wales, in the county of Denbigh, eight miles south-east of the town of that name, stands on the summit and slope of a hill on the right bank of the Clwyd. The site of the ancient castle, said to have been built in the reign of Edward I., is occupied by a fine modern castellated edifice in Gothic. Pop. (1881) 8084.

RU'THVEN, **RAID OF**, a conspiracy of note in Scottish history, contrived and executed in 1582 by William, first Earl of Gowrie, father of the principal actor in the Gowrie Conspiracy (q. v.), in conjunction with Lord Lindsay of the Byres, the Earl of Mar, and the Master of Glamis. The object of the conspirators was to obtain the control of the state by seizing the person of James VI., then a boy of 16, and under the guardianship of the Duke of Lennox and Earl of Arran. The king being by invitation at Gowrie's seat of Ruthven Castle, the conspirators assembled 1000 of their vassals, surrounded the castle, and obtained complete possession of James. Arran was thrown into prison, and Lennox retired to France, where he died broken-hearted. The Presbyterian clergy warmly espoused the cause of the Ruthven lords, who received the thanks of the General Assembly, and full indemnity from a Convention of Estates. Nearly a year elapsed before the king regained his freedom. His feigned acquiescence in his position led the confederates so to relax their vigilance that he was enabled to throw himself into the castle of St. Andrews, whose keeper was in his confidence, and thus to become his own master. Gowrie and the other lords made their submission, and were pardoned; but soon afterwards a royal proclamation characterized their enterprise as treason. Gowrie was commanded to leave Scotland; but while waiting for a vessel at Dundee, he was drawn into a conspiracy to surprise the castle of Stirling, for which he was tried and executed.

RU'TILE, a mineral, which is essentially *Oxide of Titanium* or *Titanic Acid*, although generally containing a little peroxide of iron. It is of a brown, red, or yellow color; and is found massive, disseminated, in thin laminae, and in four-sided or six-sided prisms, which permeate rock-crystal. It is found also in granite, syenite, &c. It is used to give a yellow color to porcelain.

RU'TLAND, a town of Vermont, U. S., 50 miles S.S.W. of Montpelier. The chief industry of the neighborhood is the production of marble, which employs about 1500 men. Pop. (1870) 9884; (1880) 12,149.

RU'TLANDSHIRE is the smallest county in England; area, 94,889 acres; pop. (1881) 21,484. The Wash divides it into two portions, of which the northern is a somewhat elevated table-land, while the southern consists of a number of valleys running east and west, and separated by low hills. The principal streams are the Welland, forming the boundary on the south-east, and its affluents the Wash and Chater. R. has no manufactures, and its chief mineral production is fine building stone. The climate is mild and healthy, the soil loamy and rich, and there is hardly an acre of waste land in the county. It is not, however, a crop-producing, but a grazing country; and oxen and sheep are reared in great numbers. R., which abounds in pleasing scenery, contains many stately mansions, as well as a number of ecclesiastical remains dating from the Norman period. It returns two members to the House of Commons.

RUVIGADO, a town of the United States of Colombia, in the department of Cundinamarca. Pop. 10,000.
